OUR ADVERTISERS RELIABLE
We guarantee our subscribers against loss through dishonesty of any advertisers in the Cultivator. We do not attempt, however, to adjust trifling differences between subscribers and honest, responsible advertisers, nor will we pay the debts of honest bankrupts. Notice of complaint must be sent us within 30 days from date of the transaction, and the subscriber must have mentioned the Cultivator when writing the advertiser.

THIS WEEK'S COVER

The largest live oak tree in the world is given place on the cover of this issue. From items furnished by Commissioner Earle Mills of Butte County we are informed that it is named after Sir Joseph Hooker, an English naturalist. Its circumference at the ground is 25.70 feet; circumference eight feet above ground, 28.40; spread of branches, north and south, 200 feet; circumference of spread, 446 feet. It has been figured out that, allowing two square feet for each, 7885 persons could stand under its branches. California is a state of big trees.

FEDERAL AID FOR ROADS

Besides community, county and state road work, the federal government is encouraging road building as never before. In addition to many added appropriations to the original federal road act, new appropriations are to be made which will involve the improvement of over 10,500 miles of new roads at an estimated cost to the federal government of $92,000,000,000. The amount of federal funds available on March 1 was $72,900,000. This must be matched by the various states with an equal amount. Some of these roads will be built in national forests, but others are entirely outside of any reserve. These road funds will be available on July 1, and the aggregate sum, including state funds to be used on the dollar for dollar basis, is $198,000,000.

STATE LOSES GOOD MAN

F. B. Davison, for ten years in charge of the permanent state exposition at Exposition Park, Los Angeles, has terminated his connection with that unique exhibit. We believe there is no complete exhibit of the productive resources of any state shown in more artistic setting. Nearly every county in California is there represented, and if the county fails to put in the exhibit in an attractive manner it has been made so by trained men. Mr. Davison laid the foundation for this exposition and has continued with it until this time. He now retires to conduct his own affairs.

MAINTAIN THE QUARANTINE

The importers are endeavoring to move heaven and earth in order to secure repeal of present national quarantine regulations. Formerly the importers were strengthened by many of the larger nurserymen and plant dealers of the Eastern states. From reports now received it appears that many of the dealers and nurserymen are changing their attitude, for they are already seeing the benefits from the new regulations.

The American Plant Propagators' Association, with headquarters at Chicago, Illinois, is making a valiant fight for the retention of the quarantine. That association quotes from resolutions passed by the recent California Nurserymen's Convention held in Riverside. We are glad the nursery association of this state is right and is considered a power in a great nursery industry. Strength to the arm of Marlatt.

FLORIDA'S FIGHT

The California State Fruit Growers in convention at Riverside passed resolutions commending the wonderful fight made by quarantine officials of Florida and of the department of agriculture against the citrus canker, characterized by one of the speakers at the convention as the most malignant of all plant diseases of all times. The canker for a time threatened to wipe out the citrus industry of that state. The dread disease took orchard after orchard and many of the nurseries of the state, and it was either fight or quit. Being Americans the Floridans fought. They appealed to the department of agriculture for help. There is now no citrus canker in the state of Florida, but presumably it is not entirely eradicated and other cases may appear, but watch is kept to secure instant stamping out of the first appearance. Strength to the arm of the Florida fighters.

PIONEERING

All honor to the pioneers, to those who have taken up the battle of making a habitable land out of desert and foothill. They have been confronted by obstacles and by hardships. Nor is the work of the pioneer ended, for even today there are many in California confronted by problems as serious as the '49ers. A subscriber in San Diego County, Wm. H. Briggs, writes:

"It is a constant battle with the ground squirrels and birds to prevent them from destroying and packing away our nuts from the trees, and we are feeding their burrows and the crotches of the trees with poisoned barley furnished us by the farm bureau. One of our neighbors recently dug out a ground squirrel from under his barn and found a nest of 13 young ones, with a large quantity of chicken feed that the mother and father squirrel had stored up."

That was an unlucky 13 for that particular family of squirrels and decidedly lucky for the farmer that he terminated their existence before they had destroyed acres of valuable products. If that letter is an indication of one of the small problems which Californians are solving, it is also an indication of some of the methods which are proving successful.

WILL DEMONSTRATE

At the last meeting of The Tractor and Implement Dealers' Association of Southern California, after quite a lengthy debate on whether to hold a still or an active demonstration, it was unanimously voted to hold an active demonstration of tractors and implements, eliminating that part which has been termed the public plowing, which has generally developed into a speed contest which did not show the work as desired by the farmer. Under the plan adopted each exhibitor will be allotted space for private demonstrations to comply with desires of the prospective purchasers as to character of implements and depth of plowing.

After the voting, the members who favored a still demonstration came to the front and promised their full support, and the meeting as a whole was a complete success. The association, having secured the services of R. M. O'Neill, who so successfully handled the former demonstrations, is assured of a big success which will give the farmers of the state a chance to see real tractor action.

IRRIGATE

The more optimistic say that this year's production of California's walnut orchards will aggregate 25,000 tons, by far the largest crop ever. Prices will probably be the highest ever. The quality—that depends. It depends upon the determination of the grower. Every step should be taken which leads toward better conditions of soil, greater freedom from insect or other pests, or, as the scientists say, the optimum of condition to produce largest and finest of nuts.

Experts are making careful determinations as to what these steps should be, and the walnut grower who will open his eyes has the information at hand. But just a word from the Cultivator.

This last season the rains were so wonderfully well distributed that the greatest benefit was secured from them, but it still is true that the total precipitation was much under normal. The water was not actually placed in the soil, which is needed to supply plant growth. Hence, Irrigate. Irrigate deeply. Cultivate. Cultivate, not deeply, but keep the surface in such a condition of thorough tilth that the dust mulch will prevent the loss of moisture.

GOVERNMENT GUARANTEE

The farm center of the Livingston district of Merced County is discussing questions of farm crop costs and farm crop compensation, and has come to the conclusion that farmers are the only class of people, the selling price of whose product bears no relation to the cost of production. The members have decided that because of hazards incident to farming American native stock is being driven from the farm and that the drudgery is being performed by Asiatic or other labor, therefore,

"Be it resolved, that an authoritative and systematic determination of the cost of farm products be undertaken by state or national authority and that the selling price of such products be not less than cost plus ten per cent."

Unfortunately, the farming class is not the only one which has failures in its ranks. General business ventures yield only about three or four per cent of complete successes, according to statistics issued by reliable authorities. If such is the case and farmers are granted a ten per cent guarantee, we feel there will be terrific pressure for passing the ten per cent guarantee all along the line. The farmer asks and must have a square deal; he will not accept charity.

MORE GOOD ROADS

The bonds carried. Some time before Tuesday's election Governor Stephens remarked in an address in which he favored voting the $40,000,000 road bonds:

"Good roads have become a determining factor for the homeseeker. The building of good roads into our mountain counties will add an impetus to the development of those sections in fruit growing and other agricultural pursuits. We have a vast area of mountainous country in which farming and fruit growing are just beginning and highways that will solve the problem of transportation will unlock a great wealth for our state."

The biggest word in this address is that one, "unlock". We believe the roads built with the bonds voted on Tuesday will open the way for many a farmer to produce and to market where before he has been unable to get his produce into the market in condition and at a cost which left him any profit. California already has the best roads in the country and more of them than any other state unless it be a very few near the Atlantic. When the present $40,000,000 is spent under the efficient direction of the state highway commission we believe this state will be the peer of any in the Union.

TEST THE SEED

Why should an orchardist who proposed to plant melilotus seed for a cover crop to be plowed under next spring pay nine cents per pound when he can buy other seed identically the same, so far as his eyes can determine, for seven cents? Why should one pay more for one bushel of seed wheat, barley, corn or other seed than for another identically the same in appearance.

Easily answered by many farmers who simply say: "He shouldn't."

But there is another side to the question, which might change the answer. That side has to do with seed testing. Seed testing has to do with knowledge of the viability of the seed. Our state university stands ready to test seed and, we believe, without cost to the grower. The state seed bill has not become a law. Another two years' wait is necessary, but many of our best seedsmen have determined to sell seed with "certificate of quality," or guarantee not only as to purity of the seed but as to its germinating power. The seed buyer who is wise may well buy his seed subject to state university test. It costs but little for postage and minus but little delay, and by anticipating his need by this few days he is able to save dollars and perhaps save a year in time by securing satisfactory crop return.

Liquid Hydrocyanic Gas for Fumigation

SOMETHING over 25 years ago California orchardists gave to the world a method for destruction of injurious insects, which has saved millions of dollars and benefited orchardists in all fruit growing sections. The greatest benefit was to the citrus producer because the citrus trees, always in foliage, offered greatest obstacles to thorough work in spraying and offered most successful opportunity to secure insect control through fumigation.

In the earlier days of the industry the old time hoop tent gave most excellent results with small trees. A 30 or 40 foot seedling, however, made great difficulty in handling the tent, which finally brought about the construction of an enormous derrick which was mounted on trucks and hauled about through the orchard, tents being lifted from tree to tree. It was but a short time, however, before an improved pole hoist was provided, which made tent handling much easier.

The method of gas generation, however, changed but little from the first until perhaps a half dozen years ago. That method consisted of mixing water and sulphuric acid in an earthen vessel, and into this was dropped the lumps of cyanide of potassium, or later, of sodium. Then came the egg cyanide, which was simply ready weighed and standardized chemicals.

These first fumigations often resulted in serious injury to the tree, this because of chemical impurities. Chemists soon corrected this, however. Some five or six years ago the fumigation machine entered. This was simply an appliance charged with sulphuric acid in one chamber and dissolved cyanide in another. The mechanical mixing of the chemicals with hose from gas chamber to beneath the tent completed the operation.

Last year another change of method was made by many of the professional fumigators. It consisted of the use of liquid hydrocyanic acid. There was some danger connected with this form of application, but improved pumps or injectors have been devised which now makes the handling of this liquified gas comparatively safe to human life, and it is proving much more effective with scale and other insect pests.

These improvements have called for renewed investigations as to best methods of work. For years Prof. R. S. Woglum of the department of agriculture has been in California making investigations, principally as to effectiveness of various fumigation methods. Prof. H. J. Quayle of the University of California has also given much of his time to similar investigations.

To bring out the best of information Horticultural Commissioner H. J. Ryan of Los Angeles County invited commissioners from all citrus growing sections, inspectors, fumigators and orchardists to meet in Los Angeles, Thursday, June 26.

Professor Woglum explained the method of work with his chart, a reproduction of which appears on this page. As noted in the chart the unit of dosage is 18 cubic centimeters. The diagonal block of figures from upper left to lower right corner of the chart indicates the units. For instance, the first "2" in the upper left hand corner indicates that two units of dosage are necessary for a tree ten feet over and 12 feet around, while the "34" in the lower right hand corner indicates 34 units of dosage for a tree 58 feet over and 78 feet around.

F. G. Wyman of Pomona, S. A. Stowell of Charter Oak and Charles T. Paine of Redlands all spoke in commendation of the new liquid gas method of work. Two resolutions were adopted, the first calling for oversight of qualified inspector and the other asking for uniform regulations for field practice. The resolutions are:

Resolved: That this meeting of growers and others interested in the citrus industry, assembled in Los Angeles, June 26, 1919, recommends that the horticultural commissioners of the large citrus growing counties of Southern California, namely, Los Angeles, San Bernardino, Riverside and Orange, request their respective boards of supervisors to allow the appointment of night fumigation inspectors, and furthermore be it resolved that the growers of this meeting urge the said board of supervisors to allow necessary funds for such work.

Whereas, uniform field practice in fumigation of citrus orchards for scale insects is desirable and each county now requires the observance of certain regulations for field practice, which requirements however are not uniform in all counties, be it resolved that this meeting of growers and others interested in the citrus industry recommend that the county horticultural commissioners of the large citrus growing counties of Southern California, namely, Los Angeles, San Bernardino, Riverside and Orange Counties, acting as a committee with the state commissioner of horticulture or a deputy, take steps to draw up uniform regulations for field practice in fumigation, and that for the purpose of advising themselves of the practicability of requirements deemed necessary the horticultural commissioner of Los Angeles appoint two fumigators and the commissioner of each of the other three counties appoint one fumigator to act as a committee of five to furnish such advice on field practice as the horticultural commissioners may request.

Plowing When Oranges are Blooming

DOES deep plowing of a citrus orchard at time trees are in full bloom, or does heavy irrigation at that period, or other drastic cultural method have anything to do with reducing the coming season's crop? These are questions frequently asked, and so far diversely answered. One grower will notice great reduction in output of rows deeply plowed, while his neighbor notices no difference whatever. The past season caught many with cover crops still standing when trees were blooming. We hope we may hear from these growers as to what was the result of the cultural methods; also what is the result of the heavy irrigation. Let us have a growers' forum.

One inquirer who came to this office for information last blooming time was J. Frank Walters, with orchard properties in Los Angeles County. We have asked him as to his observations. Mr. Walters writes:

"Owing to a considerable acreage in groves and insufficient stock to properly plow, cross-plow, disk and cross-disk a heavy melilotus cover crop within the proper plowing season throughout all the groves, it was a problem last winter whether to plow some groves earlier or considerably later than is the usual practice.

"I concluded it best to sacrifice the melilotus on a few groves and began plowing early in January, turning under a cover crop only an inch high. The plowing and cross cultivation dragged along slowly and it was June 1 before the last acre of orange groves was finally put into good summer condition. This soil cultivation, therefore, took place while the trees were practically dormant, just prior to and during blossom time and up to beginning of setting of the young fruit.

"Groves plowed in January had received a heavy application of stable manure the year previous. The trees blossomed profusely (Navels) but the fruit dropped very early, should say a month earlier than Navels in neighboring groves. At present, with the June drop having about run its course in my section, should say these groves first plowed now contain about as many (or as few) fruit as Navel groves of my neighbors. But my fruit had dropped weeks before the hot weather of early June and I would have had no crop had there been no

Agricultural News Notes of the Pacific Coast

Northern California

Apricot packing plants are busy in Tehama County.

Contra Costa County will vote on good roads bonds for the county on July 26.

Placer County farm bureau is making plans for its county fair to be held this fall.

C. J. Pratt of Gilroy advocates the drying of apricots without cutting, treating them like prunes.

A vigorous mosquito abatement campaign is being taken up in the Durham Colony in Butte County.

Wool growers of Sonoma County report prices being received now: 60 cents for long wool; 53 for short.

Almond growers of Sutter County have formed an association to affiliate with the California Almond Exchange.

The Sacramento County farm bureeau will make an especial study of soil improvement during the next year.

A big demand for damaged beans is reported from Salinas. During the past week sales were made of 10,000 sacks.

The cannery at Yuba City has added many improvements and this year expects to pack 160,000 cases of fruit.

Cloverdale proposes a bond issue to supply funds for the purchase of a site for the holding of the annual citrus fair.

A grain fire west of Durham last week burned over 130 acres. The fire started from the auxiliary engine of a separator.

One hundred dollars a ton for green prunes is reported offered in Sonoma County. Between $70 and $80 is being paid for pears of first quality; for seconds, $48.

The San Joaquin County Poland-China breeders have formed a county association. J. F. Lehman is president and Sherwood Beckman, secretary-treasurer.

Peach growers who made long time contracts with the canners, some of them for as low as $25 per ton, have had the price raised to $45 by the Canners' League.

Tokay grape growers in the Lodi district of San Joaquin County expect the largest and best crop on record. Irrigation is finished. The season is two weeks ahead of last year's.

Packing companies, working with the local chamber of commerce, are planning to make Oroville a year-round center for the packing of fruits and vegetables. Housing facilities for workers will be the first item to be considered.

Demonstrating his faith in the future of alfalfa, Fred W. Kiesel, the Sacramento banker who has a 600-acre dairy farm at Natomas, has completed planting 200 more acres to alfalfa on land that for the last two years has produced an average of 31½ sacks of beans to the acre.

On the Natomas district last year about 100 acres of timber were cut flush with the surface of the ground and alfalfa seeded as an experiment by the Natomas Company. It was so successful that about 1,000 acres have been planted. It is expected that the willow and cottonwood stumps will rot in about two to three years and as this land is sub-irrigated, it was not necessary to level or sub-irrigate it.

Central California

Turlock will have bumper watermelon crop.

Clovis, Fresno County, now has a farm center.

Hanford shipped out its first full car of apricots July 11.

Fresno reports last year's San Joaquin Valley cotton crop all sold.

Reports of serious losses from tomato blight come from Tulare County.

Wine grape growers at Dinuba are receiving offers of $40 per ton for their grapes.

The Kerman farm center, Fresno County, is planning for making an exhibit at the county fair.

Oakdale, Stanislaus County, is planning to hold a community fair and festival some time in September.

Oakdale, Stanislaus County, is showing its rice crop in better condition than preceding years at this time.

The Tulare County Poultry Association neted $31,489 in business during the month of May, the biggest month yet.

The supervisors of Kings County have adopted an ordinance limiting loads which trucks can carry over the improved highways.

Active buying of wine grapes last week is announced from the Fresno district at a price $10 above that received the week previous.

Dairymen of Tulare County have taken preliminary steps toward the organization of an association to work with the state dairy council in boosting milk products.

Water users near Bishop, Inyo County, are preparing to fight the Southern Sierras Power Company for possession of practically all the waters of Bishop Creek.

Secretary C. A. Murdoch of the California Associated Raisin Company estimates the state's raisin production at 200,000 tons and of best quality if present conditions prevail.

Owing to comparatively low temperature, the citricola scale has shown great increase in Tulare County's citrus orchards. A fumigation campaign will soon be in full swing.

The creamery at Merced is now equipped to manufacture whole milk products in addition to butter, and the new equipment has called for new motor trucks for gathering whole milk instead of cream.

W. J. Higdon of the Tulare Holstein Farm has just received $125.75 in prize money from the National Association of Holstein Breeders for the remarkable records made on the farm during 1918. Mr. Higdon expects to make even a greater showing this year with the official tests now going on and in which seven-day and 30-day tests have shown greater promise of world records than last year.

In the Tulare district 159 new electric pumping plants have been installed by the Tulare district office of the Mt. Whitney Power and Electric Company, representing 1600 horsepower. As many or more gasoline plants have been installed during the same period. Minimum rainfall during the past three years has lowered the water level to some extent so that many of the pump pits have had to be lowered.

Southern California

Carpinteria's apricot season is expected to open July 15.

Riverside canneries are now running full handed on apricots.

A goat show was held at Pomona, Los Angeles County, last Saturday.

The last sale of 26 cars of Lima beans was made at $9 per hundred.

Pima cotton grown in Imperial Valley was recently sold in Boston at 52 cents.

Apricot growers of Nuevo, Riverside County, expect to harvest a crop of 1000 tons.

Cooperative auctioning is being encouraged by the farm bureau of Imperial County.

The Imperial Valley now has a committee in Washington working for the all American canal.

The Pomona Valley Goat Association held its second annual goat show at Pomona on last Saturday.

The Redlands district reports heavy June drop of oranges, but no more than will properly thin the fruit.

San Diego County's cow testing association is now under way under direction of County Adviser Weinland.

Hueneme bean growers have organized for the purpose of affiliating with the cooperative bean marketing association.

A new packing house for Fullerton, Orange County, is in contemplation. This plant will handle tomatoes and potatoes.

The Claremont Pomological Club held its annual picnic meeting at the Riverside experiment station on the last Saturday in June.

Members of the Santa Ana Walnut Growers' Association have just received checks for $55,000 as final returns for last year's nuts.

Santa Barbara is holding a five-day fiesta from July 1 to 5 in honor of the first landing of Portola and Father Junipero Serra at San Diego.

The apricot canning opened in Pomona on the last Thursday in June. The first fruit to be handled is brought from Banning and other early ripening sections.

A Ventura County bean grower has secured award of over $5,600 in suit to compel payment for beans contracted for and destroyed in fire at Santa Susanna warehouse.

Citrus growers of Ontario are appealing to the county and state horticultural commissions to do everything in their power to keep the dreaded meally bug out of the Ontario district.

Suit has been begun against the Imperial Valley Milk Producers' Association by one of its members, A. Wurthing. Specific charges are made against J. M. Henderson jr. and Harris Weinstock.

Riverside County's crop of apricots, according to estimates of Horticultural Commissioner Sharpe and Farm Adviser Wilson, will be about 23,000 tons. Of this the Hemet Valley is expected to yield 16,000 tons; the Banning-Beaumont district, 4000 tons.

Banning, Riverside County, has a new pre-cooling plant. Several carloads of fruit cooled there have been sent to Canada. The fruit will be thr[illegible]weeks on its way and will be t[illegible]nes reiced. Peaches, plums [illegible]pes will be treated in the same

The Coast and General

Portland strawberries are selling at $4.00 per crate.

There has been an unusually heavy June drop of apples in Kansas.

Yakima County, Washington, claims 700 head of pure-bred Holsteins.

The Elberta peach crop in Texas is estimated at over 1500 carloads.

The Cowlitz Valley Cheese Association has opened a new plant at Toledo, Washington.

A great boom is reported in the building of sweet potato storage houses in Texas.

A wool grower at Yakima, Washington, announces the sale of 1650 head of spring lambs at $10 a head.

The Santa Fe railroad estimates the cantaloupe output of the Rocky Ford district of Colorado at 1591 carloads.

A large number of farmers in the Castle Rock district of Washington are installing electricity on their farms.

In girls' canning clubs of Walla Walla County, Washington, 335 girls have this year enrolled, against 75 last year.

The Colorado Potato Shippers' Association has elected Z, J. Fort of Denver president and W. T. Richards of Denver secretary.

D. Zubeata of Winnemucca, Nevada, has made a sale of 7000 head of sheep to one purchaser. He estimates the worth of the wool alone at $17,000.

Yakima, Washington, pear growers have sent representatives of their association to California to learn as to California Pear Growers Association methods of drying.

Washington exects to break all records this year with its apple crop. The Yakima Valley expects 9000 cars; Wenatchee about 9000; Spokane from 750 to 800 carloads. The Spokane district shows some loss from the early frosts this spring.

Horticultural Inspector Miller of the Yakima district of Washington estimates for fruit of that valley, a yield of about 13,510 cars, divided as follows: Apples, 7500; pears, 3000; peaches, 2500; cherries, 60; prunes and plums, 200; miscellaneous, 250.

A rodeo to include a general round-up of Arizona cattle in the Agua Frio and Hassayampa districts to the junction of the Gila is to take place very soon. This is for the purpose of straightening out the ownership of estray cattle. It is expected that this rodeo will do away with some possible court actions.

As an outcome of the mass convention of farmers of the Northwest at Spokane recently, a second conference has been called of all the accredited representatives of the organizations participating to take definite steps toward forming an organization. It is estimated that 2500 persons were in attendance at some of the sessions of the big mass meeting.

Oregon fruit growers are getting together in an effort to take their fruit out from under marketing control of speculative buyers. An organization committee of 40 was appointed at a big meeting held in Portland June 20. This committee is to draw up articles of incorporation for a marketing association to be known as the Oregon Growers' Association.

The Ignition System

By James De Camp

ELECTRICITY is the animating force behind production and distribution today. We are at the mercy of the mysterious, capricious force that Franklin imported from the clouds. When the nerves of industry sizzle and crackle with its illimitable power all processes march forward toward completion. When there is "trouble on the line" action is paralyzed, completely and effectively.

The owner of a truck or tractor cannot attach too great importance to the functioning of his ignition and starting equipment. A slight oversight in inspecting the battery, tightening connections or patching worn insulation with tape may cause several days of delay and make it necessary to import an electrical expert from the nearest town.

The statement is gaining credence that at least 75 per cent of all motor troubles are located in the electric system. Many of these difficulties are the result of sheer ignorance and neglect on the part of the owner.

Perhaps the most mistreated and most maligned unit in the electric system is the storage battery. Many purchasers, particularly of second-hand machines, have been utterly and blissfully unaware of the fact that a storage battery was included in their equipment until the exacting box of "juice" ceased to function and its internals were found to be entirely wrecked.

The tractor is not usually equipped with a storage battery unless a starting and lighting arrangement has been built into the mechanism. Most trucks and practically all pleasure automobiles are provided with storage batteries, every one of which demands attention at least twice a month and sometimes more often.

The storage battery must have a drink of distilled water about every 15 days in normal weather and should be inspected more frequently in excessively hot spells. The battery makers specify that distilled water be used because the structure and functioning of the battery demand this particular kind of liquid. Faucet water invariably contains mineral secretions that will retard the current-producing properties of the battery and wear it down prematurely.

When pouring the distilled water follow a definite plan to be sure that none of the cells are slighted. Using a funnel begin at one end and go right through to the other, replacing the caps carefully to prevent damage to threading. When too much water is poured into a cell a medicine dropper proves very handy in removing the required amount.

Always be certain that the distilled water covers the plates and yet does not come up into the neck of the cell where the cap is inserted. If the tiny perforations in the cap are not kept clear of water and dirt that particular cell will not give maximum service. Test the caps occasionally with a pin or broom straw, but do not blow through them since the acid stored in the battery is capable of causing very sore and unsightly lips.

The machine owner who desires to know just how his battery stands should purchase an hygrometer. These instruments are inexpensive, a good one can be bought for one dollar, and leave no room for doubt. By registering the specific gravity of the liquid in the battery the hygrometer gives information that is definite and dependable. The instrument consists of a glass tube with bulb attachment in which floats an indicator with a graduated scale. Each cell must be tested carefully and the liquid drawn from it replaced before proceeding to the next. A specific gravity of 1.280 indicates normal strength, while a completely discharged, non-functioning cell will check in at about 1.150. With this instrument battery trouble can be forecast and nipped in the bud to prevent delay.

When a battery becomes worn down one should confer at once with a dependable service station, such as are maintained in the larger towns. Often a process of recharging will restore the battery for several months of use, the battery house supplying a "rent" battery during the recharging period. In other cases it is a great deal less expensive to cast the old equipment overboard.

Often the source of trouble is located in the generator instead of the battery. Keep your eye on the dashboard indicator to be sure that the generator is charging your battery. If trouble appears go over the wiring and connections. Beyond that point, unless one has a good technical knowledge of electricity, it is well to take the machine to an expert for inspection.

The magneto and timing apparatus likewise are good things to hang the "Keep Out" sign on. Most magnetos are thoroughly foolproof and require an infinitesimal amount of attention. Trouble that one believes to be located in the "mag" will usually be discovered somewhere else on closer inspection. If the timing apparatus seems to be kicking up a fuss the work of adjustment should be done by an expert, although some owners become intimate enough with the innards of their machines to do this ticklish job themselves. Misguided efforts at regulation usually cause aggravation of the trouble.

Engines that crank with difficulty on the magneto may be limbered up for starting by installing a dual switch and wiring up a set of dry cells to supply current for the initial explosions. When connecting up a bunch of dry cells place them in a container which will keep them as rigidly upright as possible. Be sure also that your wiring is tight enough to withstand road jars. When the engine refuses to start always glance over the cell connections to make sure that none have shaken loose. Remember that one dead dry cell on the line will prevent the other from delivering the spark properly.

Keep a large roll of tape handy. An inch of tape may save a yard of wire. Inspect all your wiring carefully, taping not only spots that show wear but places that are subject to more rubbing than others. Oil is an enemy of insulation. Keep your wires free from all drip or throw of oil or the insulation will soon show damage. Oil likewise is a good thing to keep away from the magneto. This instrument should be protected with a canvas cover as it is in a position to get gummed up from the valves or other parts of the mechanism.

This Month in the Vegetable Garden

Northern California

By A. R. Gould

WATERING, cultivating and clearing the ground for replanting will be the main features for the month. Keep the hoe and the ground busy and watch for the bugs at the same time, particularly the cut-worm and aphis.

Leeks and Celery

Those which were planted in the trenches last month should be kept well watered and if plants are still procurable from the nurseryman it is not yet too late to get them in, but the soil should have been very deeply dug and manured, trenches being prepared and the young plants planted in the rows about nine inches apart. Later on the soil is filled in to blanch or whiten the stalks.

Corn

A sucession of this popular vegetable should be maintained and a sowing made this month of Golden Cream or Golden Bantam, both of good quality. Those sown last month should be kept well watered, and where the cobs are forming on the earlier varieties arsenate of lead should be dusted on the young silk—in which the young worm or pupa lurks.

Beans

Sow again this month Golden Wax, Refugee and Kentucky Wonder for a later supply. Beans will thrive on sandy but not poor soil, hence your ground should be fertilized. You may still make a sowing of the small white Tepary bean.

Squash, Melons and Cucumbers

See that these do not suffer for lack of water and watch for any leaf eating pests. Dust with lead arsenate or spray, but avoid spraying the blooms or they will fail to set fruit. The warm weather will improve growth and help considerably.

Peas

In most sections it will be much too warm during the next month or two to grow this crop, and after the seed peas have been picked from the crops now coming in the ground should be cleared ready for other crops which may soon follow.

Carrots

Keep those sown last month well cultivated and thin out to six inches apart at least. They must have room to develop.

Tomatoes

These will need very little attention this month unless they are being trained. Then there will be considerable thinning out. Blackfly may also be troublesome, for which spraying should be adopted.

Parsnip

This useful vegetable sown last month as advised will be ready for thinning out to six inches apart in the row. Irrigate at least every week.

Peppers

Secure plants of the Bull Pepper and Red Chili and plant at once six to eight inches apart.

Parsley

Sow Moss Curled in rows or as an edging to the garden plots.

Brussels Sprouts and Kale

Sow seeds of Dwarf Perfection and Dwarf Curled kale. Both these will come in for winter use. Sow the seeds on a border or in boxes of fairly sandy soil and transplant later.

Southern California

By D. F. Reichard

THIS month will see the clean up of much of the early planted stuff. Potatoes should be dug as soon as the tops are well browned, not waiting for them to die. Potatoes left in the ground during the warm weather of this month will soon be spoiled from the effects of the heat. Put the potatoes as soon as dug in a cool dry place and cover with straw and two or three thicknesses of burlap or canvas to keep the light from turning them green, also to keep potato moths from getting at them.

Other crops that should be ready to clean up are peas, beans, root crops such as beets, carrots and turnips; early corn and onions. Harvest onions as soon as the tops fall over by pulling and placing in small piles, with a little trash over them to protect from the direct sun, to dry for a day or two. Remove the tops and place in shallow trays in cool dry place where they will keep for several months.

Where the crops are taken out soak up the soil well and work it over in readiness for late summer and fall crops.

There having been such a light rainfall this past winter we have to use great care in keeping the soil damp enough to foster continuous growth. Sow seeds as soon as the ground can be worked after wetting. Plant them nearly twice as deep at this time as in the cooler seasons.

During the early part of July melons may be planted for fall use; watermelons and casabas will come in during October. Muskmelons will be ready to pick in September. Cucumbers and summer squash can be planted any time this month.

Hill up around all vining plants so as to keep dry mulch for a couple of feet around the stems of the plants as well as to keep the irrigating water away from the center of the plants.

Make planting of either white seeded or Kentucky Wonder or Stringless Green Pod beans and sweet corn every couple of weeks for continuous use. Small planting of carrots, beets, turnips, lettuce and radish may be made to give a variety. Although these are not summer vegetables they will develop tender and tasty if grown in well prepared soil and kept well watered. Plant seeds of cabbage, cauliflower and kale for settings for mid-winter crops.

Watch all crops for their water needs. Be sure to see that corn does not want for moisture while the tassel is out, that is when the corn is making. Shortage of moisture means unfilled ears. Dust the silks as soon as they appear with dry arsenate of lead to destroy the corn worms. Cultivate all ground as soon as it can be worked after each irrigation. Keep tomatoes well cultivated and irrigate only as they show signs of needing it; they do better if given only a small amount of water until the fruit is set. Cucumbers require a good soaking at least once a week; they are heavy drinkers. The same can be said to a little less extent of melons and squash.

The hot days have done away with most of the pests, but it is well to always keep on the lookout for them and apply the proper remedy at once.

SPECIAL
TREES
For Replanting

We have a limited number of large Valencia Late Orange trees balled with extra large balls of earth that are just what you need for replanting the misses in your orchard.

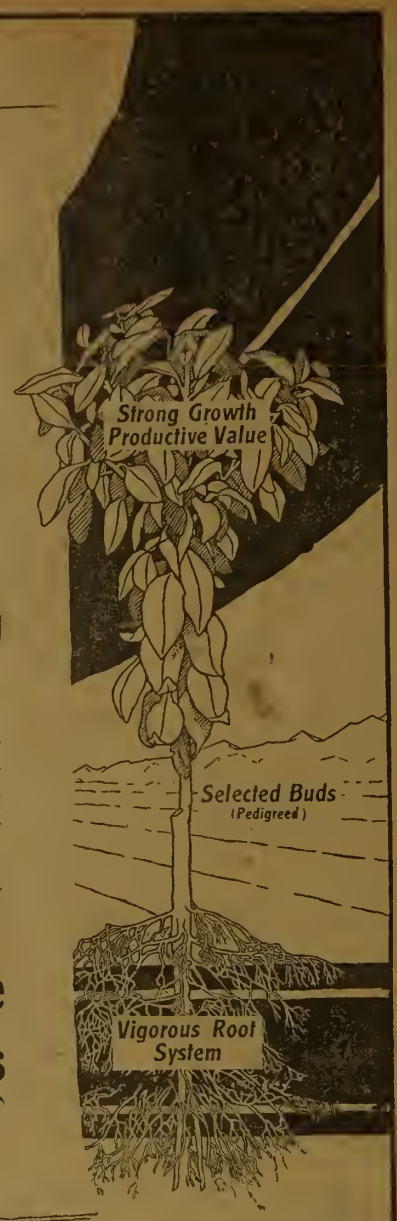
Ready For Immediate Delivery

Get what you want before they are all gone.

Our stock of yearling Navels, Valencias, Lemons and Pomelos in bud selected trees is complete and the best that can be grown.

Let us figure with you on your requirements.

The R. M. Teague Citrus Nurseries
San Dimas, California
Founded in 1889



PLOWING WHEN ORANGES ARE BLOOMING

Continued on Page 3.

heavy June drop. Am inclined to think this was caused by too early plowing and absence of proper aeration of the soil during blossom time and absence of a cover crop or fertilizer to carry the young fruit along. A light application of nitrate of soda, applied in March, was the only fertilizer past six months. However, Navel groves plowed in March have as little fruit today, even though in this latter case I turned under a good cover crop.

"Valencias are setting well, regardless of whether grove was plowed in January, March or end of May, excepting I notice that groves plowed very late in the spring are putting forth a second bloom while first fruit is now setting. In early spring I plowed sufficiently deep to turn up a fair but not unreasonable amount of citrus roots, but during and after blossom time I plowed shallow to avoid turning any more roots than absolutely necessary. The groves plowed early in January now show serious die-back and trees dropped most all spring growth of leaves, while the leaf was from five-eighths to one inch long. Do you attribute this die-back and loss of young growth and of fruit (long before the normal period for June drop) to the exceptionally early plowing, the small application of nitrate (1½ pounds), or to a fungus disease? The old leaves show a good, deep-green color and trees are practically free from scalybark, black scale or insect pest.

"From this experience I would insist, in future, upon deferring the plowing until there is a fair-sized cover crop to turn under, even if it were the end of June before the last grove is cultivated, rather than begin in midwinter and lose the value of all that a heavy melilotus cover crop means.

"Since writing the above I have had strongly verified reports of what I suspected a year ago from treatment of my Navel groves, namely, that the 10 to 15 tons of Camp Kearny stable manure I applied per acre had been treated with carbolic acid or some other strong disinfectant. This killed the soil bacteria and otherwise poisoned the soil. Previous to two years ago I had good crops of Navels; now I cannot get half a box on a 15 year old tree. It also seriously affected the Valencias, but not to the extent it hurt the Navels."

It will be noted hy Mr Walters' letter that exactly the reverse of the usual helief was true in his case, that is, the January plowed groves showed severe drop.

As to the cause of the die-back and loss of young leaves we will be glad for opinions of other orchardists. Mr. Walters does not say whether the carbolic treated manure was applied to these groves.

Increased Membership or Quit

THE California Prune and Apricot Growers, Inc., proposes to cease holding the umbrella for growers who refuse to bear their proportion of the burden of maintaining the market. The acreage in the association has been all too small and has prevented satisfactory accomplishment on the part of the association. Now the old members propose to quit or see the other fellow take a hand. From the statement sent out by the association we note that preliminary organization has been completed for waging a state wide campaign for increased acreage late this fall among the fruit growers of the state in accordance with the challenge sent out to the growers in a resolution passed by the board of directors at their last meeting.

The association, which at the time of its organization two years ago controlled 75 per cent of the state's prune and apricot acreage, demands that previous to exercising its options on the purchase of crops to be produced in 1920 and 1921 a greatly increased acreage be placed under its control, permitting it to maintain a firm hand in stabilizing the marketing of the crops.

This ultimatum placed before the growers threatens that the association, formed in the spring of 1917 to protect the growers from the ruinous market manipulations of the independent packers, will disband and go out of business unless a large percentage of the state's acreage is put under contract to the association.

Officers of the organization point out that if the association surrenders its charter the growers will lose all the benefits of cooperative packing and selling which, built up under the direction of the association, have practically eliminated speculative juggling of market conditions which in the past have kept the grower from getting full value for his fruit.

Much of the acreage not controlled by the association at this time consists of newly planted orchards, many of which will come into bearing the next two years.

The resolution as passed by the board of directors reads:

Whereas, according to the terms of the growers' contracts governing their delivery of dried prunes and apricots to our California Prune and Apricot Growers, Inc., said contracts' duration beyond the season of 1919 depends on our exercise of the option for deliveries of the crop to be produced in the seasons 1920 and 1921.

Whereas, in spite of expensive earnest effort on the part of said nization growers have not given idence of materially increasing or en maintaining in some instances our percentage control of these products, now therefore be it resolved in consideration of the above that this board of directors requires and makes the exercise of options on members' crops of the seasons of 1920 and 1921 contingent on the securing of similar contracts with growers representing a materially greater acreage of prunes and apricots, such specific requirement to be named in actual figures after the completion of 1919 deliveries.

And further be it resolved and requested that our organization department make proper preparation for a campaign in all districts, such as will properly present this requirement to the producers of prunes and apricots in all districts of the state.

Representatives of the association's organization department already are in the field working on the formation of local committees which are to wage the new membership drive later on this fall. The representatives in addition are soliciting growers to sign contracts at the present time and will be reinforced immediately by others who are to aid in laying plans in every prune and apricot county in the state for the launching of the campaign.

PEACH CONTRACTS

It was decided at a recent meeting of the Canners' League that peach growers who are under contract will receive $45 per ton this year for their peaches. The growers contend that cost of production has about doubled in the past few years and some time ago took the matter of increased prices up with the canners. It is stated that some of the growers last year had contracted for as low as $25 per ton, while those who have signed contracts this year for their year's crop are receiving $80 per ton and more.

Planting of tobacco in Butte County is reported to have been a commercial success.

AKRON

This Month in the Ornamental Garden

Southern California

THE "dry farm" gardener is pretty well done with his season's work. The lippia or Bermuda lawn may still show a bit of the green, and the geraniums and hardier desert plants may still show a little bloom. On the other hand, the garden with irrigation possibilities may still show some wondeful results notwithstanding a few hot days in June. But it sure does take the water this year. The light rainfall is now fully apparent, and the blue grass lawn suffers over-night and still worse in midday heat unless copiously drenched, for there is but little water to "come up" from the sub-soil.

In irrigating flowering shrubs and plants, most plants do best if the sprinkler is put away and copious soil irrigation in ditches, or otherwise, given. Cultivate in and mulch to save this moisture as long as possible. If sprinkling is done with such flowers as dahlias the warm sunshine soon finishes the particular flowers touched by the water.

The bulbs of the narcissus, in fact, all the spring blooming bulbs, may be lifted and put in moist sand and stored in shade or the coolest place possible for planting next November. Even the iris may be taken up and subdivided, but with these plants it is perhaps better to place in their next season's permanent location. The iris may be allowed to go till well toward the last of the month before making this division. The season seems to be exceptionally favorable for gladiolus, which is showing a wonderful wealth of bloom now. The seed of marigolds, phlox, scabiosa, coreopsis, cosmos, Canterbury bells, centaurea and various annuals may still be planted.

One may soon begin to withhold water from the roses from which a great wealth of holiday bloom is expected. This method is to withhold water until the stems the size of lead pencils are showing material shriveling. When that point is reached severe pruning back fits the plant for sending out new growth, which it does in the fall months.

Northern California

By A. R. Gould

CLOSE attention to details is necessary this month if a continuous display of bloom is to be maintained and watering, mulching, cultivating and fertilizing are all important. Seed for fall and winter flowers may also be sown and some subjects may be propagated. We would once again impress upon our readers the importance of careful watering for lawns. The sprinkler should be moved evenly over the surface and each section given a good soaking, otherwise there will be brown spots, which make the lawn unsightly. All weeds should be removed at the early stages or they will cause much trouble as they quickly seed during the hot weather. Climbing roses will need tying in and the weaker shoots should be removed to encourage growth in the main leaders. Quite a few subjects will require staking, especially in the perennial border.

Annuals to Sow Now

On a semi-shaded border sow the following useful flowers which will brighten your garden for the fall: Godetia, crimson and double rose; Clarkia, Purple Prince and Scarlet Beauty; silene, pink; stocks, Mammoth Nice, Summer Night (deep purple), and Monte Carlo (yellow); antirrhinum, Black Prince, Golden Queen and Defiance (an orange shade much admired); linum or scarlet flax and Linaria hybrids. Most of these are very useful for cutting and are hardy.

Subjects for Propagation

Pentstemon, dahlias, carnation, phlox (perennial) and buddleias all may be propagated by cuttings placed in sand and water as required. The sand should be pressed firmly around the cuttings and they should be shaded during the day from the hot sun.

Dahlias

Complete the planting out of all seedlings and support with stakes all those planted earlier. The plants should also be disbudded to secure the largest blooms. There are usually three buds at each terminal and the two smallest must be taken out. If black or green fly are troublesome spray the plants with Black Leaf 40. Cut-worms are often a pest on these and destroy the young shoots near the ground. An application of strong tobacco dust will prevent them from causing much damage.

Delphiniums

These beautiful flowering perennials are just now at their best and will need stakes for support. If the dead flowers are removed and the plants cut down within 12 inches of the ground new shoots will quickly develop and provide flowers later on. A good mulching with manure should also be given with frequent watering.

Perennial Sunflower

Helianthus augustilolius, the perennial sunflower, was raised from seed by the writer, sent for trial from the department of agriculture last year, and was flowering in eight months. It is a wonderful yellow, growing four feet high and is of graceful habit. As a subject for the perennial border it is of great value and equally so as a fall cut flower. When better known it will become very popular.

Porch and Window Boxes

Nothing beautifies a residence more than tastefully arranged window boxes with flowers, and if these have not already been planted the following may usually be secured from the nurseryman: Ivy geranium, lotus, Evergreen Boston ivy, Tradescantia, asparagus sprengeri, all fine trailing subjects. Lobelia blue, used in combination with begonias, salvias. Marguerites, dwarf French marigolds, petunias, ageratum and zinnias, all make a bright display the summer long. Boxes should be deep and well filled with rich soil, not forgetting the drainage at the bottom as without this the soil will soon become sour and water logged. On the shady side of the house ferns may be used instead of flowering subjects. Seeds of nasturtiums may be sown now in small pots and in a few weeks may be planted in the window boxes for fall flowering.

SHORT COURSES

The University of California announces not only its usual short courses at Berkeley and at Los Angeles but summer session at the university farm, Davis, and at the citrus experiment station, Riverside. The Davis and Riverside courses are designed to prepare teachers and prospective teachers of vocational agriculture to meet the special requirements of the state board of education. The course at Riverside will lay special stress on citrus culture.

CULTIVATING

The Killefer people, makers of cultivators and things, together with their wives and kiddies, devoted one day last week to developing the social side instead of the material. It was the annual picnic of the company held at Santa Monica canyon. There were pie-eating contests until no further cultivation was required along that line.

- and in the front wheels, too

In this Parrett Tractor Hyatt Bearings are used in the front and rear wheels, on the reverse idler and on the fan.

Hyatt Bearings are not limited in their use to any one part of the tractor.

In the front wheels—as in any other location—the extreme severity of farm work has only emphasized the fact that Hyatt Bearings, without ever requiring adjustment, provide a continuous care-free, thoroughly efficient service that outlives the tractor itself.

Questions and Answers

ANSWERS BY EDITOR AND STAFF

Questions to be answered in this department should be received at the office one week before reply is expected. Write plainly on one side of the paper and sign full name and address. Unsigned communications receive no attention.

Summer Pruning of Vines

Because of inquiry recently answered in the Cultivator regarding summer pruning of vines we sent request to Prof. Bioletti for the latest information. Prof. Bioletti writes:

"The summer pruning of bearing vines is a more or less complicated subject which it is hard to treat within the limits of a letter. Certain kinds of summer pruning, such as the removal of suckers from the main trunk and below ground are necessary in all cases. The kind of summer pruning which is usually, if not always, injurious is the severe cutting back of the growing canes from the head of the vine. The only case where this is by any possibility useful is where the winds are so strong that unless we cut off the quarter or half of the cane the wind will take the whole of it off. The removal of any considerable quantity of leaves is always weakening to the vine and therefore diminishes its possibilities of bearing. However, some vines grow so vigorously that they fall to set their blossoms. This seems to be a general rule in plant growth. If such is the case moderate summer pruning consisting of removal of the extreme tips of the shoots before blossoming sometimes results in increased bearing. In Bulletins 241 and 246 you will find this question of summer pruning discussed from the theoretical standpoint quite fully. In Bulletin 296 you will find an account of some practical tests of the effect of various degrees of summer pruning under special conditions."

The bulletins referred to may be had by writing State Experiment Station, University of California, Berkeley.

Corn Ear Worm

Will you please tell me the best time during the growing period to spray field corn with arsenate of lead? Would spray applied to quite young plants have prevented worms eating into the undeveloped flower now?—Subscriber, Ramona.

The best time depends entirely upon the condition of the crop, the first application of lead to be when the silk begins showing fully. This treatment is repeated every few days. It is comparatively inexpensive and most beneficial.

Millet

Is millet a profitable crop to grow in California? Especially is it desirable for young chicks or for poultry? —Subscriber.

This question was referred to Prof. J. E. Dougherty of the University Farm, Davis. Professor Dougherty writes:

Since millet is a very hard seed containing a very tough, fibrous seed coat and since it is also a very expensive feed which does not possess any special feeding value warranting its use at the price at which it sells, we do not feel that millet has any place in the chick ration. Other more common poultry grains are equally good and often much better from the standpoint of nutrition and cost much less.

(See answer to same question in last week's issue).

Fungus Affecting Squash

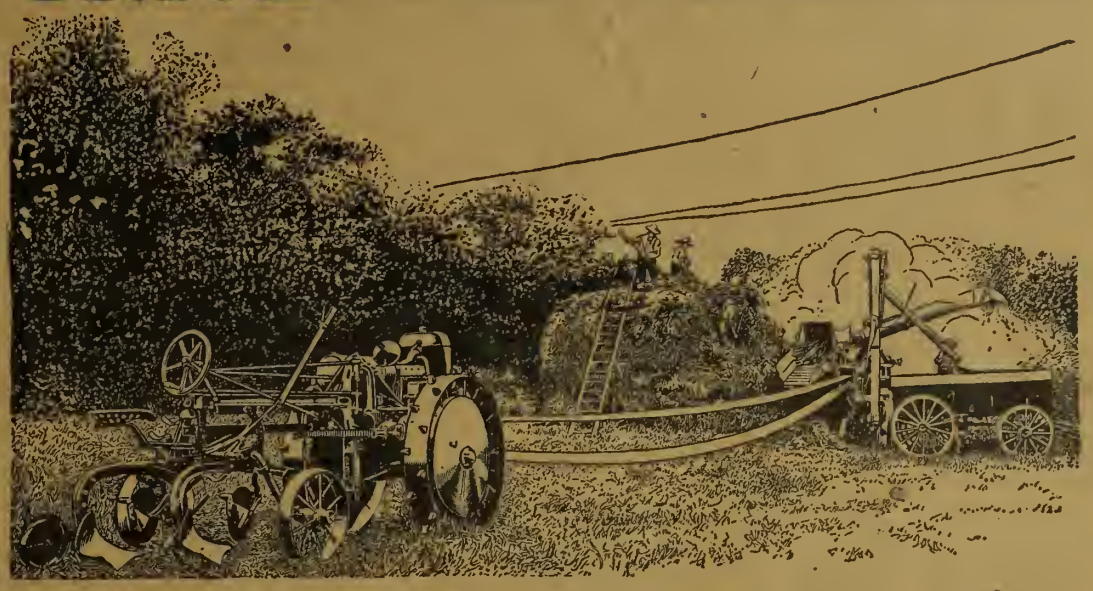
A Burbank subscriber is having trouble with his Hubbard squash vines. He says he has 7½ acres and every day sees a great number of them droop and die. These hot days it seems but a few minutes after they first show signs of wilting until they are a crumpled, wilted heap. Some of the roots are badly decayed and a ball made from the earth near these roots showed growth of white fungus. He often, but not always, finds this near the plant.

This problem was submitted to Prof. H. S. Fawcett of the Riverside experiment station and he writes:

The specimen came in yesterday

Continued on Page 23

MOLINE UNIVERSAL TRACTOR



Saves 1⅓ Men and 5 Horses Per Farm

Through the most comprehensive tractor survey yet attempted, we have found by figures from Moline-Universal Tractor owners—not by guess work—that the Moline-Universal actually saves an average of one and one-third men and five horses per farm.

Over 200 farmers in 37 states from Main to California and North Dakota to Texas were closely questioned, and their farms ranged in size from 40 to 800 acres. Every one of the Moline-Universal owners whose data forms a basis for these conclusions was selected at random from our list of owners, so that these results are average—not exceptional.

That the Moline is really a Universal Tractor and fits any size farm is proven by the fact that the farms reporting ranged in size as follows: 8%, 100 acres and under; 37%, 100 acres to 200 acres; 21%, from 200 to 300 acres; 13%, from 300 to 400 acres, and 19% above 400 acres. In their report 76% agreed that they could use the Moline-Universal wherever they used horses, and 83% said they could do better work—and thereby make more money.

Owners are positive in their statement that the Moline-Universal is a good investment, and 73% of the Moline owners state that they wouldn't farm again without the Moline-Universal Tractor, while the rest say that they would dislike to go back to horses.

In reply to the question, "Can you operate and maintain the Moline-Universal Tractor for what it would cost you to keep three or four horses?" Ninety-two per cent replied "yes." Many reported they could do so for less.

Space does not permit a complete report, but surely these figures must convince farmers and business men who believe in facts instead of theory that the Moline System of Power Farming is the most economical and efficient, and this is the reason why thousands of Moline Power Farmers are making more money with less hard work. Complete report of this tractor investigation will be gladly furnished on request.

ACME Feed Cutters

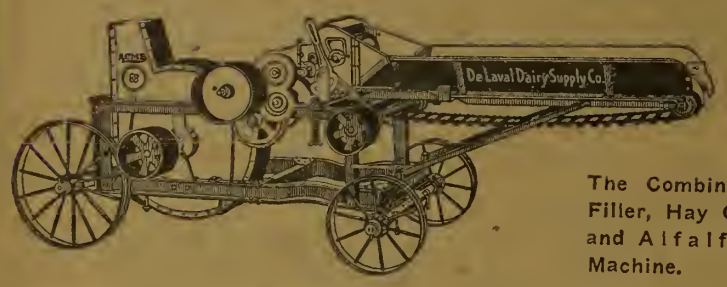
RELIABILITY

THE name "Acme" on a feed cutter is a guarantee of its reliability, for we have made it our creed to offer dairymen machinery which embodies only the soundest engineering practice, the best materials and the best workmanship.

The Light-Running Acme

has proven its superiority to thousands of dairymen in the five essential requirements of a reliable feed cutter and these are:

1.—Quality Cutting 2.—Convenience
3.—Durability 4.—Safety
5.—Light Power Requirements



The Combined Silo Filler, Hay Chopper and Alfalfa Meal Machine.

Selecting a Breed and Herd Materia

WE quote the following from a letter just received:

"I have in mind starting a small herd of beef cattle. Because of limited capital I must necessarily begin in a small way. The question that confronts me is what breed to select. Every man I ask has a different opinion. From whom am I to get the essential knowledge of breeds that is important?"

The question asked almost answers itself, yet is one that comes to us as often as any. Every beginner naturally wants the "best" breed—but when there is no "best" breed what is the answer to it?

The very fact that there exists a number of breeds of horses, beef cattle, dairy cattle, sheep and swine, and that each breed has its enthusiastic supporters should be sufficient evidence that no single breed is best in the sense that the beginner seeks to find.

The various breeds have been developed from a common ancestry, largely as a result of local condition, and have been developed with the idea of producing a type of animal that would prove most efficient under those conditions. As the breeds have progressed and gained a wider field, meeting each other under the same conditions there has naturally been a narrowing of the points of variance until now there is not a wide difference in any of the leading breeds. Of course the difference is still marked to a certain extent. Each breed can usually boast of some one or more superior qualities over the others, but no breed has all the good qualities to the exclusion of its contemporaries. One might just as well set out to find the "best" wagon or mower or binder or tractor—or religion or political party! As long as men are put up on the present plan there will continue a difference of opinion as to what constitutes merit.

Our advice to one planning to enter the pure-bred livestock business is to keep an open mind as long as possible—one will lose it soon enough once he decides on a breed—but if he has formed a special prejudice fo a particular breed, that is the breed to handle.

The writer feels that a sound policy for the novice to pursue is about a follows:

Recognize the fact that there is no one best breed—that all are good Consult experienced men in the locality in which it is proposed to operate. If it is found that the majority of cattle, sheep or hogs represent one breed over another it is safe to assume that there is a reason for such a condition and the chances are that reason is that experience has demonstrated the efficiency of that breed under the local conditions. Such being the case the wise thing to do would be to handle that breed and not permit personal prejudices to sway one too far. On the other hand, if one plans a breeding establishment in a new field, his first efforts should be to survey his possible outlet and determine which breed appeared to bo in the greatest demand and why that demand existed.

It is not good business to let one's personal prejudice get the better of his judgment. If there appears a marked demand for a certain breed and that breed is not your favorite—but your open mind permits you to recognize its many good qualities—breed the kind that you can sell to best advantage. At the same time bear in mind that your local conditions—the type of farm, etc.—should be considered.

The really important question to consider in starting a herd or flock is not so much the question of breed as the matter of selecting good individuals within the breed. How this can best be done is a problem the solution of which rests principally on the individual and can be gained by the beginner only through careful study and observation. To become familiar with breed type is not a matter easy of acquisition, neither is a knowledge of bloodlines.

There has been so much misinformation circulated regarding the possibilities of agriculture and livestock production that many men have formed the idea that the game is easy—that all one needs is a little hastily acquired knowledge—picked up from casual conversation or from books and papers. What the Cultivator continually seeks to impress on those interested in starting in the livestock business is that the business of producing livestock is in no way different to most other businesses; that the same fundamental principles that govern other lines of business operate in the livestock game—and no definite formula for success can be given. Heaven knows that we would be glad to give such a formula if we had one, but the fact remains that it cannot be done—notwithstanding that some make an attempt.

What the beginner wants is specific directions and when he is answered in generalities he is disappointed—yet he would hardly expect to get definite directions as to how to become a successful banker, lawyer, doctor, or what not—and expect to succeed.

Once the breed is decided upon the beginner should concern himself with becoming familiar with the modern type and the history of the breed Many of the breeds are subjects of special history, the others can be found, more or less, extensively discussed in general livestock books. A study of the history of a breed will serve to arm the beginner with information that is quite indispensable if he is to progress in the business Such study will enable one to better judge the value of a pedigree—and ability to distinguish between a good and bad pedigree will be of the highest value when making selections of breeding stock. Another means of becoming acquainted with breed history, past and current, is through the breed journals published in the interest of a particular breed. Most of the important breeds support a breed organ. Another means open to the beginner is consultation with established and reliable breeders. Most breeders are only too glad to advise the new man—especially if he will come to them and frankly ask their

Hogmen---Dairymen--- Do you want to get the most value from your feed money?

Do you know how much of the high priced feeds you buy are lost by not being digested? You can stop this "feed leak" and get more pork and more milk by using

Quick-fat FEEDS

Because they are concentrated and partially predigested.

They Digest Easily

There are no substitutes for the best grains and meals. High grade materials will always produce the best results. All Quick Fat feeds are of the highest quality of pure materials—no filler or mill wastes, and are absolutely guaranteed.

QUICK FAT
Complete Hog Feed
The highest possible quality.
Nothing but the pure grains, meals and buttermilk, combined with Quick Fat.
No filler or mill wastes.
It goes farther and gives greater efficiency.
Analysis and quality guaranteed.
Why not try a few bags?

They have the highest degree of digestibility. One trial will prove this to you. As the Japanese say, "One seeing is worth one hundred hearings." See for yourself.

QUICK FAT
Alfalfa Meal and Molasses
The highest possible quality.
Only No. 1 alfalfa, free from foxtail and other impurities, combined with Quick Fat.
Also furnished without molasses.
Has greater digestability and higher feeding or nutritive value.
Why not try a few bags?

Try a few bags of Complete Hog Feed or Alfalfa and Molasses. If your dealer does not carry it as yet, write direct to the factory for prices and full information.

Manufactured and Guaranteed by **I. S. CHAPMAN & CO., Inc.** Chapman Building San Bernardino, Cal.

advice. Of course, it goes without saying that livestock journals should be studied, likewise it will be found advantageous to secure sale catalogs and reports and show reports. By careful study of such papers and reports a working knowledge can be secured of the bloodlines held in highest regard by the purchasing public and of the bloodlines that appear to be responsible for the largest number of winning animals.

Another way to acquire breed knowledge is to study the literature issued from time to time by the different record associations. Such literature sets forth the story of the breed's development and the claims made for the breed—some of which should be assimilated with the proverbial grain of salt.

No man can hope to become a successful breeder of any kind of livestock until he develops an ability to recognize merit in breeding animals. In other words a breeder must be a judge. It matters little how well grounded a man may be in breed history unless he can apply that knowledge in a practical way he can not go far in the business. A mere knowledge of prejudices is not sufficient. The ability to judge livestock is not given to all. Some men and women are born livestock judges, some develop the faculty and others never acquire it. The writer is not one who believes it possible to make every man a judge, but he does believe that the average man interested in livestock can become fairly proficient through study and observation. The various agricultural colleges offer highly satisfactory courses that ground one in the fundamental principles of judging, but such training is not possible for the average man. This being the case, counseling with recognized judges, attending shows and fairs, study of illustrated livestock journals, supplemented with careful study of the principles of judging as given in a number of text books, will enable one to develop. This fact should be borne in mind, however, it is not possible to gain judicial ability by confining one's study to any one book or set of books. It should also be remembered that livestock judging is not an exact science—even the best judges do not always agree. Neither can one acquire such knowledge in a brief time.

One of the most certain methods of gaining a conception of the accepted type is by attending the leading livestock shows and fairs. These shows set the standard for all breeds and afford the best opportunity for comparing the merits of the different breeds. At the same time the beginner can make the acquaintance of the leading breeders. The chance to visit the best collections of a breed should not be overlooked. A day spent in the barns and pastures of recognized establishments can be made highly profitable. In this connection it is well to caution the prospective breeder against being too diffident in admitting his lack of knowledge when visiting a breeder of experience. The average breeder can be trusted to give sound advice to the new man and most of them are only too anxious to help if their counsel is sought in a frank way. We mention the above because it has been observed that very often a beginner endeavors to impress upon a more experienced man that he really knows considerable.

The writer has not sought to discourage the beginner from entering the livestock business, it is a wide and growing field in which there is room for all, but he has sought to point out a few of the primary fundamentals with the hope that an appreciation of them will guide the new man around some of the mistakes so often made, and make plain that there is no one universal best breed and to suggest that the big problem is not so much the selection of a breed as the selection of desirable individuals for breeding material.

New Berkshire Record

In a consignment sale of Berkshires held at Lowell, Massachusetts, the boar, Baron's Successor, consigned by Hood Farm, was sold to L. E. Ortiz for $6000—the highest price ever paid for a Berkshire boar at auction.

Record Ayrshire Sale

Not to be outdone by other breeds in the game of record smashing, the Ayrshire established a new record when 44 head sold in a consignment sale at Springfield, Massachusetts, for an average of $1630. Lotus Jean Armour, a five year old cow, topped the sale and sold for the record price for the breed, $8100. Highland Polly fetched $7500.

E. B. McFarland, proprietor of the Steybrae herd at San Mateo, selected Maple Leaf Lilly, for which he paid $825. McFarland also secured the cow Otterkill Betsey in the New England sale at Springfield.

Change Breed Name

At a recent meeting held in Chicago the members of the Polled Durham Breeders' Association voted to change the official name of the breed from "Polled Durhams" to "Polled Shorthorns," and the name of the association will be "The American Polled Shorthorn Breeders' Association."

Polled Shorthorns have been developed within the Shorthorn breed and when the breed was established the term "Durham," by which old time Shorthorns were commonly known, was adopted.

Why Keep the Other Eight Head?

If the calves from four pure bred Shorthorn cows will sell for as much as the calves from 12 good grade cows what is the object of keeping the other eight grade cows? Feed is high and so is labor. It costs something now to carry an animal through the year. Whether beef is selling unusually high or lower than the average it is a safe proposition that the calves from registered cows will, one year with another, bring in as much to the owner as the 12 calves from grade cows. That means that the pure bred man will feed four cows and their calves as against the grade man feeding 12 cows and their calves. As the calves would ordinarily be marketed at from 12 to 18 months, it is easy to arrive at the comparative cost of maintenance. It will pay to work toward the pure bred standard. And remember this, no matter how long you breed grades or how well they are graded up they will always be grades—and sell at grade values. You will get paid for whatever improvement you make, but the short cut is with the pure bred registered animal.

Interest in Duroc-Jersey Sale

The Duroc-Jersey breeders of Tulare County are well pleased at the interest being displayed in their coming sale which will be held July 16. That the demand for good Duroc-Jerseys has been steadily increasing in California is attested by the fact that practically all the breeders are sold down to pigs of spring farrow. Allen Thompson, president of the organiza-

Summer Advantages of the DE LAVAL

The superiority of the De Laval Cream Separator is more apparent and is more appreciated during the summer months than at almost any other time of the year.

Farmers appreciate the De Laval during the busy summer season because of its large capacity and the fact that it is easy to turn and easy to clean.

With a De Laval, the milk is taken care of in the shortest time and with the least effort—both important in hot weather when a number of other things have to be done.

Quick handling of milk and cream in hot weather maintains the highest quality of both, and often means the difference between profit and loss.

Over 2,500,000 De Lavals are in daily use the world over—more than all other makes combined. More than 50,000 local agencies look after the needs of De Laval users.

If you don't know the De Laval agent in your community, write to the nearest De Laval office.

LIVE STOCK NEWS NOTES

Continued from Page 11

tion, and one of the oldest breeders in the state, will consign 15 sows and gilts bred to his two herd boars, Joe's Orion Cherry King 5th and Lord Orion Cherry King. Mr. Thompson states that had he not been reserving the above animals for this sale, they would have been sold long ago, as buyers visit his ranch nearly every day. A number of breeders have already signified their intention of attending the sale to assist the breeders of Tulare County in boosting their favorite breed. The sale will be held in the new sale pavilion. Col. George Bell will be the auctioneer.

Central Milk Producers Financing

The Milk Producers of Central California are floating an issue of $180,000 first mortgage, 7 per cent serial gold notes dated July 1, 1919. This is the second of a series of bond issues by the association. The above association is a unit of the Associated Dairymen of California and has plants at Oakland, Stockton and Modesto. The association plans to extend its operations.

Will Show Durocs

W. M. Way & Son, who, for a number of years, have been breeding Duroc-Jerseys on their ranch near Modesto, are developing several young boars, which they expect to show at Sacramento together with older animals. Mr. Way states that these boars will have to show against animals several months older, but he expects them to give a good account.

Believes in Better Hogs

Walter C. Ficklin of Fresno has two ranches, one in the foothills just east of the city and the other a few miles north. On the east ranch the hogs raised will be for pork purposes only, while on the northern ranch will be located the breeding herd of big-type Poland-Chinas. Ficklin will have four to six head in the August sale of the Fresno County Poland-China Breeder's Association. He was recently elected secretary and treasurer of this organization and is one of the most enthusiastic boosters for better hogs in the community and believes that California ranchers can not afford to raise any but the best hogs.

Buckland and Son to Show Polands

A. Buckland & Son will have in the Fresno County Poland-China breeders' sale August 20, 15 sows or gilts bred to their two herd sires, California Jumbo Buster by Buster Buster and Missouri Blue Valley King by King Big Bone. These two boars will be seen in all the fall shows as the Bucklands believe in showing the public the kind of hogs they raise.

Buys Carload of Eastern Polands

Chas. Gatewood of Fresno has just returned from the East where he went to purchase a car of Poland-Chinas, part of which will be sold in his mid-winter sale. Included in the lot purchased is a young boar by Long Prospect, the sire of the grand champion sow at the Nebraska state fair that also defeated the sow that was made grand champion at the National Swine Show. The boar was purchased from O. E. Wade. Rising City, Nebraska.

Gatewood's Poland Boar, Fresno Boy

Fred Gatewood, the Poland-China breeder of Fresno, has in his young boar, Fresno Boy by Orange Boy, a boar which he believes is going to be of much benefit to the breed in California. He has 22 fall gilts that will be bred to this boar and sold in the mid-winter sale he and his father, Charles Gatewood, will hold in January or February. Gatewood is a direct or of the recently formed Fresno County Breeders' Association and is also superintendent of swine of the Fresno fair. He states the Poland-China futurity to be held at Fresno closed with 15 entries and the Duroc-Jersey futurity with 17 entries.

Grapewild Berkshires

Charles Maurer, in charge of live stock at Grapewild Farm, the Escalon property of A. B. Humphrey, will be at the shows this year with full herds of Berkshires and Guernseys. Maurer has two fall boars by Majestic King 6th; grand champion of 1917 and out of Island Artful Belle 6th, which he considers the best prospects bred on Grapewild Farm in many a day. They are both being reserved for the present, notwithstanding flattering offers for either or both. A new dairy barn, 80 by 124 feet, sufficient for 120 cows, with bull pens, calf pens and stalls for test cows is now under construction. Five cows are now on yearly

Finlay to Handle Anderson Berkshires

Jack Finlay, formerly herdsman of the swine department at the University Farm and who for the past two years has been located in Arizona, has recently returned to the Sacramento Valley and is in charge of the Frank B. Anderson herd of Berkshires, just north of Sacramento. Finlay is regarded as one of the most expert swine herdsmen in the West and it is expected that he will make a record in the Anderson herd. Before going to the university farm he was connected with the Jack London Ranch at Glen Ellen.

Severe Visiting Poland Breeders

A. D. Severe of Dows, Iowa, one of the most successful Poland-China breeders in the Middle West and who has been responsible for many of the leading boars of recent years, is visiting California breeders. Severe is now using The Yank, a son of The Yankee, and therefore a half brother to The Yankee Jr., the good young boar now being used by John Bernstein of Hanford. In the Haag & Bernstein sale to be held at Hanford, September 17, a number of sows and gilts bred to The Yankee Jr., will be sold.

California Cattle on K. C. Market

California cattle still continue to arrive on the Kansas City market in trainload shipments. Lewis & Creel, extensive ranchers at Calipatria, made a sale of 525 head of horned steers. The price ranged from $12.50 to $13.00. "That was our first sale on the Kansas City market," said T. J. Lewis, senior member of the firm, who accompanied the shipment. "The increased shipments of cattle and sheep from our state to Kansas City can be explained in the fact that we are raising more stock producing a greater amount of feed each year. The Coast territory no longer can consume the sheep and cattle raised in territory tributary to those points."

Glide Gets an Imported Bull

Thornton S. Glide, Davis, owner of the Hillcrest herd of Shorthorns, one of the pioneer collections of this state, was a buyer at the great Carpenter and Ross sale at Chicago. Mr. Glide secured the imported red junior yearling bull, Scottish Lord. This bull was bred by Robert Anderson, Aberdeenshire, Scotland, and was sired by Lord of the Ring, a Duthie-bred bull. His dam, Bright Bess of Collynie, also bred by Duthie, was purchased by the Dibble estate, Santa Barbara.

Dibble Estate Buys Imported Shorthorns.

T. Wilson Dibble, San Francisco, reports that John Troup, manager of the Dibble estate's herd of Shorthorns, attended the record-breaking Carpenter and Ross sale held at Chicago June 24 and 25, and selected an imported bull and two imported females. The bull is a roan junior yearling, Grand Gallant. He was bred by G. E. Kerr, Dollar, Scotland. His sire is Sanquhar Grand Gallant and his dam is Imp. Rosamond, a Red Lady, sired by Prime Favorite. Grand Gallant is brother to a bull sold last year for $12,000. One of the cows selected by Troup, Imp. Bright Bess of Collynie, a Marr Bessie, sired by the Duthie-bred bull, Knight of Collynie, is the dam of the bull purchased in the same sale by Thornton S. Glide of Davis. She sold with a red bull calf at foot sired by Maxwalton Minstrel.

The Dibble herd will be out in strength at all of the fall shows.

73 Shorthorns Average $2180

In a sale of Shorthorns held by Bellows Bros. at Marysville, Missouri, June 19 73 head sold for an average of $2180. The first 40 head to sell averaged $2940.

The top bull, Standard Supreme, was purchased by Charles R. Barr of Illinois for $15,600. The top female was Roan Princess, which was purchased by E. Ogden & Son of Missouri for $7000.

New Holstein Record

In the first annual guaranty sale held by Minnesota Holstein breeders at Moorhead, Minnesota, June 12, 76 head were sold for $219,675, an average of $2890, which exceeds the former record for the breed by $460.

The bull, Sir Pieterje Ormsby Mercedes 41st, was purchased by Gaston Pabst of Wisconsin and E. C. Schroeder of Minnesota for $65,000.

New Duroc Breeders

T. J. Gist & Sons of the Holberk Stock Farm, Tulare, recently purchased two fine registered Duroc-Jersey sows from H. E. Cornwell and five gilts from J. P. Daggs. They now have ten registered females that they are going to use for a breeding herd.

Holsteins on Test

T. J. Gist & Sons recently made two very good records on their Holsteins. The cow Astrologess Bonnie Maid has to her credit 22.60 pounds of butter in seven days and Moorland Contenta Jetze made 20.15 pounds of butter in seven days as a three year old.

Why Keep the Other Eight Head?

If calves at 12 months from good grade cows bring $50 each the returns from 12 cows would be $600.

Four registered Shorthorns cows would produce calves worth $150 each at the same age or $600 for the four.

The cost of keep would be three times as much with the grades.

Why then keep the eight extra grade cows? The answer is don't do it.

Put in a few registered Shorthorn females. Their calves will pay the bill.

Second Public Sale

45 SCOTCH SHORTHORNS 45

Thursday, July 10, 1919

State Fair Grounds
Sacramento, California

Hallwood Villager 495521

There are 42 females in this splendid offering, conceded to be the outstanding sale offering of the west to date. A list of all the good ones is a list of the catalog, but in this limited space the following may be mentioned:

BROADHOOKS SULTAN 2ND, a show heifer, by Augusta Baron and out of a daughter of Whitehall Sultan—selling with heifer calf at foot.

LADY GRACE, by the great Ringmaster and out of a daughter of March Knight—selling with an extra good bull calf at foot by Count Glory and she is bred to Hallwood Villager.

LANCASTER SNOWBALL, by Lancaster Rosedale and out of Alexandrina Lady—selling with heifer calf at foot and bred back to Hallwood Villager.

STAMP'S VICTORIA 2ND, by Majestic Viscount and out of Ravenswood Victoria—selling with bull calf at foot by Golden Viscount.

RED QUEEN 4TH, by Viscount's Stamp and out of a daughter of Butterfly Viceroy—selling with bull calf at foot by Lavender Stamp 2nd.

BRED HEIFERS

LADY RUBERTA, a show heifer, by Ruberta's Goods and out of a daughter of Diamond Rex—bred to Count Glory, three times grand champion bull at California State Fair.

RAVENSWOOD LADY 3D, by Majestic Viscount and out of Lady Ardmore—bred to Lord Julian

MAYFIELD VICTORIA 2ND, by Count Glory and out of a Victoria dam—bred to Hallwood Villager.

MAYFIELD HURST 2ND, by Hallwood Sultan and out of a daughter of Wallhurst Goods—bred to Hallwood Villager.

RED MORNING GLORY, by Proud Monarch and out of a granddaughter of Choice Goods—bred to Village Chieftain.

AVONDALE'S GIPSY, by Avondale's Heir and out of Gipsy Queen—bred to Village Chieftain.

The above is a fair sample of the quality of the offering throughout, which includes twelve cows with calves at foot, a large number of bred heifers, and a smaller number of open heifers of the choicest breeding.

THE BULLS

HALLWOOD VILLAGER, a bull that would be an attraction in any sale ring of the highest class Shorthorns, will be a star attraction in this sale. He is rated by many disinterested authorities as one of the very greatest young Shorthorn bulls in the west, qualified in every way to head the best herd of females in the west, and he is conceded to be worth a small fortune to the breeder fortunate enough to secure him. He is sired by Village Flash, one of the best sons of Villager, and is out of a Lavender dam sired by Star's Champion, son of Star of the North.

MAJESTIC VISCOUNT 2ND, a splendid red bull, smooth and mellow, a meaty individual, and with the breeding and type that stamp him as a high class herd bull. He is by Wood Dale Stamp, whose sire was The Choice of All, and whose dam was Imp. Clara 58th. His dam is Fancy of Ravenswood 3d, by Golden Goods and out of a daughter of Lavender Viscount.

VICTOR LAD, a smooth, thick, red yearling by Maxwalton Rosedale, he by Avondale out of Imp. Rosewood Pride. His dam is Victoria, of the famous Cruickshank Victoria family.

This brief outline of some of the animals in the sale gives only a glimpse at the real quality represented, for the individuals and their pedigrees must be seen to be fully appreciated.

Every animal sold as a single lot is tuberculin tested and guaranteed to be a breeder; every young animal permanently immunized against blackleg by Purity Blackleg Aggressin made by the Kansas process.

Sale Opens Promptly at 1 P.M.

Jersey Club's Annual Meeting

The fifty-first annual meeting of the American Jersey Cattle Club was held in New York on June 4.

A year of progress was reported in every department. The registration and transfer of pure-bred Jerseys has been extremely heavy during the past year and indicates the rapid advancement of interest in Jerseys. The Register of Merit now includes some 12,000 cows with yearly records, which is almost as many year's tests as those of all other breeds combined. Three new records were made in the past year and the coveted thousand pounds of fat mark was passed twice.

Provision was made at the annual meeting for an extension of the progressive policies in force to keep up the rapid advancement of interest in pure-bred Jersey stock. The club has increased its appropriations for fair premiums and Register of Merit prizes, as well as having created a fund for calf-club work.

An appropriation was made to take care of the expense involved by the proposed economy test that is to take place in Texas, beginning October 15, at the Texas State Fair grounds. This test is the outcome of a challenge by Mr Ed C. Lasater, the owner of Falfurrias Jersey Ranch, Texas, with its 5000 Jerseys, to the Holstein breeders of Texas to hold a year's test of the two breeds for determining which can produce all dairy products most economically. It will be remembered that the Jerseys won the three previous great tests for economic production at St. Louis, Chicago and Ohio, and the feeling at the club meeting was that a test of this kind in Texas would be one of the best methods of promoting the breed in the South.

The reelection of Mr. M. D. Munn of St. Paul, Minnesota, as president was unanimous, and Mr. E. A. Darling of Vermont was made vice-president. Mr. Geo. T. Chaffee remains as treasurer and Mr. R. M. Gow as secretary. The new directors are Mr. Wm. Ross Proctor, New York; Mr. E. A. Darling, Vermont; Mr. A. F. Platter, Texas; and Mr. Hugh G. Van Pelt, Iowa

$39,000,000 Live Stock Turnover

F. P. Allen of the bureau of markets, Los Angeles, has issued a series of tables showing the actual live stock turnover in Southern California during the year from July 1, 1918, to June 30, 1919, inclusive.

The number of head received and slaughtered at the several Los Angeles plants and the average price per head appear in the following table:

	Cattle	Calves	Hogs	Sheep & Lambs
July to December 1, 1918	79,232	18,048	81,678	121,903
January, 1919	14,566	2,488	19,921	26,904
February, 1919	10,550	2,142	19,794	21,454
March, 1919	10,131	2,474	15,777	23,255
April, 1919	10,477	3,142	15,300	26,208
May, 1919	13,305	3,218	15,441	30,992
June, 1919	12,308	2,469	14,205	27,158
Total kill	150,569	33,981	182,116	277,874
Estimated price average per head	$100.00	$12.00	$35.00	$10.00

Taking the estimated value per head, as above, the total value of the kill follows:

Total Estimated Value of Kill	
Cattle	$15,056,900
Calves	417,772
Hogs	6,374,060
Sheep and lambs	2,778,740
Total Kill	$24,627,472

The estimated value of other stock, including dairy cattle, feeders and shipments to Eastern markets during the year are:

Total Estimated Value Other Stock	
Dairy	$ 3,000,000
Feeders	8,078,434
Shipments to Eastern markets	3,500,000
Total	$14,578,434

The estimated total value of the turnover for the year is $39,205,906.

Turning Feed Into Money

In our Central California news notes we recently referred to the Tulare center hog auction, wherein it is stated: "The feature of the sale was the close of the boy's pig club contest inaugurated by the bureau. The prize pig cost its boy owner $31 and was sold for $55, net profit of $24!"

A subscriber wrote in wishing to know the method of feeding. We asked County Farm Adviser Connor for information, and he turned our letter over to the prize winner, Harry Martin, who writes:

"My pig was a Duroc-Jersey gilt and weighed 97 pounds at the start of the contest. I bought her of my father, paying him 15 cents per pound, or $14.55. I fed her ground milo, ground Indian corn, rolled barley, Suremilk and buttermilk. I fed the grain in a self feeder and gave her all the buttermilk she wanted to drink. I cannot furnish an itemized account of this because it is in the pig club book and the farm adviser has it. The total cost of the feed and buttermilk was $16.41 and the oost of the pig was $14.55, making a total of $30.96.

"I had her pen under a big oak tree and gave her the best of care. I oiled her a number of times and brushed her often. I am sure from the way my pig looked on the day of the contest that I was well repaid for the extra care I gave her. I am now feeding another Duroc-Jersey female pig as an experiment. She now weighs 65 pounds and is ten weeks old. She is from the same strain as the contest pig, and at the rate she is going now she will be the equal of if not better than the contest pig."

A VISIT TO THE BLACKHAWK SHORTHORNS

By W. S. Guilford

In company with Hon. E. H. Grubb, I had the pleasure of seeing the Shorthorn cattle recently purchased in the East by William Ward and E. Lovell of the Blackhawk Ranch Diablo.

Taken as a whole they constitute one of the best collections brought to this state in recent years.

For a herd bull they have secured Roan Radium, a son of Radium, who is by Double Dale. He is a proven sire and his calves are some of the best I have seen. Two outstanding ones are Blackhawk Radium, a rich red youngster, out of a Red Lady dam, and the white Blackhawk Favorite. Roan Radium calves are thick, deep and mellow and have particularly pleasing rear construction, being very square and carrying their width down into their quarters..

Some of the best and most popular Scotch families are represented among the females—Cruickshank Violet Buds and Victorias. There are a number of choice daughters and granddaughters of Villager; a daughter of Gainford Champion, and a granddaughter of Whitehall Sultan. Individuality as well as pedigree was insisted upon and they are an especially useful lot—big and roomy, with

plenty of substance and ample evidence of being good milkers.

Blackhawk Ranch consists of several thousand acres of good rolling grazing and farming land at the foot of Mt. Diablo, in Contra Costa County, 20 miles from Oakland.

This place is already famous for the stud of Shire horses. With the natural conditions, feed, climate and water, and under the management of Easton and Ward and Manager Lovell, this is destined to be one of California's greatest Shorthorn establishments.

HORSES DESERVE PROTECTION FROM FLIES

STABLE flies are a source of keen annoyance to work animals during the heat of summer. Every owner who has the welfare of the dumb beasts at heart should strive to alleviate as far as possible the discomforts to which the horses are exposed.

The most logical method of abating the fly nuisance is to eliminate all breeding place, such as manure piles. The bureau of entomology advises that manure be kept in fly-tight pits or bins until such time as it can be hauled to the fields. Pits should be conveniently located so the manure can be easily thrown in at the time of cleaning and so constructed that it can be readily removed. It is essential that flies be prevented from reaching the manure, but, as some of them will, even though great care is exercised, it is advisable to place a flytrap on the pit.

The coal-tar sprays used in combating the fly evil in the dairy stable are also efficient in driving the winged pests away from the horses. Among the best of these is a solution of 100 parts of fish oil, 50 parts of oil of tar, and one part of crude carbolic acid. It may be prepared at home at a cost of about 35 cents a gallon. This spray, as well as kerosene emulsion and other fly repellants containing coal-tar products, fish oil, resin, and oil of tar, are best applied with an inexpensive spray pump. It is preferable to give the horses a hasty spraying early each morning before they go to work. This brings best results from the use of the fly eradicator.

Sponge Baths After Work.

For the general comfort of the work animals when they come from the field at night it is recommended that after the harness has been removed each animal be given a sponge bath with a solution of cool, salt water. In case there are any work galls or shoulder sores, these injuries should be treated with white lotion, which is one of the best healing and soothing preparations of its kind for use in warm weather. White lotion is composed of a mixture of six drams of zinc sulphate (white vitrol), one ounce of lead acetate (sugar of lead), and one pint of water. It is efficient in curing wounds, sores, summer galls, and fistula, and should be applied three times daily for best results.

The prevalent sentiment among horsemen is that it is better to house and feed the work horse during the summer than to attempt to run the animal on grass with a scant supply of grain and hay. Grass is not a desirable material to serve as the basis of the work horse ration. The practice of turning work animals out on Sundays to eat grass, to which they are unaccustomed, is a prolific source of colic and other digestive disorders. Generally the animals would be better off in a cool, darkened stable, where they could be carried on half rations of grain during idleness.

Night Grazing Harmful.

Where work horses which are fed a full allowance of grain are turned out to graze each night they usually are in poor condition for work next day, as the extra feed they have consumed merely tends to increase the tax on their digestive capacity. However, where the stables are hot and ill ventilated it is preferable to expose the horses to digestive troubles on the pastures rather than to attempt to carry them in the barns.

The feet of the work animals should be examined frequently during the summer, in order that accumulations of dirt may be removed. A few moments devoted to scraping out the hoofs each morning and evening will add to the comfort of the beasts, as often such foreign materials as nails or stones lodge in the wall or sole of the foot or are collected in the clefts of the frog or between the bars and the frog. If the hoofs are excessively dry or brittle, they should be softened with some good oil or hoof ointment, and if they are ragged or tend to split, they should be rasped on the edges and trimmed until smooth.

It is advisable to clip horses when the weather warms up in the spring and heavy work begins. When clipped, they work much better, and they do not become chilled after work from having thoroughly soaked the heavy coat of winter hair with perspiration. Horses that are clipped as soon as heavy spring work begins should be blanketed at night.

HOG CHOLERA LOSSES ON DECLINE

Since 1913, when the United States department of agriculture began work to control hog cholera, the dreaded disease has become less and less destructive each year. A force averaging 165 federal veterinarians has been maintained, working in cooperation with state authorities in charge of quarantine and other regulatory measures necessary for the success of control work. During the fiscal year 1918 more than 5,500,000 hogs were inoculated with anti hog cholera serum, and more than 2200 farms, found to be infected with cholera, were cleaned and disinfected under supervision of the department veterinarians.

Altogether representatives of the department visited more than 15,000 farms to investigate reported outbreaks, to apply preventive measures, and to clean and disinfect premises. How great a menace hog cholera has been to the nation's swine industry may be judged from the accepted estimate that 90 per cent of hogs lost from all ailments die from cholera. In 1918 the death rate of swine from disease was placed at 42.1 per thousand. Thus the loss was slightly above four per cent for the United States, the lowest on record, according to the department's figures.

The Honcut-Yuha and the Cordue irrigation districts in Yuba County have filed petitions for increased water supply.

Attend This Splendid Sale

60 Bred Duroc-Jersey Sows and Gilts 60

This is the largest and most important offering of Duroc-Jersey Swine at Public Sale ever held in California—

Wednesday July 16, 1919

New Sale Pavilion, Tulare, California

Every sow and gilt in the sale bred to a high-class boar.

Every animal guaranteed and bred for early fall litter.

This is your opportunity.

Investing in pure-bred DUROC-JERSEY hogs is practical and safe and returns large profits on the initial cost. DUROC-JERSEYS grow big and grow quick. The sows lead all breeds in the world in the number of pigs farrowed.

To the Breeder—The Farmer—The Beginner

You will find in this sale sows and gilts qualified to go into any herd—you will find them ready to go on any farm and make money for their owner. You will find here animals of real foundation qualities for the establishing of new herds.

Of the Greatest Importance

is the quality of animals offered so this special feature has been adopted.

SPECIAL FEATURE:

The Duroc-Jersey breeders of Tulare County in order to establish and maintain the highest standard of excellence in their offerings have adopted rules and regulations for conducting their sales.

A committee has visited the herds of the various breeders and selected only such animals as were deemed worthy a place in this sale.

The sale animals have been selected from the herds of the following well known and established breeders: Allen Thompson, Tulare; Alex Whaley, Tulare; W. J. Higdon, Tulare; Henry Cummins, Goshen; J. P. Walker, Visalia; Joe Chenowth, Visalia; W. J. Fulgham & Sons, Visalia; W. J. Stewart, Visalia; S. A. Williamson, Visalia; R. E. Clifford, Strathmore; C. E. Ellis, Tulare; R. C. Sturgeon, Tulare.

These breeders are putting into this sale some of their very best sows and regardless of the bid will be sold to the highest bidder. No by bidding or reserve bids. The animal is yours if your bid is the highest.

The Greatest Blood the breed contains will be in this sale

The Critics, The Crimson Wonders, The Defenders, Golden Models, Orion Cherry King—Famous wherever Duroc-Jerseys are known. Don't let this—your opportunity—pass. Remember every sow or gilt is bred to a good, high-class boar.

Secure your copy of the sale catalog at once by writing R. C. Sturgeon, Secretary, Tulare, California, that you may judge the quality of this, California's greatest sale of Duroc-Jerseys. Then make a careful note of the day and date.

WEDNESDAY, JULY 16, 1919

and arrange to come to Tulare County, California's greatest Duroc-Jersey county where these great **Durocs will be sold.**

Free lunch and cold drinks at noon. Sale will start promptly at 10:00 A. M.

Geo. W. Bell, Auctioneer **Allen Thompson, Pres.**

Come and bring your friends and neighbors

Figures That Tell the Truth

By Jean A. Koethen

HOW many poultry people, outside a very few of the largest commercial producers, know what it costs to produce a dozen eggs? How many know how many eggs a hen can reasonably be expected to lay in a year, how many in the month of March, how many in December? How many know the average price they ought to receive for their eggs in order to break even or a little better, what it costs to feed a hen for a month, how much feed she will consume in that time, how much more it costs to produce a dozen eggs in October than in April?

These are the sort of questions producers and manufacturers in every other line of business feel obliged to answer before they put a price on the article they produce. It is only agriculturists in general and poultry farmers in particular who are satisfied to put what comes in into one pocket and what goes out into another and trust to luck for the proper balance, but they are not quite as well satisfied as they used to be.

To say that there has been an awakening among agricultural producers the past two or three years is stating the case very mildly. The producer of food has suddenly come to realize his immense importance in the world and is demanding that the world pay him, as it pays other producers, a comfortable living. Too long has an unthinking public paid what it pleased for eggs, and an unmethodical poultryman accepted less than his produce cost. Perhaps if he had known exactly what a dozen eggs did cost he would not have been quite so willing to sell at a loss. At any rate, he did not know, and it was only when he was forced to study cost of production or go under that he began to face the simple, basic facts which underlie business success.

It was because I had asked these questions a good many times without receiving an answer that I was delighted to see on the wall of the Poultry Producers' office in Los Angeles a statistical chart "analyzing and comparing known factors and assumed grand average factors" relating to the commercial egg industry in Southern California. Such figures as those on this chart are necessarily only averages. The personal factor does not enter into them. But they have the great advantage of being worked out from observations made, not on a single flock, but on several hundred thousand hens, and while they will not fit every flock exactly, they will fit it approximately. Figures are dry things at the best, and they never tell quite the whole truth, but they do give a solid foundation on which to build, and dry as they are, I believe we may study them with great profit.

Cost of a Dozen Eggs

What does it cost to produce a dozen eggs? Not as much in April as in November, we should all answer offhand. Not because a hen eats less in April, but because three hens are laying in April for one that lays in November, and they must all be fed alike whether they lay or not. The cost of a dozen eggs is a factor that shifts from year to year and from month to month.

The figures on this chart, which was prepared by F. D. Cornell, cover the year from January, 1915, to December, 1918. In January, 1915, it cost 36 cents to produce a dozen eggs; in December of the same year it cost 79.4 cents. In 1916 cost of production was a little less the first three months than in January, February and March of 1915, but during the fall it ran higher, reaching a climax at 96 cents in November. In 1917 feed prices took a sudden jump and the cost of a dozen eggs ranged from 40 cents in January down to 22 cents in March and then steadily up to $1.04 in November. A comparison of the cost of production for the different months of 1918 with the prices eggs were bringing in the Los Angeles market will be of interest:

Cost of Dozen Eggs and Price Received

	Cost	Sale Price
January	46.4	54
February	36.2	42.5
March	27	38.58
April	24.78	38
May	26.4	38.14
June	32.4	38.9
July	33.36	45.55
August	42.5	50.91
September	55 94	57.9
October	85.56	68.52
November	101.04	74.48
December	57.12	71.88

Fortunately the market value of eggs was considerably higher in 1918 than in any previous year, and this year for the first time the producer made a net gain instead of a net loss. In 1915 the average market price of eggs was 28.97 cents; in 1916, 31.20 cents; in 1917, 35 cents, and in 1918 it ran up to the previously unheard-of average of 51.61 cents. If cost of production was high, the average market value was so much better that producers were immensely encouraged. Nevertheless, unheard-of as that average was, it was not quite high enough to produce the ten cents a dozen profit which seems reasonable under the circumstances.

Ten cents a dozen profit on the eggs he produces would mean an average profit of about 20 per cent to the producer, which is little enough compared with the profits received in mercantile pursuits. Now last year in order to make this ten cents a dozen, the price should have averaged 53.74 cents, instead of the actual average of 51.61 cents. In 1917 the average of the Los Angeles market was 35.06 cents, while the necessary average to produce ten cents profit was 46.3 cents. In 1915 and 1916 the difference between what the poultryman should have received and what he did receive was about the same. This year it may be that organization and a strong demand will bring the price up to where it belongs.

(Continued next week.

POULTRYMAN'S CALENDAR—JULY, THE FIRST CULLING MONTH

While the color test for high production cannot be applied till later, many poor producers can be culled out in July.

Cull out the hens that are already molting and those that have ceased production without any visible reason.

Cull out the yearlings that have made a poor trapnest record.

Cull out the backward pullets and send them to market with the cockerels.

Cull out all sickly looking hens and those that sit in a corner, those that go early to roost and are out late in the morning.

Cull out the older hens unless you are sure they were profitable last year and have some reason for expecting continued profit.

Cull out all the male birds but those you must keep. They will be only boarders for six months.

Get rid of everything that is of doubtful value, for feed is money.

POULTRY PRODUCERS OF CENTRAL CALIFORNIA CHOOSE NEW MANAGER

The poultry producers of Central California announce the appointment of Charles E. House as sales manager for the association. It is stated that the growth of the business both in amount and in detail has made this assistance to the management necessary, and that Mr. House has a thorough knowledge of the egg business based on wide experience with some of the best firms in the business.

Puckeriness isn't tea-taste; it's tannin-taste. Tannin is what they tan leather with.

You don't want that? Then pay enough per pound for your tea to get the real tea-flavor—⅓ cent per cup.

Schilling Tea is the fine practical economical tea of this country.

There are four flavors of Schilling Tea—Japan, Ceylon - India, Oolong, English Breakfast. All one quality. In parchmyn-lined moisture-proof packages. At grocers everywhere.

DOWN TO HIS JOB

When Robinson Crusoe was wrecked all alone,
On an island far out in the sea,
He didn't sit down on the sands with a groan
And murmur, "Poor, unlucky me!"
He started to work right away with a will,
And builded the first bungalow;
And he fashioned some tools and so managed to till
Some ground that a garden might grow.

Whatever he needed he made for himself
From things that were lying at hand—
Umbrellas or shoes or a head bumping shelf
For the winter preserves he had canned.
Some people, thus stranded, would lie down and sob,
And presently perish, no doubt.
'Twas the way Mr. Crusoe got down to his job
That made him worth writing about.
—New York Times.

SINGING HELPS THE WORK ALONG

OF course, the poets and writers of light opera are all wrong when they try to make out that farming is a business wherein the jovial harvesters join hands with the merry villagers and dance around a Maypole singing roundelays. They are taking too literally Shakespeare's observation that "All the world's a stage." There is something about routing out the cows in the morning before sunup, and something about piloting a plow through heavy soil and salty sweat, that does not conduce to song.

But there are farm songs, and farming songs. The country heard a lot of them last fall when volunteers went out from the cities to help meet the situation created by heavy yields and few harvesters. Most of that singing was done on the way to and from the fields, hut it was pretty good singing, anyway. And there are songs heard mostly at farm bureau meetings and the like. All that is necessary to prove that farmers can sing when they want to is to hear a dozen or a hundred of them join in this, using the tune of "Old Black Joe":

Gone are the days when my farm returned no pay,
Gone are the folks who used to call me "Jay",
Gone are my debts for the better crops I grow,
I hear my neighbors voices calling, "Farm Bureau."

Then listen to this deep-throated chorus:

I'm coming, I'm coming, for my hank is full of dough,
I hear my neighhors' voices calling, "Farm Bureau."

Youth, however, is the springtime of life, and springtime is the season when the human family, and the birds and the locusts and the organ grinders, seem most disposed to make a more or less harmonious noise. Therefore, it is among the farm youth in the springtime of life that you will find the most singing of and at their daily tasks. The boys' and girls' cluhs, organized under the direction of the United States department of agriculturc and the state agricultural colleges, have more songs than you can shake a stick at. And how they can sing 'em!

Here Come the Club Members.

Imagine that you are sitting in the shade of an old apple tree in the green fields of Virginia or Maryland, my Maryland, or some place like that. Down the road comes a bunch of garden cluh boys and girls, with spades and rakes on their shoulders and the light of achievement in their eyes. They are singing, and the strains are the same as in that "Over There" song that went from Broadway to Chateau-Thierry and hack again. Listen:

Johnnie, get your hoe, get your hoe, get your hoe;
Mary, dig your row, dig your row, dig your row.
Down to business, girls and boys,
Learn to know the gardener's joys.
Uncle Sam's in need—pull the weed, plant a seed,
While the sunheams lurk, do not shirk, get to work.
All the lads must spade the ground;
All the girls must hustle 'round!

All together in the chorus:

Over there, over there;
Send a word, send a word, over there,
That the lads are hoeing, the girls are sowing,
The crops are growing everywhere.
Each a garden must prepare;
Do your hit, so that all of us can share
With the boys, with the hoys
Who will not come hack 'till its over, over there!

Their fresh young voices—ah, if all vegetahles were as fresh—die away in the distance. But from over the hill another group of hoys approaches. You know they are pig cluh boys, for to the tune of "Row, Row, Row Your Boat" they are singing—

Grow, grow, grow a pig
Fatter every day.
Merrily, merrily, cheerily, cheerily;
Half our work is play.

And here come some rosy-cheeked girls, all dressed up in white aprons and snowy caps, and everything—they catch what the boys are singing, and they reply:

Can, can, all you can;
Can and put it away.
Merrily, merrily, cheerily, cheerily;
Half our work is play.

Close hehind then are some sewing club girls and now they are singing:

Sew, sew, sew a seam;
Sew the time away.
Merrily, merrily, cheerily, cheerily;
Half our work is play.

And over in that field, can those children be the Little Bo-Peeps and Little Boy Blues of to-day?

They're Real Children.

No; nothing Mother Goose-like ahout them; nothing but the sheep—and their song:

Little Bo-Peep,
Come raise some sheep;
And you do it, too,
Little Boy Blue.

So it goes, with you in the shade of the old apple tree, listening to the club hoys and the cluh girls as they tell in song the merits of their respective avocations. And then, just like in a show, they all troop hack again, and, like the grand chorus, in an opera, to a tune you recognize, this arises:

There were cluh hoys on the hillside,
There were cluh boys on the plain,
And the country found them ready
At the call for meat and grain.
Let none forget their service
As the cluh hoys pass along,
For, although the war is over,
They are singing still this song.

The chorus comes like a cataract:

Keep the home cow milking,
And the cluh corn silking;
Tell the idle hoys and girls
To work for Home.
There's a cluh pig growing,
While the grain we're sowing—
Boost the cluh work night and day
Till we "Live at Home."

WHAT TO DO WITH GRAPES

The preserving of grapes will not he a prohlem for some time yet, hut time flies, you know, so save these recipes for use when the grapes are ready, for they won't wait any better than other fruits. They demand attention in their own good time, not yours.

Grape Jelly

The grapes should not he too ripe; they ought to look only half colored. Pick off the stems and put them in a porcelain lined kettle, harely cover with water, and let them simmer until until they are tender and falling to pieces. Strain through a colander and then put the juice through a flannel hag which has heen wrung out in hot watcr;. press them only lightly. Measure this juice, and to each pint allow one pound of sugar. Put the juice on the fire in a clean kettle and boil 20 minutes, skimming occasionally; meanwhile have the sugar heating in the oven. When the time is up, throw in the sugar and stir until this is dissolved; then let it boil up for 20 minutes and it will be done. If the grapes are fully ripe and sugary, it need boil up only once, and it will jelly on the cup as you dip it out. If you wish to have the jelly extra clear and beautiful, you can have ready a flannel bag and strain it through that directly into the glasses.

Grape Juice

Select fine grapes, not over ripe, stem them and put them into a kettle with water just covcring the bottom to prevent burning. Bring them slowly to the boiling point, stirring

VAILE-KIMES WATER SUPPLY SYSTEMS

When you buy a water supply system, don't buy a cheap assembled makeshift. A V&K Water Supply System will pay for itself in a short time. A cheap system is a constant expense, a constant bother and disappointment and, in the end, is much more expensive than a V&K would be.

MAKE YOUR HOME MODERN

You should have a first class water supply system. It will make your home modern. It will make it a fine place for you and your family to live. It will save you hours of time and will add years to your life, and the lives of your wife and children. Health and happiness come with it.

Write now for the V&K book that tells all about water supply systems. It will help you in choosing one for your home and your work.

Sign and mail the coupon.

$35 to $165

2 and 4-wheeled AUTO WRECKERS
1450 Central Ave, Los Angeles

occasionally. As soon as they begin to bubble, take them off, put them into a cheesecloth bag and hang this up overnight with a clean kettle below to catch the juice. In the morning squeeze the bag a very little with the hands and strain the juice through a flannel bag. Sweeten to taste, put on the fire and slowly bring the juice to a boil, skimming frequently. As soon as it is perfectly clear, put it into sterilized bottles with clean, long corks and seal with wax.

Spiced Grapes

(Especially nice with meats.) Press the grapes from their skins and put the grapes through a colander to remove the seeds; then mix the pulps and skins and measure, taking five pounds of fruit and four of sugar, with a tablespoon of powdered cinnamon, a teaspoon of powdered cloves and a pint of vinegar. Boil slowly for three hours, put in sterilized glasses and cover with paraffin.

Grape Conserve

Prepare five pounds of grapes as before, taking off the skins, removing the stones and mixing pulp and skins together. Then add an equal amount of sugar and the pulp of five oranges and two pounds of seeded raisins. Mix all thoroughly.

FIG RECIPES

The most complete treatment of the preparation of figs we have seen is in a little book of 80 pages issued by the J. C. Forkner Fig Gardens. Figs fresh, figs dried, figs canned, preserved or prepared in any other way are treated in this booklet. We believe it will be sent to readers without cost if the Cultivator is mentioned.

ON HER BEAM ENDS

When the war put its tremendous demand on American shipping there were a great many freighters in service on the Great Lakes that were well suited to carry supplies across the Atlantic. Some of them, however, seemed to be permanently cut off from salt water because they were too long to pass through the locks of the Welland Canal. But American ingenuity was equal to the test. Working under the direction of F. A. Eustis, the engineers of the shipping board cut the vessels in two and floated them, one-half at a time through the locks of the waterway.

The huge freighter, Charles R. Van Hise, presented an even more difficult problem, for she was not only much too long to pass through the locks but also six feet too wide. But again the engineers did not fail. They resolved to turn the two halves of the Van Hise on their sides; it would be a tight squeeze, for the clearance would be only eight inches. Their method of rolling the nine-thousand-ton vessel on her side was as simple as it was effective. According to the Scientific American, they built a series of big tanks on what was intended to become the under side of each half of the ship and pumped them full of water. The calculations were well made, and the capacity of the tanks proved sufficient to capsize the sections, which rolled gently over on their sides just five hours after the pumps were started. After the passage, the sections were rolled back by attaching similar tanks to appropriate points along the exposed keel. —Youth's Companion.

SAVE MUCH FOOD IN CLUBS

Clubs for colored girls have been organized in all Southern states by the department of agriculture and the state colleges. In these clubs there were 50,995 girls last year. The colored club members have the same four year course which is given the white girls, and are taught gardening, canning, preserving, poultry work, sewing, breadmaking, cooking, and the making of special products. In the 15 Southern states the colored girls in 1918 put up from their own garden plots canned products worth $70,933.80 and dried 49,134 pounds of vegetables and 424,168 pounds of fruit, valued at $94,941.40. Besides the products grown by themselves they conserved $46,100.45 worth of fruit and fruit products. The value of all the food products they conserved in 1918 was $241,401.85.

TWENTY YEARS AGO

Nobody swatted a fly.
Nobody had appendicitis.
Nobody wore white shoes.
Everybody spit on the blacking.
Cream was five cents a pint.
Cantaloupes were muskmelons.
Milkshake was a favorite drink.
Advertisers did not tell the truth.
You never heard of a "tin Lizzie."
Doctors wanted to see your tongue.
The hired girl drew one fifty a week.
Farmers drove to town for their mail.
Nobody "listened in" on a telephone.
Everybody didn't tip nobody.
Folks said pneumatic tires were a joke.
A solemn agreement did not become a scrap of paper.
Mother spent part of the morning cleaning the lamp chimneys.
Nobody ate dinner in Newfoundland and breakfast next morning in Ireland.
Nobody cared for the price of gasoline.
The butcher "threw in" a chunk of liver.
Strawstacks were burned instead of baled.
Jules Verne was the only convert to the submarine.
You stuck tubes in your ears to hear a phonograph and it cost a dime.
You could drop a nickel in the slot and see a movie "as through a picket fence—darkly."
Some in the back country occasionally snuffed the candle.
We sang "Captain Jinks of the Horse Marines" and "Will You Love Me, Mollie Darling?"
Them wuz the days.

Mud stains that will not vanish with a usual washing should be washed in cold water then soaked for five minutes in oxalic acid solution. This is the solution we keep on hand for removing fruit stains from our hands. Get the crystals from the druggist and add the water yourself. Guard it carefully.

The curtains that are old or thin should be folded carefully before putting to soak, and kept folded throughout the washing and starching. Also, instead of stretching, fold, exactly in the middle, over a sheet on the line and carefully pull the scallops into place.

Pastry flour has a higher percentage of starch than common flour. If you have not the pastry flour and your recipe calls for it, one-third constarch and two-thirds ordinary flour will make it all right.

Genuine kindheartedness and helpfulness needs no self advertising.

Tractor Use, Profit, and Safety

TRUE progress is always slow. The change to mechanical power for farm work has been twelve years in the making, but today there are few American farmers who have not given serious thought to the question of tractorizing their farms.

For the benefit of those who may not yet be convinced that the tractor is a useful, profitable farm power machine, we present again a few of the opinions of farmers who are using the International Kerosene Tractor. Some of these are about essential features, and some mention only conveniences, but taking them altogether, almost any farmer will feel, after reading them, that the International 8-16 is a tractor worth considering.

"My International supplies a power flexible enough to handle the large amount of seedbed, harvest and other work without delay."

"It can be used for continuous work if emergency demands it."

"It produces power at much lower cost than horses, and it can be used for both drawbar and belt work."

"I like the steady way it works. Without seeming to hurry, it gets through a surprising amount of hard work."

"It does a lot of good work at a cost so low I could hardly believe it. You did a wonderful thing for Eastern farmers when you made this tractor to run on kerosene."

"It is not bothered by flies, nor by bumble bees. It works steadily on the hottest days."

"Requires very little care. When the day's work is done, I run the tractor tail first into an inexpensive shed. In the morning, I fill the fuel tank and the oiler, look into the radiator, and am ready for another day's work."

These opinions are typical. They prove at least that the International 8-16 is a useful, profitable tractor. Now consider just one other thought for a minute.

This tractor is the outgrowth of twelve years of active tractor experience by a company that has sold all kinds of farm machines for many years. The beginning of this business goes back to 1831—almost 88 years ago. Does it not seem reasonable that with this experience we should offer you a tractor that you could use with profit, especially when we expect to come back some day and sell you more of the machines listed in this advertisement?

If you are now convinced that the International 8-16 is a useful, profitable tractor on some farms, and that you don't have to be an expert to buy one safely, write us to find out what this tractor will do for you, on your farm. A post card will bring you full information.

Heider

11 Years Actual Field Work

For eleven years America's leading power farmers have used the Heider in every kind of tractor work. Heider principles have been tested by time and found to be absolutely correct.

No Gears to Strip

With the Heider Drive the power is taken directly from the flywheel by two large metal discs at either side—one to go ahead, the other for reverse. No jerking, no vibration, no gears to strip. Tractor always in "mesh." Seven speeds forward and reverse, all with one motor speed and one lever for traction or belt.

MODEL D 9-16
With Rock Island No. 9 Power Lift Plow Attached. One-Man Outfit.

15 to 20% Fewer Parts

The fewer the parts through which the power has to travel, the more power delivered at drawbar or belt. Heider Tractor's simple construction does away with 15 to 20 per cent of parts. It does away with clutch, transmission gears and bevel gears. This leaves the maximum power for pulling plows and harrows, for hauling loads, for every farm job—with less fuel and less upkeep expense.

Two sizes, 12-20 and 9-16. Send for catalog of Heider Tractors and Rock Island Tractor Tools; the famous Rock Island Tractor Plows, 2, 3, or 4 C T X bottoms, and the Rock Island one-man Tractor Disc.

ROCK ISLAND NO. 38
One-Man Tractor Disc Harrow. Operated from Tractor Cab.

E. P. Bosbyshell Co.
125 N. Los Angeles St., Los Angeles, Cal.
Manufactured by
Rock Island Plow Co., Rock Island, Ill.

Model C
12-20 H. P.

Tractor *and* Truck

For the Price of One

The Wheat Tractor

The WHEAT TRACTOR handles three 14-inch plow bottoms under all normal conditions. It will furnish power for any hay baler or silo filler, also plenty of power for a medium sized grain separator, with weigher, wind stacker and self feeder. As it is equipped with a governor like a stationary engine, the WHEAT TRACTOR will furnish steady power for pumping water, running an ensilage cutter or doing any similar farm work.

With the WHEAT TRACTOR'S interchangeable road wheel attachment it can be converted in less than an hour into a road truck with rubber tired wheels and will do anything that a 3500 pound truck will do with trailers.

Write for descriptive printed matter. Some good territory still open for dealers.

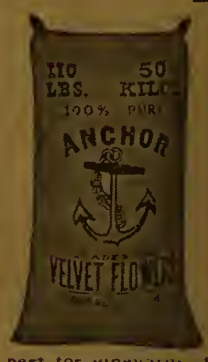
Supplies liberal. Old — demand and movement slow, market steady, little change in prices. Quality and condition wide range. Sales to jobbers: California,

Sulphur



It has been proven and so recommended by the University of California that if you sulphur your grape vines and orchards SIX times they will not be affected by MILDEW or RED SPIDERS.

ANCHOR Brand Velvet Flowers of sulphur, also EAGLE Brand, Fleur de Soufre, packed in double sacks, are the fluffiest and PUREST sulphurs that money can buy; the best for vineyards, the best for bleaching purposes, LEAVING NO ASH.

VENTILATED Sublimed Sulphur—Impalpable Powder, 100 per cent pure, in double sacks, for Dry Dusting and making Paste—(Atomic Sulphur).

For LIME-SULPHUR SOLUTION, use our DIAMOND "S" BRAND REFINED FLOUR SULPHUR. We can furnish you this sulphur at such a low price that it would pay you to mix your own solution and net you a profit equal to the amount paid out for labor in spraying your orchard, even if you pay your men $4 per day for making the solution and applying same.

To create additional available plant food, drill into the soil 100 to 400 pounds per acre DIAMOND "S" BRAND POWDERED SULPHUR 100 per cent pure. This has increased various crops up to 500 per cent.

Also PREPARED DRY DUSTING MATERIALS, Tobacco Dust, Dry Bordeaux, Dusting Sulphur Mixtures, etc.

And "Anchor" Brand Standard LIME-SULPHUR SOLUTION 33 DEGREES BE., Sulphur Paste, Nicotine, Blackleaf 40, etc, Fungicides and Insecticides.

Carried in stock and mixed to order.

San Francisco Sulphur Co.

624 California St. San Francisco, Calif.

We are equipped to make immediate shipments. Send for "ILLUSTRATED BOOKLET," also booklet "NEW USES FOR SULPHUR", Price-list, and Samples.

Please state for what purpose you use the sulphur, quantity needed, and date of shipment preferred. Telephone Kearny 871.

HAY

We quote today wholesale prices in carload lots for old hay as appear from dealers' transfers upon the hay market—for prices to consumers charges of cartage, commission and handling expenses must be added according to conditions:

Fancy Wheat hay (light 5 wire bales)	17.50@18.00
No. 1 Wheat or Wheat and Oat hay	15.00@17.00
No. 2 Wheat or Wheat and Oat hay	12.00@14.00
Choice Tame Oat hay	15.00@17.00
Other Tame Oat hay	12.00@14.00
Wild Oat hay	10.00@12.00
Barley hay	11.00@13.00
Alfalfa hay	14.00@16.00
Stock Hay	9.00@11.00
No. 1 Barley straw, bale	50@80

Citrus Markets

Los Angeles, July 2, 1919.

Large supplies of cantaloupes in the Eastern market combined with each day's increasing receipts of fresh deciduous fruits have slowed up the market for Valencias to the extent that several packing houses have closed and will hold back shipments from California till the Eastern market picks up. It is expected that the Fourth of July demand for oranges will take care of the supply on hand in the East and clear the way for new shipments. Reports of June drop throughout the state indicate a rather light crop of Navels next season.

The lemon market also is slow.

Shipments

Shipments of citrus fruits to date since November 1, 1918: Southern California: oranges 26,519 cars, lemons 7282, total 83,801. To same date last season: oranges 11,655, lemons 4003, total 15,658. Central California this season: oranges 4415, lemons 354, total 4769. Last season to same date; oranges 2535, lemons 115, total 2650. Northern California; oranges 244, lemons 2; last year same date, oranges 203.

QUESTIONS AND ANSWERS

Continued from Page 9

and I have just made an examination this morning and find that the fungus Fusarium is abundant on the specimen. In general appearance it looks like the same trouble that is known to occur on watermelons, known as watermelon wilt. If this be the case there is nothing, so far as I know, to be done to save the vines. The fungus lives over in the soil from the previous crop and the disease usually gets worse and worse if the same crop is continuously planted upon it. So far as I know the only prevention is the practice of crop rotation and melons of any kind should not be planted upon it until the fungus is largely diminished. In the southeastern part of the United States they have found that it takes at least four years and sometimes more to get rid of the fungus in the soil. Whether or not it will take this long in California, I do not know. I shall make a further examination of this specimen and if I find anything different, will report to you later. I am not absolutely sure from this one specimen that the trouble is all due to the same thing as the watermelon wilt, although it looks as if this might be the case.

HONEY PRICES NAMED

The California Honey Producers' Cooperative Exchange has named a price of 11 cents a pound on new crop light amber extracted alfalfa honey at wholesale. The new price is 4½ cents a pound under the 1918 quotation. About 75 per cent of the state's bees are said to be owned by members of the Exchange.

Held by a Grip of Steel!

Where is the weakest point in every ladder—it's the point where each step is fastened to the stile but that's where the

SECURITY KANT-WOBBLE LADDER

is strongest! Each step-end is held to stile by a light steel cuff-bracket which forever eliminates all wobble, and makes the SECURITY strongest where other ladders are WEAKEST!

See your dealer's name in Cultivator of May 31, page 749. If your town is not listed there we will ship to you freight prepaid on approval two or more ladders at following prices: 8-ft., $5.00; 10-ft., $6.00; 12-ft., $7.20.

Pay after you examine and approve shipment.

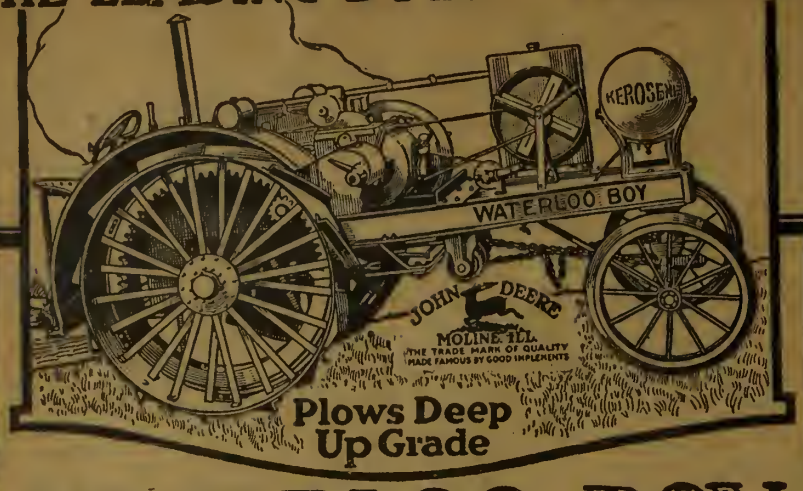
THE LEADING 3 PLOW TRACTOR



Plows Deep Up Grade

WATERLOO BOY
ORIGINAL KEROSENE TRACTOR

"In old timothy sod I pulled three 14-inch bottoms at an average depth of six inches, some of the time up a pretty steep grade. In stubble I pulled the same plows at an average depth of eight inches."—Geo. W. Lee, Gladstone, N.J.

Waterloo Boy reserve power insures a smooth, even job of plowing in rolling land or varying soil conditions. Its two-speed motor, 2¼ and 3 miles per hour, enables you to turn the furrow at varying speed for best results in any kind of soil; quick change of speed and 12-foot turning radius permits close work in irregular fields and at corners.

The Tractor That Pays Its Way

because it is the right size for the widest range of profitable operation—supplies ample power for the heavy work, economical power for the lighter work—available for all work. Many Waterloo Boy owners are keeping their tractors busy most of the year—at draw bar or belt.

Simplified construction makes it easy to operate; equipped with Hyatt roller bearings, dependable ignition device, patented fuel saving kerosene burner, automatic lubricating system and other features which insure many years' service at minimum up-keep cost.

Our illustrated catalog, sent free on request, gives full information with many views showing Waterloo Boy efficiency on farms. Write for it

Western Canada's "Horn of Plenty" Offers You Health & Wealth

Western Canada for years has helped to feed the world—the same responsibility of production still rests upon her. While high prices for Grain, Cattle and Sheep are sure to remain, price of land is much below its value.

Land capable of yielding 20 to 45 bushels of wheat to the acre can be had on easy terms at from $15 to $30 per acre—good grazing land at much less.

Many farms paid for from a single year's crop. Raising cattle, sheep and hogs brings equal success. The Government encourages farming and stock raising. Railway and Land Co's. offer unusual inducements to Home Seekers. Farms may be stocked by loans at moderate interest. Western Canada offers low taxation, good markets and shipping; free schools, churches and healthful climate.

For particulars as to reduced railway rates, location of land, illustrated literature, etc., apply to Supt. of Immig., Ottawa, Can., or

OUR ADVERTISERS RELIABLE

We guarantee our subscribers against loss through dishonesty of any advertisers in the Cultivator. We do not attempt, however, to adjust trifling differences between subscribers and honest, responsible advertisers, nor will we pay the debts of honest bankrupts. Notice of complaint must be sent us within 30 days from date of the transaction, and the subscriber must have mentioned the Cultivator when writing the advertiser.

THIS WEEK'S COVER

Apricot drying is ending and soon peaches will be covering the trays in many sections of northern California. California has 124,000 acres in peaches and dries over 30,000 tons; its canneries have an output of over 5,000,000 cases. The value of the peach industry of the state was in 1918 over $16,000,000, and from present indications that valuation will be more than doubled this year. Great is the California peach.

This view was taken in Tulare County which advertises itself as the equal in area of the state of Maine.

ROADS IN CITIES

With all of our campaigns for better roads in California there is one feature which has not been worked out as it should be, and that is the condition of the roads within the city limits. Occasionally at the limits of the cities the sign is erected "This is ..... Speed limit 20 miles per hour." There is no occasion for this announcement, for the condition of the road proclaims the city and limits the speed. Instantly we begin bumping the bumps and our heads hit the top of the auto. This type of street construction may not be followed all the way through the city, but compared to the roads outside the limits they are often most indifferent in quality.

This condition is not referred to to bring discredit to any town, for the same thing is true in nearly all cities in the state. City and town streets are not equal to those outside. We know of several cases where the incorporation of towns has been delayed and where sections have been annexed to cities at a date later than desired simply to secure completion of state highway building.

It is certainly unfortunate that our towns and cities are so indifferent to the necessity of good roads. Farmers may well insist that merchants who wish their trade see to it that the outside good roads system is connected up with their business district by better street improvements.

"GOING BY THE BARN"

In "doing" the state recently for the purpose of giving a fund of information to an Easterner who is "selling" California, we were asked a most pertinent question by a little miss who has driven through the farming section of Illinois and was for the first time getting a look at California. Remark was made as to the thriving appearance, or otherwise, of certain ranch and orchard homes, and the little lady inquired: "Do you go by the barn in California?" We were somewhat at loss as to the meaning of "going by the barn", and the mother explained that the expression is common in the Middle West where the barn is considered a better indication of the wealth of the farmer than is his house.

While it is probable that in California we do not "go by the barn" so much as other sections, for California climate does not call for Eastern equipment, at the same time the farm buildings, or, more, the surroundings of the farm buildings, are a wonderfully accurate indication of the real thrift of our producers. Too often the cast-off implements, instead of being thrown into the junk pile, or still better, disposed of as junk, are allowed to rot or bleach and litter up the ground which should be of some use. Values in California, taxes in California, implements in California, all are too high priced to justify the neglect indicated by the surroundings of farm buildings. Many a separator or drill or even tractor has been given additional years of life by protection from the weather. The good old days of leaving the combined harvester where the last job ended are past, but there is room for improvement. If this statement is questioned we would suggest a drive up and down the state, either coast or valley, sizing up the farms. It's fairly safe to "go by the barn."

SUN-MAID CITY

A Sun-Maid guide recently took us in hand and gave us a view of one of the buildings of Sun-Maid City, a couple of miles from the business center of Fresno. It certainly is some city. It is worthy of a visit from every raisin grower in California. It is most convincing of the magnitude of the industry and of the business methods which prevail and which are making such a magnificent success of California raisin vineyards. There is no more striking illustration of the value of cooperation than in Sun-Maid City.

We have no information as to the thousands of square feet of floor space, of the height of the buildings or the cost of the structures, but we carried away a vivid picture of great reinforced concrete buildings, perfectly lighted, with every possible mechanical contrivance which makes for efficiency, operated by an organization so efficient that every movement seems to fit into the action of a perfect machine.

We may refer to just one or two items of efficiency in this process of packing raisins. As they are delivered at the door from the car which has brought them from the vineyard they are dumped from the sweatboxes into automatic conveyors which take them to the seeders; from the seeders other conveyors take them to the benches where women pack them in cartons. They are weighed with exactness, placed in boxes, checked, weighed and inspected, cover nailed on, branded, loaded in car, with hardly a stop in the entire process, and merely a few minutes is required in passing through from one side of the great city to the other.

Features in the city are the rest rooms, recreation rooms, hospital or clinic with constant attendance of physicians and nurses. Even the slightest injuries are given free treatment. At the time of our inspection a lady from one of the packing benches was having bandaged a wrist overstrained by constant use in passing cartons.

Sun-Maid City is truly named, for California's sunshine and California's vineyards stored the sugar which makes possible the industry of 150,000 acres in raisin grapes which will this year produce well up towards 200,000 tons of a value at which we are only guessing, but, say, 25 or 30 millions of dollars.

AUTO GRAPHS

Los Angeles to Sacramento in an auto is a lot more fun and one learns more a-lookin' than he can from a car window.

* * *

A car window these busy days, likewise warm days, takes the trip from one end of Caclifornia to the other, especially on the "Valley Line', by night.

* * *

The busy man entrains at San Francisco or Sacramento in the evening and arrives at Los Angeles —or vice versa—early next morning. does business all day, home next night, having slept through the longest state in the Union and learned nothing — nearly nothing — of busy apricot orchards, self binders, mowers, combineds, fields irrigated and made ready for milo, almonds, grapes, peaches, all fruits, a-growing —producers feeding the world. It's more informing to "do" this state up one side and down the other in an auto. Let gas do it.

* * *

Just a word before speaking of the interesting things seen from the auto. This word has to do with the business side of the California Cultivator.

* * *

Besides the home office which gives employment to nearly a score of busy folks, there is a branch in San Francisco under the direction of M. C. Holman, another in Sacramento where R. P. Royce, live stock editor, grinds out his copy of interest to the live stock people. In this he is assisted by C. L. Hughes. Another branch is located at Chicago, in the Steger Building. This is in charge of Tom D. Costello and a corps of nearly a dozen efficient workers. Mr. Costello occupies his time in "selling" California as represented by the California Cultivator to advisers of the Middle West. The Eastern portion of the United States is covered by S. E. Leith with headquarters in the city of New York. This is mentioned merely to give an idea to the Cultivator's increasing family of the real magnitude of the organization necessary to produce the paper, to give the news and cultural information required for the nearly 40,000 papers which are printed every week.

* * *

Now, as I said, Mr. Costello has been talking and has been "selling" California from the Chicago or Middle West office. He has done this most successfully for a number of years and is now in California learning more of this state and its resources that he may carry back to Chicago information as to the opportunity which Eastern dealers and manufacturers are missing who are not offering their wares to California buyers. Mr. Costello has already decided: "This is some state. I am astounded at the number of things you produce here, at your perfect climate, your wonderful roads, but, more than all, the awful bigness of things. This sure is some state with its thousand miles of good roads stretching in almost a continuous line from one corner at the Colorado River and Mexican boundary to the northern line at Shasta.

One gets this sense of bigness more by auto than by train, hence "Auto Graphs."

* * *

A gray morning, streets of Los Angeles left behind, San Fernando Valley, sunshine breaking through the fog, past the world's greatest olive grove, reservoirs holding the waters of Mt. Whitney 250 miles away, the "riffles" where the waters are purified by air and sunshine before being turned into the distributing system of a great city, Soledad, Mint and Bouquet Canyons are all past, and old Jeff, or, more respectfully, the Jeffrey automobile with F. H. Thomas, manager of the Cultivator Publishing Company at the wheel, settles down on the $25,000 per mile concrete Ridge Road with a contended m—m—m—as soft as the purr of a kitten and as musical—almost—as the meadow lark. If I could write poetry my first should be "The Song of the Auto." The artistry of the mechanic who tunes the machinery under the hood is worthy a real poet.

* * *

Strange, the mixture of almond orchards and Joshua trees in the Antelope Valley which is really a part of the Mojave Desert. The almonds are not as healthy nor as prosperous looking as they should be, that is, there are many dead trees and open spaces where trees were, but those still alive are filled with nuts. We were in the Antelope because of necessary detour while part of the Ridge Road is paving.

* * *

Those Joshua trees, or yuccas, 15 to 20 feet high, weird and strange, absolutely useless to the human race excepting as odd things to look at until the Yankee learned to put the great rough trunks into the lathe and turn out a veneer from which is made tree protectors for the orchardist and splints for the use of surgeons in the hospitals of all lands.

* * *

Elizabeth Lake, Crane Lake, Ridge Road, Tejon Pass, long sweeping curves making a drop of over 3,000 feet to the head of the straightaway concrete highway into the San Joaquin Valley. Sixty-three miles with scarcely a turn and without a bump.

* * *

It is yet early in the season and still some vineyards and orchards not irrigated are showing the need of water. The year's rains were wonderfully distributed and crops are giving wonderful return, still the fact remains but a small amount of water went to the lower depths of the soil and only most careful conservation will see deep rooting trees safely through the season.

More Graphs next week—C. B. M

Citrus Culture---Irrigation, Cultivation, Fertilization

By Ernest Braunton

FEW questions enter into the irrigation of citrus orchards, but these are important ones; only two in number, when, and how. The when deals with the number of waterings, how far apart, in time, etc.; the how relates to methods. No other questions are of much importance. In dealing with the "when" the nature of the soil must be considered, also the age of the orchard. The first year after planting is the most important one and it is considered good practice to water them once a month until rains come, no matter what the nature of the soil. It is better this first year to give too much rather than too little water. After the first year it is safe to state, for general rules, that every orchard needs three or four irrigations, either number covering the same period of time, approximately 24 weeks.

On light soils give four irrigations six weeks apart and on heavy soils three irrigations eight weeks apart. This is offered where water is plenty, work well done, and the subsequent cultivations thorough and sufficient. Some orchardists' water supply is based on a specific amount available only on a certain day or days each month. If one has no storage reservoir and is compelled to use his water direct from the ditch he must irrigate when he can. This does not compel the best practice and should not be accepted if it can be avoided. Soil and climate are ruling factors in irrigation and all districts cannot follow the advice herein offered. In the hottest parts of interior valleys, in the lightest soils, no orchard could go unwatered for six weeks without serious harm resulting. However, it might be remarked that such lands are not best for citrus crops.

The amount of water necessary should be gauged by soil tests and not by gallons or inches. In ordinary soils a soil-tube test should show that water had reached five feet below the surface. In heavy soils water will sometimes have to run continuously for three days and nights to saturate the soil down five feet. No other than the furrow method will fill the soil, and in such soils several furrows will shorten the time, and this is just as true in light soils. Never less than four furrows should be used between the rows, and in many cases six would yield better results, for in very porous soils the drop of the water is greater than the lateral percolation, and many furrows must be used or the basin or check basin methods used. Only comparatively level land of a light character should use the back-furrow or ridge system, by which all the land is flooded, for water should not long stand about citrus trees. In rainless autumns it may be necessary to give an extra irrigation, falling well into December, but ordinarily no water would be needed during what we term the winter months.

Cultivation

The basis of orchard cultivation is plowing, and this is generally done but once a year, to turn under the cover crop which all orchards should grow. From that time, throughout the summer, cultivation only follows irrigation, and the practice differs greatly. Cultivation should follow irrigation as closely as possible without packing the soil. It should fall apart or pulverize easily or the work should be left for another day or two. Where the drying process is slow it is well to run over the orchard with a harrow when the surface begins to bake or crust, and a day or a few days later the real cultivation may be given. Some light sandy soils are ready for cultivation 24 hours after the water ceases to run. The minimum of work and the maximum of results are usually obtained on a light friable loam. The cultivator does not have in mind the killing of weeds as is so often the case in stirring the soil, but the soil is to be aerated while seeking the main object—a dust mulch to conserve the soil moisture. To accomplish this, pulverization is necessary and the finer this process goes the better the results obtained in saving water. For this reason all the organic matter is necessary that the owner can get into the soil. Too much cannot be given California soils.

If the upper soil can be deeply and finely pulverized the orchard will need far less water than if otherwise treated. An abundance of humus in the soil not only simplifies and reduces the amount of work, and also of needed water, but it keeps the soil more equable and lower in temperature during summer, a very important factor in the control of the June drop. This soil mulch should be not less than four inches deep, while one of six inches would be much better. It is possible to gain this in a very light sandy soil with a single cultivation after each irrigation, but in some soils it is a problem, and good caretakers frequently cultivate a half-dozen times between irrigations. The less one cultivates after each watering the more often will the water have to be applied. Harrows, disks, spike-tooth and other cultivators are some of the equipment used, and the tractor is rapidly replacing the horse in furnishing the necessary power. We hear far less of plow-sole and packing the soil where the tractors have been longest in use. A few growers have stopped stirring the soil entirely and are using straw mulches instead, but the writer believes the latter practice will be abandoned except in a few cases where unusual and unfavorable conditions prevail. The straw and other mulch material should be composted and, as soon as it partially decays, haul it upon the soil and cultivate it in. This indeed will prove the "happy medium." In cultivation the aim should be to begin lightly and go deeper with each operation. In this way the soil moisture is best conserved.

Fertilization

Fertilization of the soil should begin as soon as the orchard is planted, for it is easier to uphold soil fertility than it is to upbuild it when once depleted. The question of fertilizers is one upon which practical orchardists and soil chemists disagree, and clash as well, each in his own class. So that the question is an open field for discussion and each writer or speaker must be held to account for his own statements. So here goes for "dis chile". To provide plant food is not the only purpose of application of fertilizers. The physical condition of the soil must be improved, and anything that will improve the physical condition of the soil, aside from sand, lime, etc., also contains plant food. It may be better to put it another way. The best way to improve the physical texture of the soil is by the introduction of organic matter, and all organic matter contains plant food. Bear in mind that, in virgin soil at least, physical condition is of more importance than the amount of plant food present, for without proper physical condition plant food is not available to the plants. In California a good supply of humus is of all things the one most needed, and we have soils that for years need no other treatment, for the humus-making material carries a sufficient amount of plant food with it, and sufficiently balanced to need no supplementary elements.

Of all forms of fertilizers known none is so valuable or sufficient as stable manure, and in some soils no additional plant food is necessary to produce heavy crops of high grade oranges over a considerable period of years. How long this succession of good crops will continue is hard to say, but we have orchards where nothing else has been used. These are necessarily small tracts, for a large supply of stable manure is no longer available and some is shipped long distances. (While the writer was a park commissioner of Los Angeles we sold hundreds of tons that were hauled by auto trucks as far away as Redlands.) Stable manure is also most lasting of all fertilizers. After using it for a long term of years and discontinuing its use the resultant and subsequent crops will be better over a longer period of years than is the case with any other material used. One local orchard was very heavily treated with stable manure one year and for eight years thereafter was given none, but each year a cover crop of vetch was grown and turned under. This orchard has continued to improve each year and the owner is eagerly watching to note a depletion of crops not general in his neighborhood.

This treatment may not bring similar results on other kinds of soils, for our friend, R. R. Snowden, cites a case in the Cultivator of November 9, 1918, where stable manure (fresh) had an adverse influence, resulting in poor crops. But stable manure is always good for a general application and the case cited by Mr. Snowden is a most unusual one, for soil conditions as a rule are favorable to the nitrification of organic nitrogen. If not, as he says: "Nitrates must be added." But still use the stable manure. Lacking, as we do, a sufficient supply of this valuable material, it is unquestionable that we should grow and turn under green cover crops. All must do so, for we cannot grow oranges or lemons without a good supply of humus. In young orchards this will keep up the supply, for the trees are small, the crops heavy, and cover nearly the whole area. In old orchards, where the trees nearly touch each other, the crops will be insufficient, but even there we should grow all that the meager supply of light will allow. As every grower will have to study the specific needs of his soil, it is perhaps best that an article intended for the guidance of beginners should not enter more deeply into this truly complex question. All authorities will agree that the advice so far given is of the best. In closing, let it be understood that it is necessary to use some commercial fertilizers in nearly all soils to supplement either stable manure or cover crops or the best possible results will not be obtained.

Saving Labor in Growing Beets

MANY farmers are solving the labor problem by using larger implements and more horses. Such practices have enabled sugar beet growers greatly to reduce their expenses for man labor and increase their operations. The normal man labor required in growing sugar beets will vary from 80 to 135 hours or more an acre.

Under average conditions, where more horses and larger implements are used the man labor on machine operations will be reduced approximately 25 per cent.

A direct comparison of plowing crews in Michigan and Ohio, where conditions under which the work is done are uniform, shows that approximately one hour an acre less of man labor is necessary to operate a plow drawn by three horses than by two. With the larger outfit, as also when a tractor is used, a float or plank can be attached to the plow, and thus the breaking of a cloddy surface can be done with little additional effort or cost. In disking it was found that a four-horse outfit saves one-quarter of an hour of man labor an hour over the two-horse equipment.

Saving In Sugar Beets

Cultivation of sugar beets furnishes a striking contrast in crew efficiency. In Michigan and Ohio it was found that 1.9 man hours an acre were required to cultivate once over with a one row implement, 1.6 man hours with a two row cultivator, and only .9 of a man hour for a four row cultivator—a distinct saving in man labor by using the four row machine. As many fields require attention before it is possible for the grower to get the work accomplished, any saving of labor and time is an advantage to the growing crop and affords more man labor for crops competing with the sugar beet in the distribution of labor.

Under average conditions a crew of one man and two horses working continuously will lift approximately one and one-half acres of beets a day. A crew of one man and four horses will probably increase this area to two acres, or possible two and one-half acres a day under favorable conditions. The performance of the lifting implement can be improved still further with the addition of more horse power. If, by using an extra horse on the lifter, this work can be performed in a shorter period, more time will be available for hauling the beets to the factory or loading station.

Harvesters Mean Further Economy

An appreciable saving in farm labor will undoubtedly be accomplished through the development of mechanical harvesters. The hand labor on sugar beets, comprising such operations as blocking, thinning, hoeing, pulling, topping and loading, constitutes from 52 to 75 per cent of the total man labor in growing the crop. The pulling, topping and loading, when combined, make up 24 to 42 per cent of the work. Estimates made by several growers show a variation of 24 to 30 hours in the labor requirement for the hand work in harvesting. It is very apparent, says the bulletin, that this amount can be reduced to a few hours an acre with the introduction of the mechanical harvester. This will in turn release man labor for other important work during the fall months.

Agricultural News Notes of the Pacific Coast

Northern California

The grasshopper pest in the Sacramento Valley is under control.

The grasshopper pest is reported under control in Sutter County.

Modoc County reports offers for wool having declined to 45 cents.

Serious grain fires are reported in nearly every section of the state.

Threshing has started in the grain fields of Grass Valley, Nevada County.

Sacramento and Yolo Counties are making shipments of Bartlett pears.

Grasshoppers in Glenn County have been doing damage to growing rice.

Several apricot growers are trying out the plan of drying the fruit whole.

The Livermore Stockmens Association held its annual rodeo July 4, 5, and 6.

The Chico district of Butte County will have a bumper almond crop this season.

Forty carloads of garlic will be shipped from the Alameda district this season.

The Alameda Sugar Company has 5,100 acres of sugar beets growiing in Yolo County.

Carload shipments of garlic will be made from the San Francisco district the middle of the month.

15,000 people attended the picnic of the Fourteen Counties Association at Nelson Grove near Woodland.

It is rumored that the Sperry Company will take over the flour mill at Chico and fit it for handling rice.

A total of $45,000 in cash prizes is offered for exhibits at the state fair. The dates are August 30-September 9.

A poultry raiser of Hyampom, Trinity County, is making a success of shipping chickens by parcels post to San Francisco, 310 miles.

Wild mustard has been declared a pest in the grain fields of Big Valley, Lassen County. Many fields have been spoiled by its spread.

A buttermilk condensing plant is being installed at Benicia. The buttermilk is condensed to about the consitency of butter and sold for poultry feed.

The Glenn Olive farm center of Yuba County held a big rabbit drive on June 29. The drive was under direction of rodent control experts employed by the state.

A survey of the smut situation in the wheat fields of Yuba County is being made by C. V. Wilcox of the cereal disease department of the University of California.

By federal regulation going into effect July 1, no cattle affected by tuberculosis can be shipped from one state to another if the animals are to be used for breeding or dairying purposes.

Owners of combined harvesters, headers, stationary threshing machines or hay presses are required to have fire extinguishers on their machines by the provisions of a new law just signed by Governor Stephens.

Heads of the various agricultural bureaus to be consolidated in the state department of agriculture held their first conference in Sacramento June 20. One matter of interest discussed was the consolidating of agricultural exhibits at the state fair.

Central California

One hundred twenty-five thousand sacks of grain is the estimate from the east side.

Wheat growers of the Porterville district report little market in sight for the big wheat crop.

The Stanislaus County farm bureau has decided to discontinue local meetings through July and August.

Members of the Tulare County Canning Peach Association are happy over contracts for clings at $92.50 per ton.

Petitions are being circulated for the formation of the Merced irrigation district to cover approximately 176,000 acres.

A new peach handling plant is to be built at Hanford by the California Peach Growers' Inc., at a cost of $61,000.

Minimum wage for women in canneries has been placed at $13.50 per week for a working week of six eight-hour days.

The farm adviser of Madera County is compiling a list of pure-bred stock breeders of the county; hogs, cattle, horses, poultry, etc.

At the hog auction held at Tulare June 25 by the California Farm Bureau Marketing Association the top price was $18 for a lot of 68 hogs averaging 215 pounds.

The Kings County farm bureau is considering the proposition made by O. V. Cobb of the Valley Fruit Growers' Association to establish at Hanford a model laborers' camp.

Horticultural Commissioner Rutherford of Stanislaus County says the cantaloupe acreage of the Tuslock section is one-third larger than normal. The shipping season has opened. Great care will be taken to see that no green fruit are shipped.

Porterville canneries have already booked orders for the shipment of 110,000 cases of peaches and apricots as soon as they can be packed. The sales committee of the Tulare County Canning Peach Association has announced the closing of a contract with a California canner on the basis of $92.50 per ton for clings and $55 per ton for frees. The estimated pool of the association this season will amount to about 6000 tons.

The first of the season's barley crop began to arrive in Tulare last week, between two and three weeks earlier than in previous seasons, and with the barley showing cleaner than in most previous years. The same is true of the wheat which has been coming in from the Tulare lake regions in the western edge of the county, where a record-breaking crop has been harvested. The lake just now is entirely dry and the entire wheat bottom has been one vast wheat field this season.

The tomato cannery of the California Italian Products Company at Tulare has been leased to the California Cooperative Canneries, which will use the plant this year up to the time of the tomato season for the manufacture of apricot butter and for canning peaches. The new lessees have purchased the pool of the Tulare County Peach Growers' Association, a total of 80,000 tons, at a price of $92.50 per ton. Of the peaches 3000 tons will be canned at Tulare, the balance going to the cannery of the organization at San Jose.

Southern California

The cantaloupe shipping season in Imperial Valley is coming to a close

The first full carload of grapes for the season was shipped from El Centro June 25.

Walnut growers at Saticoy, Ventura County, report aphis knocked out by the hot weather.

Word is received of the death of Fred W. Knight, for eight years manager of the Tustin Lemon Association.

The California Prune and Apricot Growers Association is campaigning for increased membership and acreage.

The heaviest shipments of cantaloupes are over from Imperial Valley; watermelon shipments continue to increase.

Riverside County's olive crop will this year amount to 800 tons, according to estimates of Horticultural Commissioner Sharp.

Live stock organizations of the Imperial Valley met in El Centro, July 2 to lay plans for a live stock fair to be held in the fall.

Walnut growers of Chino are planning to form an organization to affiliate with the California Walnut Growers' Association.

At a meeting held in Fillmore, June 27, apricot growers of Ventura County decided on a wage scale for this season's apricot drying work.

Many orange packing houses in Southern California closed during the latter part of June to let the Eastern markets catch up with the supply of fruit on hand.

A mass meeting of bean growers of Ventura County was held at Oxnard Saturday afternoon, June 28 The meeting was addressed by Wiley Giffen, president of the California Associated Raisin Growers.

Four carloads of lima beans were sold the last week of June at nine cents. These sales were made by the lima bean pool. It is now believed that the pool will net bean growers about seven cents per pound.

The annual report of the Coachella Valley Date Association shows fresh dates sold from their packing house at Indio for an average price of 37.98 cents per pound. In addition a ton and a half of minced dates were put on the market.

Grain growers will be allowed 4½ cents per bushel for bags this year, instead of 9 cents, the amount fixed by the government last year as the allowance to the shippers for the cost of bags. The reason for cutting down the allowance is a proportionate drop in the cost of bags in the market.

H. H. Warner, director of membership work of the California Walnut Growers Association, and Roswell Cochran of the advertising department, have been looking over crop conditions in Ventura County. Mr. Warner was formerly in charge of the Los Angeles office of the U. S. bureau of crop estimates.

At the annual meeting and picnic of the San Bernardino County farm bureau held at Devore last Saturday the following officers were elected: President, R. B. Peters, Devore; vice president, Harrison Kerrick, Grand Terrace; directors-at-large, for west end, W. W. Coke, Redlands; H. A. Cherrier, desert; George Siemon, Hinkley, San Bernardino section; Mrs. S. U. Stewart, Del Rosa.

The Coast and General

A large shipment of Japanese peanuts was received recently in San Francisco.

Governor Campbell has appointed Earl M. Matteson of Benson state bee inspectoor.

Farmers of Lane County, Ore., who lost their bean crops in the late frosts are considering planting broccoli.

The light automobile truck has become a factor in marketing strawberries in the Hood River section of Oregon.

It is proposed to hold a corn show in connection with the Northern Arizona fair to be held at Prescott in October.

Boys' and girls' agricultural clubs of Spokane County, Washington, are planning a county-wide picnic some time this month.

Arizona has just turned over to the trustees of the various school districts the sum of $449,557.80. This is $6.10 for each child of school age.

Dr. H. H. Blome, formerly head of the Northern Arizona State Normal school, has been appointed new director of vocational education for Arizona.

A bill has been introduced in the house authorizing the appropriation of $20,000 for the establishment of a poultry experiment farm near Glendale, Arizona.

Salt River Valley, Arizona, truck growers have grown this year some yellow tomatoes. Previously it was supposed that the yellow tomato would not mature in this climate.

Wyone Taylor, a 14-year-old girl of Pima, Arizona, is the winner of the state championship for the Girls' Canners Club work. She has put up 250 jars of fruit and vegetables, each one representing a separate product.

A farmer in Yavapai County, Arizona, in cooperation with the United States biological survey and the county agricultural agent, poisoned the prairie dogs on his farm and has produced a crop of beans and corn worth $2500. Previous to poisoning the rodents it was impossible to raise any crop.

Bids for the Tempe Mesa highway have been received by the state engineer of Arizona. The lowest bid runs about $30,000 a mile for a 20-foot concrete road. The Tempe-Phoenix concrete highway is now open to the public, and is without question one of the very best pieces of road in the state of Arizona.

Forage on the Arizona ranges is still in good condition, although there has been no rain since May. Pastures on some of the higher elevations have begun to deteriorate. Throughout most of the range country cattle are in good condition. In part of Santa Cruz and Graham Counties stock and range are reported as only fair.

Cattle men of Cochise, Pima and Santa Cruz Counties, members of the Southwestern Cattle Growers' Association, at a meeting held at Nogales, June 18, protested against the plan of the supervisor of the Coronado national forest to round up all the cattle in the forest for a government count. The cattle men claim that a serious loss would be sustained if a round-up is carried out at this time.

Irrigation and the Alkali Problem

By W. P. Kelley

In delivering the following address some months ago at the San Bernardino Citrus Institute Prof. Kelly expressed the hope that it would not be considered as an attempt to throw a scare into California culturists or to advance pessimistic ideas, but simply the presentation of a few facts as to conditions which might obtain in some sections of California and upon which the grower should be informed in order to protect his land so far as possible from the catastrophe of having alkali carried onto it, especially lands which may have a certain per cent of alkali content. This address caused much comment, and we are glad to pass it on to readers of the Cultivator.

IT IS my purpose to discuss two phases of the alkali problem as related to irrigation. They are: Seepage and irrigation run off; composition of irrigation water. I shall tacitly assume throughout this discussion that the accumulation of alkali is a thing to be avoided wherever possible, that alkali wherever present in any considerable amount is not only undesirable but that an increasing content of alkali is likely to become a serious factor in the production of almost all kinds of crops. While this paper has been prepared with citrus culture especially in mind, much of what I shall say applies to irrigated agriculture in general and to a large number of irrigated crops.

That citrus trees are among the especially sensitive plants to alkali is commonly admitted; investigations published some 20 years ago leave little room to doubt it and experience and investigations more recently abundantly confirm this view. Different varieties of citrus show varying degrees of tolerance to alkali. In general, lemons are considerably more sensitive than oranges and in some instances it appears that Navels are more sensitive than Valencias. In our investigations on soils in Southern California this subject has forced itself upon my attention and has come to be one of the prominent subjects of investigation.

The effects of alkali manifest themselves in various ways, but I shall not attempt to discuss the detailed relationships between citrus culture and alkali. The subject is a large one and presents many angles. As in the case with other crops, it is enmeshed in consierable complexity, and the specific effects produced by alkali on citrus trees when grown under different soil and climate conditions are frequently quite variable.

At present I shall mainly consider the actual accumulation of alkali. I cannot refrain from stating, however, that it is not necessary for alkali to accumulate to a point where excessive concentration in the usual sense has taken place before definitely injurious effects are produced. In our studies on the subject it has been found necessary to study the effects of the different alkalies on the soil itself. The results are throwing a flood of light on the idiosyncrasies of alkali. Already it has been found that unfavorable physical and chemical effects are frequently produced in the soil long before an injurious concentration has accumulated.

Alkali in its literal sense is nothing more nor less than the easily soluble materials that are formed as the result of the decomposition and weathering of rocks and soils. Where the rainfall is sufficient, the penetration of water deep enough and the drainage adequate the soluble materials are leached away periodically and alkali does not accumulate. The water passes out into the country drainage, carrying the soluble materials with it, consequently there is no accumulation of alkali. But the case is very different over a large part of the Southwest. Here little or none of the rainfall actually penetrates sufficiently deep into cultivated soils to leach soluble materials deep enough for them to pass on into the continually moving currents.

During previous eras, or whenever the soil and sub-soil materials were actively laid down, and especially since the time of their deposition, soluble materials have accumulated to a greater or less extent over very large portions of the present agricultural lands of the semi-arid region. Fortunately the main portion of the present citrus area does not contain excessive amounts of alkali at present, nevertheless this problem is sufficiently closely related to every acre of citrus land in California to justify careful consideration at the hands of citrus growers.

The phase of this question that probably first suggests itself to the minds of farmers relates to the translocation of alkali from one area to another through the slow and more or less intermittent process of leaching effected by irrigation water. Large areas of land receiving only light rainfall and which for thousands of years, perhaps, have lain in a semi-arid condition have now been brought under cultivation through the beneficence of irrigation.

Unless special precautions are observed with such land the irrigation run-off finds its way to lower levels and in any event a slow movement of moisture in the sub-soil takes place following irrigations, always towards the lower levels. This moisture dissolves and carries along with it small amounts of the soluble materials with which it comes in contact. In many cases this process goes on so slowly as to escape detection. Unfortunately in many other cases its progress has not been marked with especial slowness. The result of this process is that the lower lands later become more or less water logged, where through evaporation the concentration of alkali gradually increases till the upper portions of the soil become heavily charged with alkali.

Examples illustrating this process are well known and altogether too common in practically every large irrigated section of the West. Indeed it is not necessary to go beyond the limits of the present citrus area to find illustrations of this very process in operation at the present time. Fortunately the area of citrus lands as yet affected by a high water table is not especially large, but after all the tendency for alkali to accumulate in the low places is sufficient in itself to warrant attention. As a matter of fact any piece of land wherever it may be located in an irrigated country under which and onto which either irrigation run-off or seepage water is passing and from which there is not adequate means for this water to pass on and drain away, is in danger of ultimately becoming an alkali bed. The amounts of soluble materials gathered up by slowly moving water as it seeps through soil and sub-soil of the very best quality is sufficiently great, if allowed to evaporate in confined areas long enough, to become a problem in itself.

A phase of this matter commonly overlooked is the fact that the soil, and especially the sub-soil on the mesas, frequently contains small amounts of alkali, although the concentration may not be prohibitive so long as it remains in its original distribution. Nevertheless the mesas frequently contain greater amounts of alkali than much of the soil lying lower down in the valleys. When water is applied to these higher lands the slow downward leaching process begins. Irrigation run-off and seepage slowly find their way down hill, carrying more or less of the soluble materials dissolved on the way. These ultimately accumulate in the lower lands and there may later become a serious alkali problem.

While I do not wish to enter upon an extended discussion of the matter at present I wish to state in passing that practical citrus growers and irrigators in general will do both themselves and posterity a lasting benefit if they pay strict heed to the movement of irrigation water from the higher to the lower levels both on their own and nearby lands. Greater damage has been done in certain sections of the West through neglect in this matter than through almost any single factor with which I am acquainted and an ounce of prevention is worth 1000 pounds of cure.

Over-irrigation, in a word, is one of the greatest evils, because it not only prevents the greatest economic use of water as such, but also carries in its train the strong probability of an alkali problem, either for the farmer himself, his neighbor or for posterity. Even with the very greatest care in the use of water it has not yet always been possible to avoid this slow seepage process.

Good and really effective drainage is an indispensable adjunct to permanent irrigated agriculture and over large tracts of land natural drainage will not accomplish the purpose. In my opinion a broad drainage policy must ultimately be adopted if the continued well-being of the soil is to be maintained. It is not pleasant to contemplate, yet the facts are clear to my mind that the only possible outcome for the insufficient drainage that now exists over large bodies of the present irrigated lands is a baffling alkali problem. A rising water table, or even a stationary water table within a few feet of the surface, stands as a constant threat to the future value of a piece of land. As a matter of public policy it should, in my opinion, be an offense before the law for one man deliberately to conduct his drainage onto his neighbor's land. The only real solution lies in conducting the drainage into a channel that will act as a positive purveyor to the sea either directly or indirectly. Hundreds of thousands of acres in California have already been seriously injured by neglect in this very matter.

(Continued next week)

A One-Armed Gardener

By M. E. Bemis

When we see blind men that make a living in spite of their handicaps and men without legs who outdistance many who are physically 100 per cent efficient, it has a tendency to put some of us to shame. George Artis, a gardener of the Salt River Valley of Arizona, has only one hand, but he doesn't let a little thing like that interfere with his job. Last year he decided to follow the style of many farmers in that section and raise a little cotton. The variety grown is the Egyptian Long Staple which has been developed in Arizona and is known technically as American Egyptian.

Artis has only three acres; part of that is in a fruit orchard and part under lath for growing early vegetables, both spring and fall. So he had only an acre and three fourths for cotton. This he dug up by hand and, mind you, with one hand at that. He planted by hand and cultivated with only a hand hoe wielded by this same right hand. When picking time came he gathered it all with one hand, and his crop amounted to 1,150 pounds of lint, or more than two bales on the one and three-fourths acres, which netted him $610.40.

Single Handed Farming

George Artis. His left hand is not in his pocket. It isn't, but in spite of the handicap he does all the work on his little three acre farm. This shows his lath house where he grows early winter vegetables.

The picture shows Artis standing beside his lath house which, as may be seen serves to shade the young plants from the hot summer sun and permits starting the tender fall vegetables a little earlier than if grown under the direct rays of the intense Arizona sunshine.

Tractor *and* Truck For the Price of One

The Wheat Tractor

The 12-24 WHEAT TRACTOR handles 3 14-inch plow bottoms under all normal conditions. It will furnish power for any hay baler or silo filler, also plenty of power for a medium sized grain separator, with weigher, wind stacker and self feeder. As it is equipped with a governor like a stationary engine, the WHEAT TRACTOR will furnish steady power for pumping water, running an ensilage cutter or doing any similar farm work.

With the WHEAT TRACTOR'S interchangeable road wheel attachment it can be converted in less than an hour into a road truck with rubber tired wheels and will do anything that a 3500 pound truck will do with trailers.

Date Palms in the San Joaquin

A NOTEWORTHY experiment and one whose success will add materially to the fine record already borne by the San Joaquin Valley because of its agricultural and horticultural productiveness, is the culture of the date palm for commercial purposes. This experiment is being fostered by W. R. Nutting of Fresno, a man of progressive ideas and one who has done much toward building up the fruit industry of the San Joaquin Valley. The finding of specimens of Phoenix Dactylifera, the fruit bearing variety of palm, scattered here and there in the valley, planted for the most part solely for ornamental purposes, served as the inspiration for this project.

Five-Year-Old Date

As to producing dates in the San Joaquin Valley this illustration speaks for itself.

Date palm culture has many attractive features; immense yield per acre, small cost of cultivation, freedom from disease, long productive life (from 75 to 100 years), the fact that the date is 50 percent and more sugar and so preserves itself and does not have to be processed in order to be marketable, and further, that it is one of the very few plants that will thrive in soil permeated by alkali.

Mr. Nutting's idea is to establish experimental gardens to be cared for scientifically and, in addition, to plant date palm parks in all the cities of the San Joaquin Valley, or plant in the parks already established, instead of the ornamental palms. Such trees with their clusters of beautiful ripening fruit would be doubly ornamental.

With the exception of a few dates produced in Arizona and Southern California practically all the dates found in our markets are imported from northern Africa and Persian Gulf ports, so that the date industry would have market advantages over other fruits. The present annual consumption of dates in this country has been conservatively estimated at 32,000,000 pounds or about five ounces to the person. The fruit, through experiments on seedlings, has proved valuable as a forage crop, being especially good for fattening porkers. So should the fruit for any reason prove unfit for human consumption or be unmarketable, the owner could utilize it to advantage as a forage crop.

The date palm will grow in most any kind of soil, though a sandy loam seems best suited to it. The transplanting of the seedlings or planting of offshoots in the valley should be made in April and May. The plant blooms in the spring, usually anywhere from March first to the latter part of May. The fruit matures in the fall and early winter. It withstands a great deal of moisture. They "like to have their heads in the sun and their feet in the water." In the valley of the Nile in northern Africa date palms have been known to stand in water for several months when the river has overflowed, and without

Fruiting Date at Selma, San Joaquin Valley

This tree bears edible dates. It is many years old; the date of planting is not known.

apparent injury to the tree. Also it requires but little cultivation. It is subject to injury from frost when young, but it will stand quite a low temperature without serious injury. The fruit does not mature at the same time, but often extending over a period of two or three months. This fact misleads many people into thinking that the fruit does not thoroughly mature.

Speaking of this project Mr. Nutting had this to say: "I do not expect that the culture of dates as I hope to see it established in the San Joaquin Valley can be made a highly paying industry at once. To establish it on a sound basis will require an immense amount of cooperative, preliminary effort, but it can in time be made a most valuable industry in the valley and so of benefit to the entire state."

ARCADIAN
Sulphate of Ammonia

Men who applied ARCADIAN Sulphate of Ammonia to their grain are beginning to reap the profits.

FRUIT TREE LEAF-ROLLER ATTACKS WALNUTS

The state horticultural commission is giving publicity to a note recently received from E. O. Essig at Oxnard. This further bears on the penchant for walnuts of insects closely identified with the apple, notwithstanding the dissimilarity in the two botanical species as regards both leaf content and character of fruit. Mr. Essig writes:

"On June 9, 1919, A. A. Brock, county horticultural commissioner of Ventura County, brought to my office a number of half-grown walnuts showing the work of an insect larva which greatly resembled the work of the larva of the codling moth on the young English walnuts. With these walnuts Mr. Brock brought also two living larvae which were taken feeding upon them.

"At first thought on finding the work it was supposed that the codling moth was the culprit, but upon examination of the larvae this idea was at once abandoned. A microscopic examination, such as was possible without proper facilities, revealed the insect in question to be a leaf-roller and apparently the fruit tree leaf-roller, Archips argyrospila Walker, which has a wide distribution in California.

"The damage, which was considerable, occurred in a walnut orchard near Santa Paula. Inasmuch as this insect has not been previously noted as attacking this particular host and as there is so much interest in the codling moth attacking walnuts, it was thought best by Mr. Brock and myself to send a short note for publication."

AVOCADO PROGRAM FOR 1919-20

There are no more enthusiastic horticulturists in California than the avocado growers. As an instance, Pres. Sallmon of the California Avocado Association is asking directors and members to consider the following proposed program for next year's work and make sugestions for its betterment.

Some of the things to be aimed at: Increase membership to 300. Study marketing problems; Steps to assist members in sale of fruit, steps toward elimination of marketing unfit fruit, study how to pack for shipment, standardize sale prices of varieties. Continue study of varieties. Cooperation of Rockefeller Institute in investigating uses of avocado for medicinal purposes.

Extend the educational campaign; leaflet on "Avocado as Food," leaflet on "How to select a good avocado and prepare for table," prepared articles in press, reprint "The Avocado from Seedtime to Harvest." Directors' Field Day for visits to groves.

Exhibit of fruit at best season.

Encourage keeping of individual tree records.

Steps toward securing qualified man for sub-tropical fruit investigation.

The next semi-annual meeting will be held at Santa Barbara, October 24 and 25.

SCALY BARK AND FUMIGATION

Demonstrations on scaly bark control were staged last Saturday by the Orange County farm bureau at S. S. Twombly's grove in Fullerton. The demonstration was conducted by Prof. Fawcett of the Riverside experiment station. Prof. Fawcett also discussed control methods in the afternoon of the same day at the Tustin schoolhouse. In the evening Prof. Quayle took up discussion of fumigation with liquid gas, also at the Tustin schoolhouse.

GOOD ORANGES DUMPED

From Freeport, Pennsylvania, comes a newspaper story that a carload of good oranges was dumped at a siding, sprayed with oil and covered with dirt so as to make them unsalvageable—all this in order to maintain prices. The dealer to whom they were assigned by the California shipper claims they were condemned by city and government authorities.

TiziT TiziT

Safe From June Drop

Now Make Your Valuable Orange Crop Safe From Black and Citricola Scale

Your valuable orange crop is safe from June Drop now—why not make it safe from Black and Citricola Scale?

The cost is very low for the protection afforded—from 2 cents per tree two years old to 15 cents per tree for the material on trees up to twenty years old.

Black Scale hatches from May to November. Owing to the uneven hatch the best eradicator is a material that is on the tree when the hatch comes out. The scale cannot avoid Tizit Spray if properly put on. Tizit will stay there on the job ready to kill until washed off or rendered ineffective by the fall rains.

And it cleans the trees of dead scale that perchance is often left. Tizit is a Killer of Scale and a Cleaner of Fruit. Trees function properly when Tizit is applied.

It is NOT an oil base spray. There is positively nothing in its contents but that is beneficial to tree and soil. Groves in Los Angeles County sprayed with Tizit every year for the past 5 years are yielding more and better fruit topping the market, and the trees are the best testimonials we have.

TIZIT SPRAY costs less and works longer. It is the best and most economical Black and Citricola scale eradicator you can buy.

Let us send you the names and locations of regular users of Tizit Spray in your section so you can see the results of from one to five years regular use.

Our citriculturist, Mr. Wyllie, is at your disposal.

Agriculture's Opportunity

From Address by Dean H. E. Van Norman to University Farm School Graduating Class

MONEY is a necessity as things are today. No one gets along without it. The city man secures neither food nor clothing, houses nor recreation without money. From automobiles to fresh eggs, street cars to pew rent, it is a money transaction. With the farmer it is only less so in proportion as he produces his own eggs, milk, meat, vegetables, fruit, and as he owns his own transportation system. His income is in irregular and usually scattered amounts.

It is small wonder that the young man who arrives in this world without money, or clothes even, should be eager to complete the period of his dependency on others; that he should weigh the details of his college course in terms of its seeming money-making power; or that he should be impatient to "get a job" and want to get a job that pays, especially if he is ambitious to own a ranch and has no hope of falling heir to the lifetime accumulation of parents or others.

It is small wonder that money looms big at your age—money maybe to pay college debts, money for necessities, money for fun, money to start your own business, money to establish your own home, and yet in spite of its importance and necessity we are told that nearly 90 per cent of all men die dependent on other than themselves for their bread and butter. Thus we admit the vital necessity of money and that you have been giving the major portion of your time and thought here at the University Farm to those things expected to increase your earning power—your money-making ability.

But my parting thought, as you sit with nervous fingers waiting for the parchment that is the symbol of one task done and of your readness for a new one, is the hope that your earning power in money matters is larger than your normal necessities; that each of you may not only make a good living and a reserve for the rainy day, but that you each have a surplus of energy, time, ability and thought to give to your state, your community, your neighbor and your family.

* * *

Have we in agriculture a code of ethics? Or can we evolve one, which, if lived up to, will dignify our life work as a profession rather than merely a money-making business? I sincerely believe that agriculture offers us that opportunity and I venture to suggest as a start for our code of ethics for the profession of agriculture:

First, that the land we cultivate and the flocks we feed shall be more fertile and more productive because they have been ours, aside from any wealth they may have given us.

Second, that we give freely to our neighbor of the fruits of our experience and observation. Agriculture is not a secret to be locked up from our competitors.

Third, that, as the products of agriculture are vital and essential to the life of society, so is the constructive thought and effort of the man or the land necessary to the solution of great problems confronting this nation. And so, the gift of ourselves to the community is as vital as the product of our lands.

Children are under-nourished, ill and dying in our great cities from inability to buy the milk and other foods from our farms. Not because the farmer receives too much for his part in producing them, but because our system of handling and distributing does not fully meet the day's needs. Strikes and social unrest menace the peace of our country because of a similar failure of our system to satisfactorily distribute the wealth of the nation. Somewhere between the radical view of the Bolshevist, who would destroy all and start over, and our present system that permits the accumulation of fabulous fortunes on one hand while the rank and file of the employes strike—yes, fight—for a little more than the bare existence of themselves and families, there is, there must be a happy medium, where the laborer receives an adequate reward for his manual effort without injustice to those whose money and directing brains make possible a successful and combined plan of all.

* * *

The rich lands of our nation tend to go to the ownership of men of wealth and the labor on them to be performed by the itinerant workman and the tenant, each making a mere living, contributing little or nothing to the social betterment of the community, in the life of which he takes little part. If this condition is to be correctly adjusted, you, as citizens, successful each in his own line, each in proportion to his measure of ability, influenced only slightly by the accident of circumstances, must by virture of self-interest and pride in the profession of agriculture, give all your thought and time and strength to these problems in whatever community you find yourselves.

The farm bureau meeting, the good roads, the school, the church, political and social life, all need your participation. It is not enough to vote, to pay taxes or pew rent, but you must think out loud in meeting to the end that the ultimate thought of your community shall be that which is best for all. In no other branch of effort does the so-called private citizen count for so much in our great democracy as does the successful land owning and occupying farmer who rears a family and takes his full share in the active life and discussion of the problems of his community.

This is the opportunity which the profession of agriculture opens to you, the opportunity to be more than a money maker, to be an influential citizen.

IMPORTED HONEY

The imported honey which arrives on the New York market comes from the West Indies and Central America, most of the shipments from the West Indies and from the islands of Cuba, Porto Rico and Jamaica. Shipments from these islands are made in barrels, tierces and cans. Only a few five gallon cans are received, the majority of the imports are in barrels. The cans used in these Central American shipments differ from ours, however, in being for the most part miscellaneous five gallon oil and gasoline cans which have been shipped into the country. These cans are supposed to be thoroughly cleaned before being refilled with honey, but on account of the rather crude methods used in Central America the cleaning process is not always thorough. For this reason, it is at times almost impossible to dispose of honey which has been shipped in these cans. Furthermore, the shippers often make use of the same old crates in which the cans came to them, to ship back the honey. This does not add to the market value of the honey. These cans are undoubtedly pressed into service because of the apparent scarcity and rather high price of barrels in Central America.

GLENN COUNTY FARM BUREAU

All meetings at 8 p. m. unless otherwise stated:

July 14, Codora; July 16, Calay; 18, Plaza Farm Center; 21, Willows Farm Center; 23, Elk Creek, 2 p. m.; 23, Grapevine, 2 p. m.; 25, Larkin Grapeville, 2 p. m.; 26, Directors meeting, 10 a. m. On Saturday, July 14, at 10 a. m. a call meeting will be held at Willows of the Woman's Home Department Committee.

TEHAMA COUNTY FARM BUREAU MEETINGS

Antelope, July 8; Dairyville, 9; Oak Park, 11; Corning, 16; Bend, 18; Richfield, 21; Los Molinos, 28. A directors' meeting will be held Friday, July 25, in the Chamber of Commerce of Red Bluff at 1:15 p. m. sharp. All regular center meetings will be held at 8:30 p. m.

A rice mill and grain elevator are proposed for Live Oak, Sutter County.

Legal Queries

Louis B. Stanton, attorney, 243 Wilcox Building, Los Angeles, will answer legal queries in this department.

Immediate mail replies cannot be given except where fee to Mr. Stanton is paid. When replies are wished in Cultivator address query to 115½ N. Broadway, Los Angeles.

Mortgage Outlawing

In the case of a mortgage which is outlawed by running four years after maturity, will payment of interest automatically renew? If not, is the note outlawed or is it collectable providing the mortgagor has personal or other property, or does the note outlaw as well as the mortgage? Is there any recourse whereby the mortgagee may secure relief?—Subscriber, Riverside.

The lien of the mortgage follows the note; when the statute of limitations has run upon the note, it also runs upon the mortgage. Payment of interest on loan does not in this state renew an outlawed obligation, but it requires a promise in writing to pay the obligation by the debtor. The statute of limitations is a shield rather than a sword; the fact that it bas run upon an instrument which constitutes a lien on real property does not thereby remove the lien upon the property. If the mortgagee is in possession of the property or can obtain peaceable possession, the owner thereof cannot put him out, nor would the owner of the property, who is the debtor upon the mortgage be successful in any attempt to maintain an action on its title, which the note constitutes. The fact that a note is outlawed does not mean that it is non-collectable. In case suit is brought thereon it would be for the party claiming the bar of the statute to allege that bar. An outlawed note is a good consideration for a new obligation.

Contract Can Be Enforced

I entered into an agreement with the owner of a ranch to manage it one year for $50 per month and 20 per cent of the profits. After six months the owner sold the ranch; the new owner refuses to recognize the old agreement but has made payments of $50 per month to me. Can I collect the baiance on my contract from the man with whom I made it or from the present owner?—Subscriber, Pond.

You certainly have an action for your 20 per cent of the profits against the man with whom you made the agreement. If the present owner has not recognized that agreement you cannot hold him thereto. His mere payment of $50 per month is entirely consistent with a new employment.

Right to Remove Fence

I purchased a parcel of land two years ago, over one corner of which a wire fence was placed. There are no line fences around the land or on adjoining land. This fence was placed by a concern which owned all of the land at this point, for the purpose of inclosing the pasture. Have I the right to take up a section of the fence crossing my land, use it in another place, or sell it, or am I required to move it along the line and put it up to keep pasture, leaving my land free?—Subscriber, Chula Vista.

Unless there was some right retained by the original owner to use a part of this land as pasture, which is in no wise stated in the question, you are entirely within your rights in taking up the section of the fence and using or selling it as you would any other property which you purchased. You are not required to inclose your land if you do not wish to do so, and you are not required to protect another man's pasturage.

Community Property—Joint Tenancy

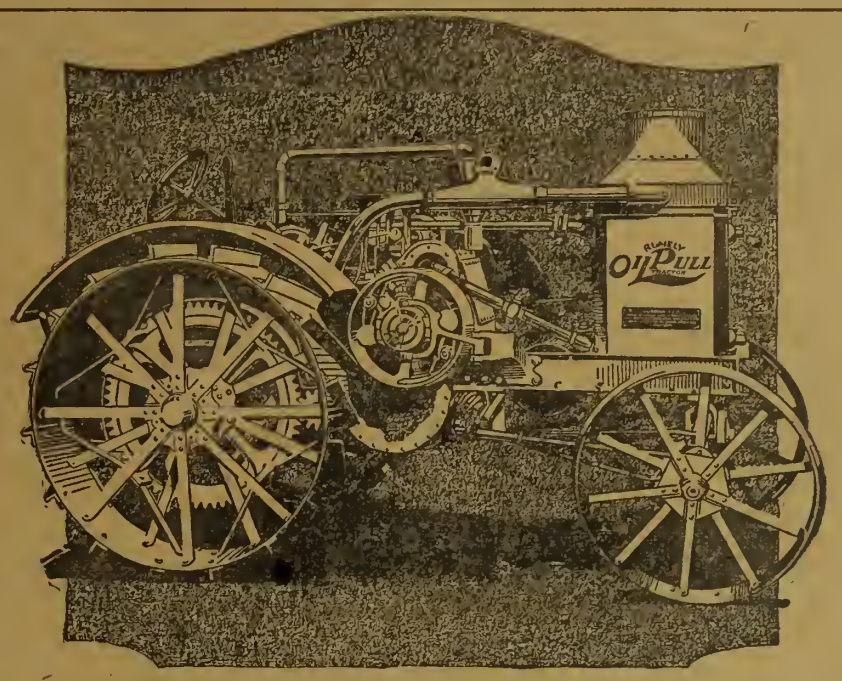
What is the difference between community property and joint tenancy? What is the difference in the administration and expenses relative to these properties? Can community property be changed to joint property? Or would it be advisable to do so while all property now stands in the wife's name?—Subscriber, Ontario.

Property held in joint tenancy may or may not be community property; it has reference to the legal title under which the property is held. In order to place property in joint tenancy it is necessary that it be deeded to the joint tenants by a third party under tenure to be held to the joint tenants or to the survivor. Under the recent act of the legislature bearing upon the subject of community property, such property practically follows the same rules as are applicable to property held in joint tenancy, that is to say: Upon the death of the wife, one-half of the community property belongs to the surviving husband, the other half is subject to the testamentary disposition of the wife, except that she cannot will that property to any one other than her husband or children by marriage without the consent of the husband indorsed on the will in writing. In the absence of such testamentary disposition the entire community property goes to the surviving husband without administration. In case the wife does make testamentary disposition of her half, the entire property is subject to the community debts and expenses of administration. The husband shall be continued in the management and control thereof and from time to time account to the estate. Upon the death of the husband one-half of the community property belongs to the surviving wife and the other half is subject to testamentary disposition of the husband under the same limitations as provided in the case of the wife, but in the absence of such testamentary disposition, it all goes to the surviving wife upon administration. The one-half of the community property belonging to the surviving spouse is not subject to any inheritance tax, nor is it to be reckoned as part of the estate for the purpose of fixing the compensation of the administration. The whole of the property may be held for inheritance tax. In the case of the death of the wife leaving no will, the fact of such intestacy and of her death may be determined by filing a petition alleging the facts, which upon proof results in a decree establishing the fact of death and that no will was left. In order to vest property in the survivor under a joint tenancy deed an exactly similar petition and decree is required.

Son Tries to Claim Property

My son is living with me, working on my place. He verbally agreed to work the place for a share of the profits during his life and his share of land after my death. He has invested no money on the place, except what I furnished him and what he made on the land. He now wants to own the land, threatens me with suits for his labor and makes life miserable for me. Can I homestead the land in order to avoid any claims which he may make, or what can I do?—Subscriber.

As the agreement between you and your son was a verbal one, which could not be performed within one year, it is void by the statute of frauds. There is a presumption of law that where relatives reside together upon a place and the one renders services in respect to the place to the other, that the law will imply no promise



The New 12-20 RUMELY OilPull TRACTOR

Cheapest in Cost per Year of Service

On what basis are you going to buy *your* tractor—by the dollar of cost or by the years of service?

Advance-Rumely is one tractor manufacturer who insists upon putting quality first. By quality we mean rugged, dependable construction, surplus power, real fuel economy and all around service.

In building the new 12-20 OilPull, Advance-Rumely refused to put out a cheap, lightly constructed tractor. We know and you know that durability can't be combined with cheap, light construction. And if a tractor won't "stand the gaff" nothing else about it counts for much.

We have embodied the proved OilPull ruggedness and substantial construction in this small, light weight 12-20. And by light weight we mean *right* weight—the proper weight to give long lasting, year after year, dependable service.

Like all OilPull tractors, the 12-20 is backed by a *written guarantee* to burn successfully all grades of kerosene under all conditions, at all loads to its full rated brake horsepower.

And just as Advance-Rumely guarantees its OilPull tractor as a cheap fuel burner, it insists upon giving the purchaser a surplus of power. The 12-20 rating is based upon only 80 per cent of its maximum power efficiency—a 20 per cent overload capacity when you need it. This means further insurance of long life—a tractor that will be doing the same good work five years hence as in its first season.

The 12-20 is oil-cooled—no evaporation and the radiator can't freeze. The circulating system is always open and oil preserves the metal parts. The OilPull cooling system keeps the motor at the right temperature at all loads—the harder the OilPull works, the cooler it runs.

On the 12-20 the belt pulley is on the right hand side—up within full view of the operator. The 12-20 can be lined up with a belt machine, backed into the belt and the belt started and stopped from the platform. The belt pulley is driven direct off the crankshaft—no loss of power.

The 12-20 OilPull will pull three 14-inch bottoms under ordinary conditions and a proportionate number of disc plows. It will operate a 22-inch thresher fully equipped and economically handle all other power jobs, drawbar or belt.

To safeguard the customer's best interests Advance-Rumely maintains 27 branch offices and warehouses, each equipped to give immediate service in machinery, parts and expert help.

The wise farmer will buy a tractor by the year—not by the dollar. Just as the OilPull will plow an acre at lower cost than any tractor built, its cost measured in years of service makes it the cheapest tractor obtainable.

Ask for the catalog describing the new 12-20.

ADVANCE-RUMELY THRESHER CO., *Inc.*
La Porte, Indiana

San Francisco, Cal.,
17-19 Main St.

The Sweetness of Low Price never equals the Bitterness of Poor Quality

Fuel—Guaranteed to burn kerosene successfully under all conditions.

Cooling—Oil cooled—no evaporation—non-freezing.

Motor—Heavy duty, 2 cylinder 6 in. x 8 in.—560 R. P. M.

Crankshaft—Built to U. S. naval specifications.

Frame—Hot riveted steel members—no bends—no splices.

Transmission—Cut steel gears—enclosed and running in oil.

Bearings—Hyatt roller bearings in transmission and rear axle.

Governor—Fly ball throttling type—automatic speed regulation.

Belt Pulley—19 inch diameter—running directly off crankshaft—no intermediate gears.

Lubrication—Force feed and splash.

Speeds—Two forward—one reverse.

Drawbar—Adjustable spring drawbar.

ADVANCE-RUMELY

ADVANCE-RUMELY

upon the part of the person to whom the services were rendered to pay for such services, but upon the other hand, presumption is that they live together and serve one another for mutual convenience. As the agreement between you and your son is void by the statute of frauds, he could only recover upon the implied promise to pay the reasonable value of the services, but as seen the law does not imply such a promise under the fact stated.

The homestead law applies up to $5000 to all heads of families. The head of the family is every person who has, residing on the premises under his care, and maintains, a minor child, child of deceased wife of husband, minor brother or sister or minor children of said deceased brother or sister, father, mother, grandfather or grandmother, or such relatives of the deceased husband or wife, an unmarried sister or other relatives mentioned who attain the age of majority and are unable to care or support for themselves. The homestead up to the value of $1000 may be selected by any other person. Homestead so selected is exempt from execution upon any claims other than for a mechanic's lien or other encumbrances upon the property.

Questions and Answers

ANSWERS BY EDITOR AND STAFF

Questions to be answered in this department should be received at the office one week before reply is expected. Write plainly on one side of the paper and sign full name and address. Unsigned communications receive no attention.

Sour Crop

I have a young gobbler whose crop fills up with water. Have tried giving him castor oil but the quickest way to remove it seems to be to hold him up by the feet and work the crop gently. There do not seem to be any solids in what he throws up. He eats fairly well, droppings are normal but thin, and he has lost all the feathers off his breast. He runs on a large range and I do not feed any grain at home.—Subscriber, Oroville.

Perhaps your turkeys are not getting enough hard grain on their range. Perhaps too, they lack the grit necessary for grinding their food. All birds need hard grain to keep the digestive organs in good condition. It would be well, I think, to keep them shut up a portion of the day for a while, to make sure they are getting grit, grain and succulent green, which they may fail to get when they are out. Onions and onion tops chopped with rolled oats are excellent for keeping a turkey's digestion in order. To this may be added charcoal, unless the birds will eat it alone. Charcoal is a wonderful sweetener for a sour crop. If the grit, charcoal and green feed do not remedy the difficulty try a little bicarbonate of soda in the drinking water or mixed in a small quantity of moist mash, but keep grit and charcoal before the birds and make sure they have wheat or barley or both.—J. A. K.

Killing Morning Glory and other Weed Pests

Would like to hear from some one through your valuable paper who has had experience in killing out wild morning glory, sour clover, devil grass and malva.—Subscriber, San Fernando Valley.

The only entirely satisfactory weed killing arrangement consists of thorough cultivation. Early in the season the chisel tooth or deep working tool is to be preferred, but at this period, when moisture should be kept in the soil as much as possible, more shallow cultivation is to be preferred, so at this moment the long weed cutting knife is perhaps the best. Of course where land is old and foul the knife clogs badly and the use of A-shaped knives on the old A-cultivator or on the wheel cultivator proves more satisfactory and does not clog to any extent. Control with chemicals has not proved satisfactory, that is, where it is attempted on a commercial scale. If one pays no attention to cost it might be made possible but so far "main strength and awkwardness", or real work with the cultivator and strong enough team to pull through the weed patches, is the only satisfactory control.

Gum Disease

What is the remedy for orange trees infected with gum disease? How can I prevent this disease from spreading to healthy trees?—Subscriber.

The best treatise yet given on gummosis is that by Prof. H. S. Fawcett. An outline of his investigations was given in the Cultivator of August 6, 1914. In a word the process consists of cleaning away carefully all exuding gum and diseased appearing bark, cutting with a sharp knife down to clean healthy wood. The wound is then painted over with Bordeaux paste. A good formula for a small quantity is: One pound of bluestone (copper sulphate) dissolved in three quarts of water in a wooden, earthen or glass vessel; and two pounds unslacked lime slaked in three quarts of water in a separate vessel of any kind. When the lime is cool, stir the two together, making a slightly pasty light blue mixture. On a larger scale the formula would be 12 pounds of bluestone to eight gallons of water, and 24 pounds of lime to eight gallons of water. The bluestone is easily dissolved by suspending it in a sack at the top of the water over night. If the bluestone is pulverized and suspended in warm water it dissolves rapidly. Good lime that is not air slaked should be used, and after slaking it with the water it should be allowed to cool before being used in making paste. If covered to avoid evaporation each ingredient will keep indefinitely, but after mixing the paste slowly deteriorates. Where it is being used over a number of days or weeks, just enough of the wet slaked lime and the bluestone solution should be mixed to make paste enough to last for one or two days, leaving the remainder unmixed in separate vessels. It may be applied with large brushes as is whitewash.

Gophered Apricot Trees

In an apricot orchard I recently purchased are quite a number of trees where the gophers have eaten the bark half way around the trunk. The crop on these trees is maturing quite a bit sooner and the trees did not leaf out as well as the others. Is there anything I could put around the affected parts to save them from dying? —Subscriber.

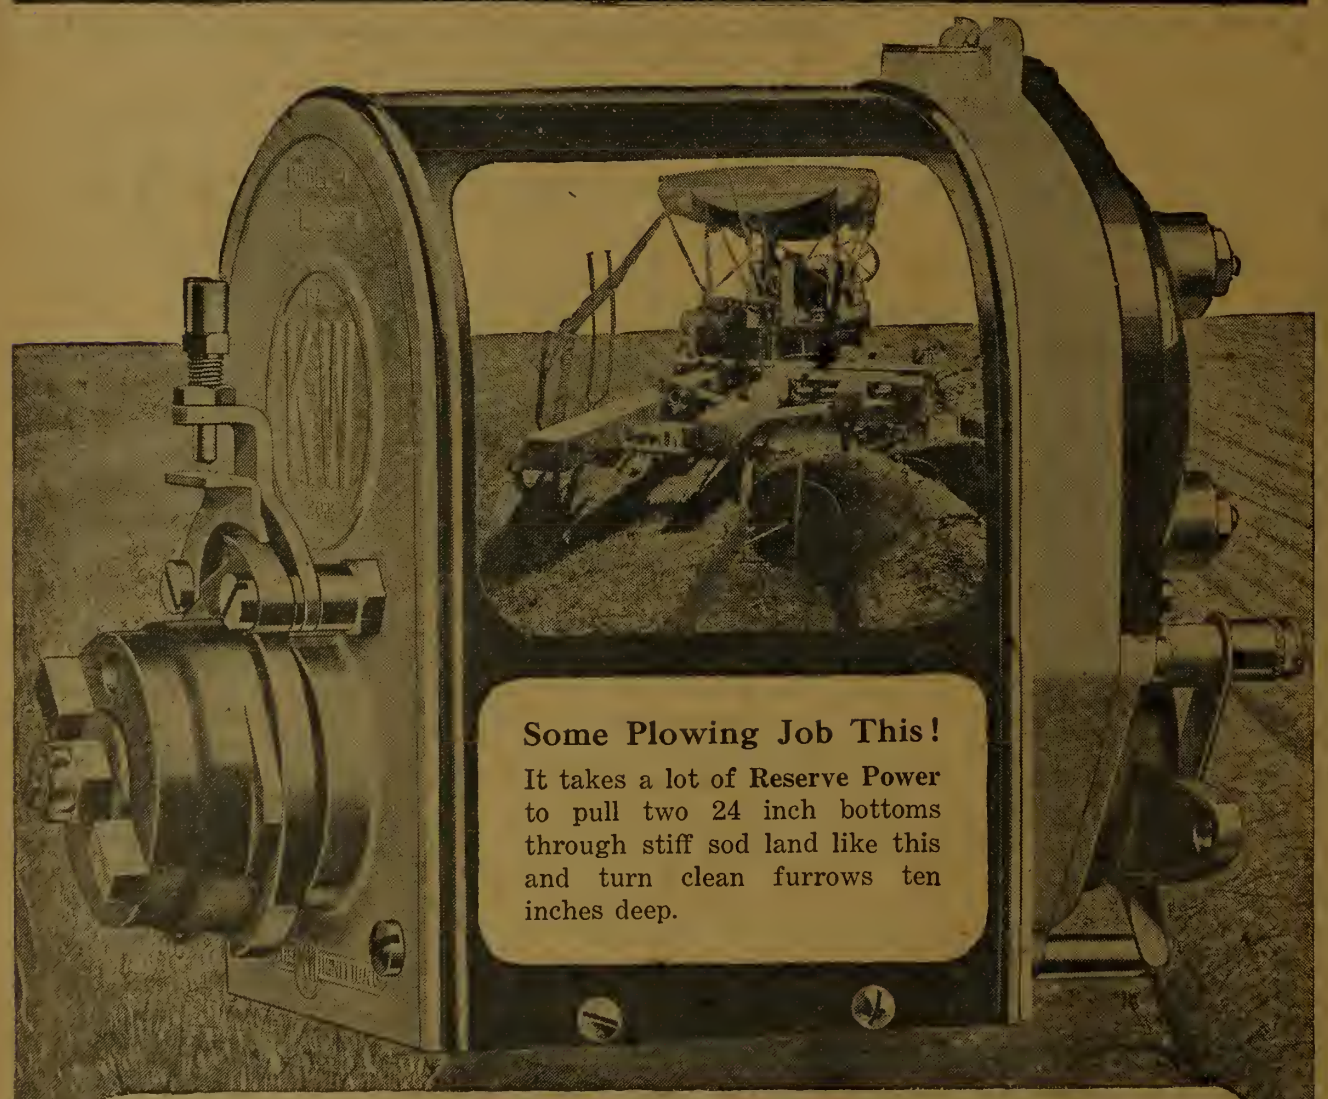
There is little comfort in trying to save apricot trees which have been gophered as long as these have been If the trouble is discovered as soon as done and the wound covered and kept moist until new bark forms the tree may go on and be but little the worse. But when the gophered portion has dried and, in fact, died, the base of the tree will be so weakened and the chances so against profitable bearing that it is possible the best method would be to remove and plant new and thrifty trees. However, trees in this condition offer a case for individual study as to whether they are worth the effort to save.

Campanula

What is plant which I send? It grows along the irrigating ditches.—Subscriber, Brawley.

This is a campanula, of the same genus as the hare bells, blue bells and Canterbury bells.

TRADE K-W MARK **High Tension MAGNETOS** Fire Any Kind of Fuel and Get Maximum Power Out of Every Drop Used



Some Plowing Job This!

It takes a lot of **Reserve Power** to pull two 24 inch bottoms through stiff sod land like this and turn clean furrows ten inches deep.

This Reserve Power is only available when the fuel is fired by the hottest spark known, such as that delivered by a K-W High Tension Magneto.

This K-W equipped Holt tractor pictured here makes easy work of jobs like this, because the K-W Magneto gives the hottest known spark, timed accurately. This intense spark fires the mixture rapidly, thus releasing the energy contained in the fuel in the shortest possible time and delivering maximum power to the piston.

Owners of K-W equipped tractors are also able to fire leaner mixtures and use cheaper grades of fuel and still develop full power from their engines. As a result they materially reduce their plowing cost per acre.

But of even greater importance than this fuel saving and reserve power is the Reliability of K-W Magnetos. This known reliability is only natural because K-W Magnetos are built for tractor service and made their reputation for reliability on tractors. Two manufacturers have used K-W Magnetos as standard equipment for over 9 years; 18 for over 5 years; as many more for from one to 5 years.

Time is the Only Test of Reliability.

Make sure the tractor you buy is K-W equipped. Write for a list of K-W equipped tractors and free booklet, "Plow This Additional Acreage Without Fuel Cost."

THE K-W IGNITION Co. (TRADE K-W MARK)

August 2, Butte City Ranch, Butte City.

Holstein Bull Sales

R. C. Sturgeon, breeder of Holsteins and Duroc-Jerseys, reports the sale of two young Holstein bulls just ready for service. C. H. Annis of Shafter got one and the other went to Fackler Bros., Lemoore.

Ships Berkshire to Indiana

W. F. Sandercock, Sacramento, owner of the Natoma Rio herd of Berkshires, has just sold a sow pig sired by Baron Duke 201st, Omaha national grand champion, and from Princess Leader, to Moore Brothers of Zionsville, Indiana. This is of particular interest due to the fact that Princess Leader is the only Berkshire in the world sired by a world's champion and from a world's champion dam. The pig, Natomas Princess Leader, combines the blood of two world's champions and a national grand champion.

Looking for Black and Whites

J. E. Dugan, formerly one of the farm school boys at Davis, writes from the E. C. Schroeder farm, breeders of Holstein-Friesians, Moorehead, Minnesota: "Am out here gathering a little data on these big black and whites and getting a working acquaintance with some of the daughters of old Sir Pietertje Ormsby Mercedes.

National Swine Show to Des Moines

The National Swine Show committee has just completed arrangements with the Des Moines Chamber of Commerce, whereby the Fourth Annual National Swine Show and Exposition will be held at the Iowa state fair grounds, September 29 to October 4, 1919. The regular classification which has been used heretofore in this show will be followed, excepting for a very few minor changes. In addition a ham and bacon show and corn show will be held. Premiums are offered to the extent of about $500 for each of these divisions. On Monday, the opening day, the college students' judging contest in addition to other special judging contests, which will be announced later, will take place. Already enough teams have promised to participate in the college classes in order to insure its success. An added feature to the 1919 show will be the pig club round-up for which approximately $1,000 is offered. Pigs of various breeds, which have won in their respective counties, will be eligible to show in this contest. Special dispensation has been made for entry fees and pen rentals for pigs in pig club classes.

State Fair Premium List Issued

Chas. W. Paine, secretary of the state board of agriculture, has issued the premium list for the sixty-fifth California state fair which will be held August 30 to September 9, and copies of the same may be secured by addressing the secretary. Over $45,000 is offered as prize money in the various departments besides many special premiums offered by different associations. Several new features appear in the classification, and in some instances the rules have been modified to meet changing conditions and to modernize the show.

Farmers Interested In Coming Duroc-Jersey Sale

The interest being displayed by the farmers in the coming sale of Duroc-Jerseys by the Tulare County Duroc Breeders' Association is a sure indication as to how this breed stands with them, according to R. C. Sturgeon secretary of the association. Mr. Sturgeon, who is consigning 10 bred gilts by Golden Colonel and California Cherry Chief, states that with the exception of a few that will go into the breeders herds the entire offering of 600 head will go on the farms of Tulare County. As a result of this sale it is expected that a number of new breeders will be established who will assist in making Tulare County famous for its Duroc-Jerseys. Entering Tulare County from any direction one sees these signs—"Tulare County, the County of Good Roads." Sturgeon says the signs will soon read "The County of Good Roads and Duroc-Jerseys." Ample provision has been made for the entertainment of a large crowd and all are cordially invited to be the guests of the Tulare County Duroc-Jersey Breeders' Association, Wednesday, July 16.

Thompson to Judge Berkshires at International

Friends of Professor J. I. Thompson of the division of animal husbandry of the University of California are greatly pleased by the announcement made by L. E. Frost, of the Berkshire World, that Thompson will judge the Berkshire breeding classes at the 1919 International Live Stock Exposition to be held at Chicago. Thompson, who is in charge of the swine department of the university and who is secretary of the California Swine Breeders' Association, is regarded as one of the leading swine judges in the United States.

New Hog Records at Portland and Chicago

Last week record prices for hogs were registered at Portland and Chicago. On the Portland market the new record was set at 21 cents, and at Chicago hogs sold to 22 1/2 cents. California markets are scarcely reflecting the keen demand experienced at other markets.

True Back From Hawaiian Islands

Professor Gorden H. True, head of the division of animal husbandry, University of California, has returned from the Hawaiian Islands where he went to judge live stock at the Annual Territorial Fair. Professor True is enthusiastic over the progress being made in live stock improvement on the Islands and believes that that market can be developed by California breeders. He predicts that before many years Island herds will make their appearance in show rings of the Mainland.

Liquid Gas

For Citrus Tree Fumigation

Made from Areo Brand Grade Cyanide furnished by The American Cyanamid Co. of New York

Our plant is nearing completion and will be ready to make liquid gas in any amount required. As previously stated, we have made connections with the American Cyanamid Company of New York, which is going to furnish us with cyanide for our entire output of gas this season, at a price which makes it possible for us to furnish you the liquid gas at the rate of 65 cents per pound at the plant at Azusa. We will contract to do this in any quantity and the quality will be guaranteed under state inspection to be 96.98 per cent pure. Containers for same will be sold to you at the plant, at cost. Pumps will be about the same price as last year. Delivery has been arranged for at a price which will cost much less than you can afford to haul the same for, and this delivery is guaranteed to be satisfactory.

This gas is made under our patents granted by the U. S. Patent Office, and our improved methods and enlarged plant, built under specification of the most skilled engineers and chemists employed by the American Cyanamid Company, make it possible to render you the service that you will require, and our guarantee is backed by them.

We invite you to the plant at any time, and will be glad to show you its workings.

The University Dairy Herd

By F. W. Woll, Professor of Animal Nutrition, University of California

MANY of your readers will no doubt be interested in the production records of cows in the University dairy herd at Davis, shown in the accompanying table. The herd numbers 50 cows at the present time, the following grades being represented: Holstein, Jersey, Guernsey, Ayrshire and grades. In addition there are about 60 head of young stock—heifers, bulls and young calves—and four service bulls of the breeds stated. The grade cows, which are mostly high-grade Holsteins, are kept for experimental purposes and for the production of milk for the University creamery, while the pure breds serve the same purpose and are also used for teaching our students the characteristics of the main dairy breeds, judging dairy cattle, etc. The average daily production of the herd, including grades and heifers with their first calves, is at present for 38 cows in milk, 27.6 lbs. milk and 1.07 lbs. butterfat; average fat content 3.9 per cent.

The following are the service bulls kept: Holstein, Sir Colantha Juliana 2d, 98762; Jersey, Owl of Belleview, 106305; Guernsey, Squire of Richneck, 38809; Ayrshire, Lotus Jean Armour's Laddie (loaned to the University by J. Henry Meyer of San Francisco).

The list of advanced registry records given includes two seven-day records under 10 lbs. of butterfat (made by two 2-year-olds); 11 come between 10 and 15 lbs.; five between 15 and 20 lbs.; and three over 20 lbs., the maximum seven-day record being that of the Holstein cow, Korndyke Senorita, 194170, of 23.53 lbs. butterfat, corresponding to 27.46 lbs. 85.7 per cent butter and 29.42 lbs. 80 per cent butter.

No special effort has been made to secure high seven-day records, as it is considered that yearly or 10 month records furnish a much more reliable measure of a cow's capacity for dairy production. Of the yearly tests in the herd, 10 come below 400 lbs. of butterfat; 15 between 400 and 500 lbs; seven between 500 and 600 lbs; five between 600 and 700 lbs, and four over 800 lbs. The highest yearly record, 940.72 lbs., recently completed by the Jersey cow. Interested Jap's Santa, 296928, is 135 lbs. higher than her previous yearly record, which placed her at the head of Jersey cows in the state so far as yearly production is concerned.

The present members of the University dairy herd are largely of our own breeding and no large sums of money have ever been expended in building up the herd; it has been gradually improved through selection and careful methods of breeding and management until it must now be considered a most valuable herd and one that California dairy farmers and others interested may well be proud of.

The following table indicates a number of the top records of production made in the University herd:-

Regulations for Traffic in Tubercular Cattle

The regulation prohibiting, after July 1, 1919, the interstate movement of cattle for breeding or dairy purposes unless they are properly tuberculin-tested, will prove to be a long step toward the control of tuberculosis and its eventual eradication in this country, according to officials of the United States department of agriculture. It supplements and strengthens state regulations on this subject.

The object of the regulation is specifically to prevent the interstate shipment of diseased animals to cattle breeders or dairymen who are trying to drive out or keep tuberculosis from their herds. Cattle consigned to a public stockyard, and steers and strictly range cattle may be moved interstate without restriction under the new regulation.

Copies of the regulation, which has

been issued by the secretary of agriculture and is known as Regulation 7 of bureau of animal industry order 263, are being printed, and will be available soon for cattle owners, dealers, veterinarians and others who may desire them.

The regulation of interstate movement of cattle follows the same principle used successfully in the control of other animal diseases, and has been recommended to the department of agriculture by many cattle owners as an essential part of the campaign against tuberculosis, which is now getting well under way, and in which the federal government and 42 states are cooperating.

Cattle known to be tubercular may be moved interstate for immediate slaughter upon federal inspection. They must be marked for identification; must be accompanied by a certificate showing their condition, that they may be shipped interstate, and the purpose for which they are shipped; transportation companies must identify the cattle as tubercular on waybills and other papers; cars or boat compartments in which they are moved must he cleaned and disinfected under bureau regulations; and the cattle must not he transported in cars or boat compartments containing healthy cattle or hogs unless the latter are for immediate slaughter.

Pure-bred cattle which have been shipped interstate for breeding or feeding purposes, and which have reacted to the tuberculin test subsequent to such shipment, may be reshipped interstate upon proper certificate for purposes other than slaughter, provided they are consigned to the original owner at the same point of origin; the reshipment must be made within four months of the original shipment; they shall not be shipped to any state or territory that does not provide for quarantine of tubercular cattle; they can not again be shipped interstate except for immediate slaughter under government inspection; requirements of identification and disinfection must be observed.

Briefly, heifers may be moved interstate for feeding or grazing on certification that they will not be used for other purposes, and cows may be shipped interstate from public stockyards on affidavit to the same effect. Bulls may be shipped from public stockyards for feeding provided the owner or shipper makes affidavit that they are for feeding only, and the state to which they are shipped provides for quarantine. The regulations give further details.

Cattle from a herd officially accredited as free from tuberculosis may be shipped interstate if accompanied by official certificates showing they are from such a herd.

Tuberculin tests for the detection of tuberculosis may be made by veterinary inspectors of the bureau of animal industry at public stockyards or regular bureau stations or by a veterinarian of the state of origin, authorized by the state and approved by the bureau of animal industry.

Stray Thoughts of a Cowman

By A. L. Spellmeyer

The man who is cocksure about anything relating to cattle conditions and prices at the present time is merely lahoring in the vale of ignorance. Nothing is sure. Two and two should make four, hut don't. Supply and demand should regulate price, but a lot of other things including the sweet will of our all-powerful packers affect results.

Our country has millions less cattle and millions greater population than a few years ago. It has also thousands of medlcal and other writers who tell us to eat less meat, and consumption is affected. Hog meat has increased and ls the big staple. Cattle and sheep have not increased.

It was easy to foretell, in view of plentiful grass prospects, that the price of fat cattle was due to fall, but it seemed then plentiful, natural, cheap feed would result in a demand for cows and younger stock, which has not materialized.

The figures put a shortage in the Northwest of 600,000 head, a shortage in Texas of 40 per cent, of millions of head, and a shortage in California of 10 per cent, which is negligible, considering the fact that will be the safety margin learned by the cattlemen during the past two drouthy years. Notwithstanding facts, Texas has thousands of cows for sale, Arizona thousands more and Callfornia a few thousand also.

The feeder who held until May is badly hurt, especially the feeder who put expenslve meal and finishing feeds into 10-cent cattle and must let them go to market now or they will burn out. That feeder cannot get today 11 cents for meal-fed steers and must compete with the increasing grass-fat cows and steers at lower prices. The feeder who listened to the food demand and bought heavily of stockers and fed heavily and did not get in on a rush sale a month or two ago is contributing much cash for his patriotic and expensive impulse. Some are going to lose enough to just about break them, but most of them will merely cancel last year's profits as well as this year's and be lucky to quit even.

Who knows anything about the cow business? It would take some prophet to state what is to be the outcome, as the best men in the business are in a haze of uncertainty, and many are firmly of the opinion the market and conditions will he just what the large killers and food controllers wish to make them, no more, and no less. Eventually, "the piper must be paid" and we will face a tremendous penalty. Lack of cattle will mean lack of fertilization and affect a thousand industries which the average cltizen and politician thinks it has nothing to do with.

This killing of cows, this great drouth loss, this unprofitable return from breeding and producing stock and this very bad market will all, in a very few years indeed, bring a lesson and a result whlch would be a wise economic move to avert. Cattle production cannot be the sport of chance, of inadequate banking consideration and fight nature's hardships, drouth and severities of climate and disease. In other countries cattle production is fostered, encouraged and protected.

Many cowmen are fully convinced the time will not come when they have good natural conditions and good prices at the same time, as they have never come together during the last 40 years, except in a few

GLOBE "A1" FEEDS

Globe "A-1" Poultry Mashes
—with dry buttermilk

Baby Chick Mash

The nutritious hearts of whole grains, ground and scientifically balanced with real dried buttermilk to make a wholesome feed on which chicks thrive. Makes chicks live and grow in robust health.

Growing Chick Mash

A food designed to make chicks develop into egg producers in the shortest possible time. Contains real dried buttermilk. Should be fed until chicks reach age of 5 months, then get

Globe "A-1" Laying Mash

for quick results in the egg basket. Contains real dried buttermilk. The use of buttermilk in poultry feeding has the indorsement of U. S. Agricultural Dept. (See Bulletin 162, Berkeley, California)

Health-giving lactic-acid Bacteria of Buttermilk

Put prosperity into your poultry yard. Start on these three great feed today. See your dealer—he has all the Globe "A-1" Feeds.

GLOBE MILLS
Los Angeles San Francisco

Globe "A-1" Swine Feeds
—with dry buttermilk

Three kinds, one for baby pigs, one for growing pigs, one for fattening hogs. Scientifically compounded to suit age of animal. All kinds contain real health-giving dried buttermilk, in correct proportion to make animal grow, mature rapidly and take on a load of profit-making fat. Ask your dealer.

Globe "A-1" Stock Feed
—with molasses

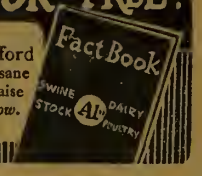
A well-balanced ration containing the proper amount of such concentrate feeds as soya bean meal, milo maize and other grains in combination with chopped alfalfa and dessicated bean straw. The whole ration treated with heavy addition of Hawaiian *cane* molasses. Palatable, nutritious—a winner either as a dairy or a fattening feed.

Globe "A-1" Dairy Feed

A high-protein concentrate to balance roughage available on your ranch. All we ask you to do is to weigh up the milk before and after feeding this remarkable feed for a few weeks.

Get the FACT BOOK FREE!

—here is a book you cannot afford to be without. Practical, sensible—a sane talk by experts who know how to raise poultry, swine and stock. Write for it *now*.



The Big Auction Sale

Butte City Ranch

Second Annual Sale

Butte City, California

Saturday, August 2, 1919

50 Registered Shorthorns Consisting of 38 females and 12 bulls, representing some of the most desirable families of the breed, practically all Scotch and Scotch topped cattle. Such good bulls as Victor Stamford, Vermillion, Crescent Dale, Gibson's Goods, Ringleader, Sir Type, Rex, Gloster Archer, Roan Chancellor, White Duke, and Perfection are represented in the sale by sons and daughters.

125 Registered Shropshires We believe that buyers in California have never before had an opportunity to secure such choice registered Shropshire sheep in a public sale in this state. Their breeding is of the best, representing drafts from some of the foremost flocks of America, and the offering is in splendid condition. There will be 35 mature ewes, 35 ewe lambs, 35 yearling rams, and 20 ram lambs in the sale.

50 Registered Berkshire Hogs The Berkshires on Butte City Ranch are almost too well known to need more than a simple announcement that some of them will be offered at public sale. The offering in this event will consist of choice gilts and a few good young boars, every one of which is by a son of the world famous imported boar Epochal, or by a grandson of the world's grand champion boar, Grand Leader 2nd.

10 Shetland Ponies The Shetland Ponies bred at Butte City Ranch have found wide favor, and are handled to make gentle pets and playfellows for the kiddies. Some of the good ones have been selected for this sale.

A CATALOG OF THE BIG SALE IS NOW BEING PREPARED AND A COPY WILL BE GLADLY MAILED ON REQUEST.

spotted districts. Some of the men who have been rather successful in the cattle business in the past look for the present drive against high beef prices—and this does not of itself affect prices to the consumer to any degree—to succeed. Men have told me they think we have seen the highest priced cattle and that as soon as a recovery is made under readjustment we must face the importation problem of South American and Australian meats at lower figures.

The packers should worry as they have large plants in foreign countries and will supply whatever meat we eat. Their profits are probably greater in South America than in this country and they have few if any restricting laws as to prices and income tax profits.

The above may be pessimistic, but no one seems to know anything—as shortage doesn't mean demand and two and two don't make four when there is some one to monkey with the adding machine.

The cowmen have their associations which are very loose, but could, with the elimination of packers, speculators and all not actually engaged in cattle production, be made rather efficient in fighting for better conditions and markets. The brotherly spirit of the prairie dog and the rattlesnake is beautiful to contemplate, but the prairie dog always loses, and quite a few cowmen are rather suspicious and pessimistic toward this highly advertised Chicago cooperative measure which is going to solve all the differences which exist between cattle producers and the mighty packers.

It would seem a safe bet that cows will be cows before long and that the range cow will be something sought for, but such isn't the case right now. The packers may be very innocent, and the money condition have nothing to do with present slack prices, and it may be true the country is all turning anti-meat, and that consumption of meat has slackened. If that is the case these cow associations better get busy.

Walnuts are advertised, so are raisins. Why not advertise meat. That would meet even the support of the great packers and retail butchers. We hear that the meat eaters in the army were the boys who did the work and stood the gaff. The civilized nations of the earth are the meat eating nations. Why don't our associations advertise meat and run the quacks and nature fakers out with sheer weight of ink and argument.

Of course, we ought to have fair markets and some believe stockyards will help, but a lot of cowmen don't know what they believe and have been rapped so many times by so many sources during the past year they are without faith in the wisdom and power of sources which should protect such producing industries, and they merely figure things will be exactly as two or three men in charge in Chicago decide they will be.

BETTER CARE OF SHEEP PAYS

Seven farm sheep demonstrations were held last year in Missouri—flock owners cooperating with sheep specialists of the United States department of agriculture and the state agricultural college — the results of which, among other things, showed that it pays well to give sheep proper care. In two of the demonstrations, where grade animals were kept, one flock produced 108 per cent of lambs, which means that some of the ewes had twin lambs, while the other flock produced only 59 per cent of lambs, which means that a large number of the ewes did not produce any or that the lambs were too weak at birth to be saved. The wool from the first flock was sold at 66 cents a pound, while the wool from the second flock brought 64 cents a pound. The cost of feed of the first flock amounted to $7.05 for each animal, while the sheep of the second flock were fed at a cost of $1.34 each. The total cost, in the first flock, amounted to $8.36 an animal, as compared to $2.57 for the second flock. But the net profit a head—the point which is most important to all sheep raisers — was $5.74 in the first flock as compared to $2.22 in the second flock, and the net return on the investment amounted to 21.77 per cent in the first flock as compared to 15.23 per cent in the second flock.

MINERAL LACK BRINGS BREAKDOWN IN SWINE

Breaking down of hogs through the fracture of the thigh bones may be caused by a deficiency in the mineral ration of swine. Breaking down often causes heavy losses to shippers of live stock. Farm brood sows frequently break down while suckling pigs.

Experiments show that a deficiency of bone foods in the ration of growing animals may reduce the breaking strength of the bone by one-half without restricting its growth to a noticeable extent.

Calcium and phosphorus, the most important minerals required by swine, may be supplied by feeding bone flour, wood ashes, corn cob charcoal, or lime. Raw rock phosphate is frequently used, also. The two elements are especially deficient in corn, seeds, cereals, and cereal products. Skimmilk and tankage occupy first place as sources of mineral nutriment for the corn-fed hog.—Ohio Monthly Bulletin.

LET HER SWITCH!

Fly time is here. She will be more comfortable and give more milk. But wear a milker's mask. Protect your eyes from dirt and injury.

ELLEBY'S MILKER'S MASK

Light, strong, cool, comfortable. Eliminate the most disagreeable part of the milker's job—being lashed in the face by the cow's tail.

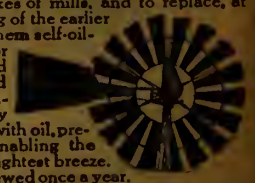
THE SELF-OILING WINDMILL

has become so popular in its first four years that thousands have been called for to replace, on their old towers, other makes of mills, and to replace, at small cost, the gearing of the earlier Aermotors, making them self-oiling. Its enclosed motor keeps in the oil and keeps out dust and rain. The Splash Oiling System constantly floods every bearing with oil, preventing wear and enabling the mill to pump in the lightest breeze. The oil supply is renewed once a year. Double Gears are used, each carrying half the load.



We make Gasoline Engines, Pumps, Tanks, Water Supply Goods and Steel Frame Saws.

CALIFORNIA A. R. PRIZE WINNERS

Superintendent Gardner of the Holstein-Friesian Association has issued a list of the prize winners for Advanced Registry work during the year 1918-1919. The list discloses the fact that 23 California breeders won prizes, thus giving this state fifth place. The California breeders appearing in the list, together with the amount of money won, follows:

A. W. Morris & Sons Corp. Woodland	$324.00
Bridgford Company, Knightsen	275.50
Palo Alto Stock Farm, Palo Alto	168.50
McAlister & Son, Chino	126.50
W. J. Higdon, Tulare	125.75
M. H. Tichenor, Palo Alto	113.50
A. J. Stalder, Riverside	97.00
E. E. Freeman, Modesto	90.25
J. H. Harlan Company, Woodland	78.50
Gotshall & Magruder, Ripon	65.50
F. W. Kiesel, Sacramento	58.50
Anita M. Baldwin, Santa Anita	48.50
J. J. Jeffries, Burbank	36.00
State Hospital, Napa	33.50
A. M. Bibens, Modesto	22.50
J. W. Benoit, Modesto	19.50
E. J. Weldon, Modesto	19.00
G. A. Smith, Corcoran	18.25
K. W. Abbot, Ripon	18.25
Dean Beeman, Woodland	10.00
R. L. Holmes, Modesto	7.50
Los Angeles County Farm, Hondo	6.50
University of California, no money award.	

STATE UNIVERSITY AT LOS ANGELES

The State Normal School at Los Angeles has been chosen as the site for the Southern California branch of the state university. Dr. E. C. Moore, present head of the normal school, has been named director.

The San Luis Obispo Live Stock Show

The San Luis Obispo County Live Stock Association held its first annual in San Luis Obispo, June 27-28. The awards given below show full list of entries, and from the success of the exhibit we presume it is but the forerunner of many successful shows in San Luis Obispo, one of the best live stock counties in California.

Among the winners were:

Percherons: Colony Holding Corporation; Clydesdales, White Triangle Ranch.

Saddlers and other classes: Forest Wood, Bob Taylor, Virgil Taylor, Perozzi Brothers, H. M. Warden.

Jerseys: E. H. Meinecke, J. W. McClain, Mrs. M. A. Brooks, George H. Andrews, Sinsheimer Brothers, Mrs. J. C. Weid, Forest Wood.

Holsteins: Lewis Dairy Farm, O. W. Birra, D. Machada, Pecho Ranch and Stock Company., George G. Ross, H. M. Warden.

Shorthorns: S. J. Lowe, D. Machada.

Poland-Chinas: Sinsheimer Brothers, Ross McMillan, Pecho Ranch and Stock Company, V. A. Martin, Ernest Hodges, Union Commission Company.

Berkshires: F. L. Sandercock, A. Rayburn.

Duroc-Jerseys: A. R. Barbick, W. E. Brayton, White Triangle Ranch.

Rambouillet Sheep: Pecho Ranch and Stock Company.

Sheep: O. V. Barlow, O. N. Blinn, Cris. Jesperson.

Goats: Clyde Pool, Stanley Dawe.

At San Luis Obispo Show

Three Shorthorns shown at the recent San Luis Obispo County Live Stock Association Show held at Polytechnic school grounds, from the Jack Lowe Ranch.

THE EDUCATED MAN'S CHANCE

Statistics lately gathered show that among 150,000 uneducated children only one has a chance of becoming prominent. Given a high school education, he has 87 times this chance; elementary schooling falls between these two, while college training increases the opportunity 800 times.

Formerly farmers feared that educated children would feel they had outgrown farm conditions and would look toward the city, but in these days when automobiles, modern household appliances, and especially the use of farm power machinery are increasing in every rural district, the farmer may well change this fear for the one that his children, unless well educated, cannot hold a leading position in their own community.

WATER AND FEED

The question of water and feed is the farmer's greatest worry. Stock must have both. A hot day in summer without water, or a scarcity of feed for a few days in winter can easily wreck your dairy profits for the entire year.

Dairy cows will not give milk unless properly fed. The surest way to feed is from a silo. By putting your green crops into ensilage you have a feed that is more nourishing, goes farther, and is an insurance against shortage during the winter. It is the one logical way to feed a dairy and is the secret of dairy success.

The Pacific is built to meet every requirement, give maximum service and yet be sold at a reasonable price. It is strong, serviceable, convenient, and will last a lifetime.

Pacific Silos are built of well-seasoned 2-inch Redwood staves with strong, fir door frames. Heavy steel hoops with cold upset threads and malleable iron lugs. Other *Pacific* features are self-supporting cover; hinged ventilators; hingeless doors and iron-tongue splicing. Foundation plans are furnished with every silo.

Investigate the *Pacific*. It's a perpetual *money* maker and safe investment.

HOW ABOUT THAT WATER TANK?

Let the *Pacific Tank* take care of your needs. Put in a system and have water all the time and where you need it. Water for your stock, dairy, kitchen, bath and lawn. A life-saver in case of fire.

PACIFIC TANKS

are built of heavy Redwood and bound with large steel hoops. Strong and everlasting. Fitted with patent non-shrinking system. Cannot shrink, leak, or burst. Always tight.

Write us about our non-shrinking system. Find out why it is that a *Pacific* never leaks. Write today.

This CONCRETE Manure Pit *will cost you nothing*

The horses and cows will pay for it.

Unless stable manure is kept so that the valuable liquid contents are saved, 50 per cent of the fertilizing value of the manure is lost. An average horse or cow produces annually manure worth $35. The liquid portion is worth nearly half of this. ***A concrete manure pit will save it all.*** So you see how the horses and cows can present you with a concrete manure pit free of charge.

Build one now and get the profits from this form of saving.

Ask for our free booklet telling how to build Concrete Manure Pits. Write our nearest district office.

Concrete for Permanence

What To Do When Cattle Bloat

The danger to the animal from acute bloating is not that the distended stomach may rupture, for such an accident is almost unknown. The pressure of the gas-distended stomach, however, exerts a dangerous pressure upon the heart and lungs, with the result that animals dying from acute bloating usually die of strangulation through inability to breathe with their compressed lung tissue.

The stock owner should guard against the bloating of his cattle by every precaution at his command. Clover, alfalfa, or other green vegetation, if eaten when wet by dew or rain, seem to be especially liable to ferment before leaving the first stomach of the animal that has fed upon them. Eating excessive amounts of middlings or corn meal will also cause bloating. It also occurs in cattle as a result of becoming choked. The principal cause, however, is overeating succulent green forage, such as clover, green corn, or cabbage.

Change Feed Gradually.

To prevent bloating the animals should be shifted by easy stages from dry or scanty feed to abundant and luxuriantly growing fodder. They may be allowed to feed from the good forage for only three-quarters of an hour on the first day they are given access to such grazing. A full hour may be allowed on the second day, and by continued slow steps and gradually lengthened stay in the tempting feed the danger of loss from bloating will be largely overcome.

But in case the first evidence of a too protracted stay in the heavy growth of forage should be that the owner notices one of his animals with sides distended and perhaps even lifted above the level of the backbone, he must act quickly. Removal of the gas from the paunch will quickly bring relief. If a veterinarian is within reach he should be summoned at once. If no surgeon is available, the owner should immediately attempt to bring relief to his animal.

Trocar and Method of Use.

Many cattle owners keep a trocar and canula constantly on hand and thoroughly understand its use. The trocar is a sharp pointed rod provided with a metallic sheath or canula which leaves the point of the trocar exposed. The spot to be selected for inserting the trocar is a point equally distant from the last rib, the hip bone, and the lateral bony projections from the spine in the region of the loins. Here a small cut about three-fourths of an inch long should be made through the skin with a small knife, and then the trocar with canula attached may be pushed through the cut into the paunch. The trocar is then removed, allowing the gas to escape through the canula. The canula should be retained in place so long as any gas escapes through it. Sometimes several hours are necessary, and the canula should be firmly tied in place. An attendant should remain near the animal, if possible so long as the canula is in the paunch.

Medicines That Relieve Bloating.

If the animal is not distressed by the bloating, and the swelling of the body is not great, or when the alarming conditions have been removed by the use of the trocar, it is best to resort to internal medicine to allay the formation of gas. Two ounces of aromatic spirits of ammonia in two quarts of cold water should be given every half hour, or half an ounce of chloride of lime dissolved in a pint of tepid water may be given every half hour until the pressure of the bloating has been removed. A dose of purgative medicine is usually beneficial after the bloating has disappeared. For this purpose one pound of Glauber's salts will usually prove effective.

Care should be used in the administration of fluid medicines. Take time. Do not hold the cow's head too high. Keeping the animal's head raised, so that her nose is slightly higher than the level of her face will allow her to swallow without interference.

Get Better Acquainted

The following from the National Stockman and Farmer is quoted as bearing a philosophy worthy of consideration by all who grow trees, shrubs or plants or who live upon the farm. The experience is that of S. J. Lowell, Master of the New York State Grange:

"I think the first thing that opened up the new vision of farm life to me was an eccentric old vine among the grapes. This fellow was one of the greatest fakers that ever lived. He fooled me for several years with his tricks and I couldn't help comparing him with a certain human being I had known. He would start out every spring with the other vines, strong and brave, making me all kinds of promises about the grapes he was going to bear. He would grow the most marvelous suit of leaves and get himself all dolled up, fit to kill, for all the world like a confidence man in real life; then, just as sure as harvesting time came, there he would be without a grape. Well, I finally cut off his head and grafted on another that was on the square and would grow real grapes without any bluff or bluster.

"With this as a beginning, my acquaintance with my farm family grew and prospered day by day, spreading to trees and flowers and animals, to garden truck and to everything else around the place. There grew up within me, along with this acquaintanceship, a sort of fatherly interest in all these struggling friends, and in the steady old wheel horses in all branches of the farm's life. I got to feeling that these plants and animals would show me very clearly, if I would just look, when they were happy and contented and properly taken care of, and when they were miserable and neglected. That is the feeling that makes a man a real farmer at heart. No man ever got it by hating his farm. Any man can get it by getting acquainted with his farm."

Farmer Putnam on Silos

A silo is a hole, entirely surrounded by a wall, fur storin' cow feed. Sometimes the hole is in the ground; sometimes it is up in the air. To build a silo, first select a nice spot fur the hole, then build a wall outside of the hole, if you want to build up, or inside of the hole if you want a pit silo. Either kind is good, but you got to go about it different. If you can't put up a silo, put one down, but don't put it off.

All kinds of material is good for silo buildin' exceptin' hot air. Good ones is made outen cement, concrete, cement staves, holler tile, brick, stone, wooden staves, steel or two-by-fours. We has 2000 silos in Colorado made of them above materials, and about 20,000 outen hot air. Most of the farmers has got the spot fur the hole picked out, but they hain't never begun to commence to build yet, fur some reasons or others. Some hain't got the money, some can't decide on the kind of silo, some sez it's too much work to haul the crop in and cut it up, some sez it makes the cows' teeth fall out, some sez it gives 'em holler horn and holler tail, some sez it makes the milk turn green, some sez the butter from the silage milk won't churn, some sez it makes steers scour, hawgs howl, and lambs limp. Anything to put off silo buildin'. I'm a tellin' you folks better get busy and look into this silo business; it'll mean money fur farmers that wants to make beef, mutton, or milk, and I know of some that feeds it to hawgs and lots of it is fed to hosses and mules. I wouldn't starve on it myself if I had to eat some good corn silage.—The Concrete Builder.

Live Stock Queries

Raising Dairy Calves for Veal

Seeing the query in the issue of June 21 and your reply I am writing you of my successful experience. I was milking a number of cows and among them was one old cow that was very hard to milk. She gave a good quantity of rich milk. I decided to let her raise the veal calves. She usually had two calves at a time. I would sometimes get calves of a dairyman at from $1 to $2 each and that old hard milker raised nine splendid calves that averaged $17 each. It all depends on the party doing the work of management.—S. A. M.

Breeding—Dairy Law

How soon after freshening would you advise breeding dairy cows for greatest yearly milk production? Where can I get a summary of latest dairy law that applies to the small rancher with but few cows?—Subscriber, Hemet.

It is quite generally conceded that persistent milk flow can be best developed during the first lactation period, and most dairymen feel that unless the milking habit is well developed at that time very little can be done later. The age at which a heifer should freshen will depend on the breed and general condition and development of the individual. There is no evidence that there is any apparent difference in production of cows freshening again six, 10 or 12 months after calving. For best results a cow should be dry from six weeks to two months between lactation periods.

The State Dairy Bureau, 268 Market Street, San Francisco, can give you the latest dairy regulations.

Protective Foods

From an address by E. B. Fitts before the Western Dairy Products Show, Boise, Idaho, we quote:

In the amount of new money produced the dairy industry stands near the top when compared with other agricultural activities, and as a source of an essential food product this industry stands at the top, at the very apex, in a class by itself. Careful and extensive experiments recently completed by Dr. E. V. McCollum of Johns Hopkins University, and other investigators have conclusively proven that milk contains a dietary essential without which children cannot grow nor mature life be long continued in a state of perfect health. This dietary essential is associated with the butter fat in the milk. It is also found associated with the fat in the yolk of eggs and in the leafy parts of plants. These three food materials are, therefore, classed by Dr. McCollum as "protective foods." Dairy products are by far the most important of the "protective foods" for they are much better adapted to dietary combinations for all ages and classes of people than are eggs or leafy parts of plants. Diseases peculiar to children such as rickets increase rapidly in communities where there is a curtailing of the normal milk supply. The spread of tuberculosis and other wasting diseases is more easily checked and their cure more rapidly accomplished where milk and milk products make up a considerable portion of the diet. Evidence is at hand to show that the physical, mental and moral development of peoples is largely dependent upon their diet. The races of Asia: Japanese, Chinese, Indian and Filipino are small in stature, short in span of life and high in infant mortality when compared with the races of Europe and America. A comparison of diet shows that the races of Asia live largely upon cereals, fruits, vegetables, leafy parts of plants, some eggs and very little milk. The races of Europe and North America use in their diet nearly all the foods that are eaten by the Asian with the addition of large amounts of milk. The nations that are leaders in literature, art science, music, invention and general accomplishments are those where the diet of its peoples contains milk and milk products to the extent of 15 per cent or more of the diet. We must revise our ideas as to the comparative importance of different foods in our diet. The Englishman has always attributed his boasted development of brains and brawn to the large amounts of rich, red, juicy roast beef he consumed. We know now that such physical and mental development as he has attained is not due to the rich, red, juicy roast beef he consumes, but to the milk and dairy products he uses in connection with his meat diet. Wide publicity needs to be given in our country to the importance of dairy products in the diet.

The rate of increase of our people is greater than that of our dairy cows. Our people have made it possible, through sacrifices, to ship enormous quantities of dairy products to suffering humanity across the sea. Substitutes are being consumed here in large amounts. There is danger that the amount of dairy products used by our people will be decreased to a point below that of safety. We feel that all who have the best welfare of our nation at heart should unite to propote the development of the dairy industry and the greater use of dairy products. We feel this to be of utmost importance and it will receive consideration at this convention. Among other matters that are to be taken up are the cost of milk production, manufacturing problems, the marketing and distribution of milk and dairy products, the improvement of the quality of dairy products, and the greater utilization of dairy by-products.

MAKING STRENGTH FROM MILK

Plenty of milk is one of the simplest ways of improving the general health of children, authorities believe, and home demonstration agents of the United States department of agriculture and the state colleges are making special efforts to create public interest so that every child will get his share. In some cities, where many children have been found undernourished and undersized, milk is served in the schools. In 19 Indianapolis schools 2,000 chilren have been served a half pint of milk each school day during the past year. The milk is delivered at the schools in individual half pint bottles. A hole is punched in the cap of the bottle and a straw is inserted. The children help themselves as they march past, and afterwards they return the empty botles to the rack. This work in Indianapolis is maintained by the parent-teacher clubs, but it is largely self-supporting. The majority of the children pay 3 cents a day, or 3½ cents for milk and crackers. Those who can not pay get the milk free. The children are measured and weighed, and the chart of each child is kept in his schoolroom, so he may see whether he is up to normal or below. All the children are much interested in weighing what they should. The teachers report a marked improvement in the schoolwork and want the work continued. The Indiana home demonstration agents cooperate with the county welfare committees in weighing and measuring the children.

The Department of Agriculture is issuing warning against confusing the rosy saltbush with Australian saltbush. The Australian has become established in this state as a valuable forage plant, but the rosy saltbush, although advertised as of value, the department considers on the same footing as the tumble weed and Russian thistle.

As the type of animal necessary for the production of large yields of milk is entirely different from that of the beef animals, it has been impossible to produce a breed which would combine these functions and be of superior merit for both purposes.

Prince Walker Cornucopia

The Highest Record Son of Prince Gelsche Walker

His dam: ALBA SADIE CORNUCOPIA CREETA has just completed official records of 36.26 pounds butter from 516.7 pounds milk in seven days. Her previous records were as follows:
At seven years—
Milk 338 days.....18,849.40
Butter 866.28
At six years—
Butter seven days 34.13
Milk 532.40
At five years—
Butter seven days 28.85
She is a daughter of Sir Sadie Cornucopia, son of the first 30 pound cow, Sadie Vale Concordia.

Over 60 of our best females are bred to PRINCE WALKER CORNUCOPIA, and he will be given the fullest opportunity in this herd. Put one of his young sons at the head of your herd.

Santa Anita Rancho
Anoakia Breeding Farm
Santa Anita, California
Anita M. Baldwin, Owner W. H. Taylor, Supt.

His Calves Are Beauties

Every one who is fortunate enough to own a son or daughter of KING KORNDYKE PONTIAC 20TH our $6500 herd sire, is enthusiastic about the splendid type and beautiful marking of his calves. While they are only babies his daughters show great promise of developing into exceptional dairy cows.

King Korndyke Pontiac 20th

His young sons are moving fast, and it will pay you well to see us now about one for your herd, for we are not going to be able to fully supply the demand for some time to come.

Our Entire Herd is Tuberculin Tested
Tulare Holstein Farm
W. J. Higdon, Owner TULARE, CAL. H. L. Redd, Herdsman

Sir Aaggie De Kol Acme 2nd

Five of his seven nearest dams average:
Milk one year....24,089.88 pounds
Butter ..... 1,105.07 pounds
This butter average is equalled by only one other bull of service age in the world. Buy your next bull from
Eldorado Herd
Alex. Whaley, Owner Tulare, Cal.

Are You Satisfied

with the returns from your present herd? Our milking herd of 300 cows averages one pound of fat per day. What is your average? Ours is due to good cows by high class sires. We have 5 bulls all bred for increased production. Senior Sire, Sir Veeman Korndyke Pontiac, a son of Sir Veeman Hengerveld, the sire of more 30-lb. cows than any living sire. We can sell you a young bull at a very reasonable price.

BURR FARM Los Angeles, Calif.

GOING FAST, SO ACT QUICKLY

Five young Holstein bulls have left Sunnyside Farm past month to head other herds. We have for sale a few select sons of Sir Veeman Korndyke Pontiac by Sir Veeman Hengerveld, the sire of more 30 pound cows than any other living sire. Full description and price on request.

CATTLE

110 HEAD OF DAIRY
COWS AND HEIFERS
Fordson Tractor, Implements, Horses
On the J. J. Brinkman Ranch, in the WEED PATCH, 14 miles south of

BAKERSFIELD

FRIDAY, JULY 18TH AT 10:00 A. M.

We are instructed by the owner to dispose of this choice herd of selected dairy cows on above date to the highest bidders, POSITIVELY WITHOUT LIMIT OR RESERVE.

The owner has carefully built up this herd, and has culled out every unprofitable cow, until today it is a herd of merit. There are 60 fine cows, all young and in the best of condition. Holsteins and Durhams, many now fresh and giving large quantities of milk; also a number of fine springers. 50 high-class Holstein heifers, yearlings to 2-year-olds.

If you are in the market for first-class dairy cattle don't overlook this fine herd.

Implements, Fordson tractor, plows, cultivators, mowers, rakes, wagons, harrows, cream separator, all dairy equipment, etc. Also all household goods.

CONSISTENT

"You describe yourself as a conscientious objector?"

"I do."

"But you put on the uniform."

"I had a right to. I conscientiously objected to leting other people do my fighting for me."

Figures That Tell the Truth

By Jean A. Koethen

(Continued from last week.)

Cost of a Hen

The cost of a dozen eggs is not merely the cost of the feed the hen consumes. It is the cost of feed plus what is called overhead; that is, interest on investment, labor and other expenses. On this chart there are seven items of overhead:

Interest (seven per cent on investment of $3 per hen, including value of hen as $1), $0.21.

Taxes and insurance, $0.03.

Death loss, five per cent, $0.05.

Replacement cost (cost of producing a pullet in excess of meat value of hen), $0.25.

Repairs (depreciation, etc.), $0.20.

Labor (in excess of proprietor's fair time), $0.35.

Incidentals (express, stationery, etc.), $0.11.

Total per year per hen, $1.20; per month, $0.10.

The feed cost of a hen in 1918 averaged 21.74 cents per month. Adding the ten cents overhead, we have 31.74 cents as the cost of keeping a hen a month, regardless of how many eggs she lays. The cost of a hen for a whole year is therefore around $3.84. How many eggs must she lay to be worth her keep?

In these calculations it is assumed that a hen will lay 120 eggs per year. Ten dozen eggs at last year's average of 51.6 cents are worth $5.16, a profit of $1.56 per hen. At the average of 35 cents, which was received in 1917, when the feed cost was only 72 hundredths of a cent less than last year, the income per hen would amount to $3.50, and the net profit be turned to a net loss. It appears, therefore, that until feed prices drop considerably the price of eggs should be maintained at the present level.

When a Hen Lays

If a hen lays 120 eggs in a year how are they distributed through the various months? This, too, is a question of averages. Knowing that the average hen does her best laying in March and April and her poorest in October and November, it is not difficult with the figures for monthly production of a large number of hens over several years to calculate the average lay for each month. The lay assumed on this chart is: January, 8.25; February, 12; March, 15.75; April, 16.75; May, 15.75; June, 12; July, 11.25; August, 9; September, 6.25; October, 4; November, 3.25; December, 5.35. These figures are important only in case a producer wishes to figure his profits month by month, but they are interesting as showing just what is to be expected from month to month. An average lay of 16 or 17 eggs in April is not large. Most commercial poultrymen expect a bred-to-lay hen to do better than this. Certainly if she did less, without some outstanding reason, her owner might well mark her as a slacker.

Drives of all kinds have been much in fashion for two years past. Is it not time for one of a litle different kind? Not a drive for funds, but an educational drive for the dissemination of these fundamental facts regarding the poultry industry? The fact that eggs are at present bringing a fair profit is no guarantee of justice in the future. The country is full of men and women who are ready to declaim at the slightest provocation against the prices of eggs. Housekeeping columns are full of egg substitutes and eggless recipes. Why not let the public know what it costs to produce a dozen eggs and how much the producer actually has for his own use when he sells them at 50 or 60 cents? Why not advertise the purity and efficiency of this best of all foods as widely as certain much less wholesome foods are advertised? Why not write on every hillside and flash out in the darkness of every city some legend to remind the public that in an egg is contained more real nourishment than one can buy for five cents in any other form? The poultry industry needs advertising more than any other business. It has the goods, and it sells them cheap, all things considered. Let the consumer know it.

STORRS EGG LAYING CONTEST

Storrs, Connecticut, June 27, 1919.—Report for the thirty-fourth week ending June 26. In the thirty-fourth week of the laying contest at Storrs the total production for all pens amounted to 3837 eggs, or a yield of 54.8 per cent. This is a slight drop of about three per cent over last week's production. First place for the week was won by a pen of White Leghorns owned by J. Frank Dubois, East Lynn, Massachusetts, with a total of 60 eggs.

With the coming of the hot season the poultryman's greatest problem is not so much how to get more eggs this week than the week before, but rather how to prevent egg production from dropping too rapidly. Just a suggestion along this line may be helpful. Since the proportion of water in a bird's body is about 55 per cent, and that of the egg 65 per cent, it can be seen that water is a very important factor. Not only this, but allowing the hens to get out early in the morning and stay out late in the evening in order that they may have an opportunity to search for earth worms and bugs during the cool parts of the day is beneficial to egg production.

The three best pens in each of the principal varieties are as follows:

Barred Plymouth Rocks

Jules F. Francais, 1346; Laurel Poultry Farm, 1277; Ingleside Farm, 1150.

White Wyandottes

Curtis L. Allen, 1244; W. Bradley, 1184; Patrick F. Sullivan, 1062.

Rhode Island Reds

Laurel Hill Farm, 1303; Deer Brook Poultry Farm, 1184; Chas. H. Lane, 1137.

White Leghorns

A. P. Robison, 1228; Hilltop Poultry Yards, 1211; D. Tancred, 1152.

Miscellaneous

Pequot Poultry Farm (R. I. Whites), 1128; Chickatawbut Farms (Wh. Rocks), 1120; Holliston Hill Poultry Farm, 949.

A PIPE LINE TROUBLE

Pipe lines sometimes have a trick of letting the water swing back and forth in them like a pendulum and occasionally flooding over the tops of the standpipes. The irrigator will have various remedies suggested to him but finds that the same remedy does not always work alike on different lines. The writer has had a bad case of this kind and has found that most people do not know what is the cause or how to correct it. One man is said to have paid $100 to learn to control this aggravating condition. A successful way for any line is to cause just enough friction in the line to bring the swinging to a standstill. This can be done by partly closing the line at several points, leaving just opening enough to let the water through and no more. The cause and cure can be put in five words:

Pipe too big; choke it.—T. M. N.

Keep a smile on your face and a laugh in your heart;
Let your lips bubble over with song,
'Twill lighten your load as you travel life's road,
And help other people along.

WELL, EVEN THAT WILL HELP

"They say food is going to be cheap pretty soon," remarked the hopeful chap.

"No," said the man who loves to look on the dark side; "it isn't going to be cheap — it will merely seem cheap by comparison."

I'LL SAY SO

Betsy, an old colored cook, was moaning around the kitchen one day, when her mistress asked if she were ill.

"No, ma'am, not zactly," said Betsy. "But the fac' is, I don't feel ambition 'nough to git outen my own way."

PHILIPPINES GROWING

Some of the advancement which has been made in the Philippine Islands is to be noted in the annual of the Manila Daily Bulletin, its regular anniversary number for 1919. There are scores of well-executed half-tones giving industrial and agricultural scenes, together with many photographs of some of the doers of things on the islands. The advantages of American occupation are indicated, for certainly this number is representative of American style.

Book Review

PRODUCTIVE SHEEP HUSBANDRY

"Productive Sheep Husbandry" by Walter C. Coffey, professor of sheep husbandry in the University of Illinois, published by J. B. Lippincott, Philadelphia; $2.50 net.

California is manifesting greater interest in sheep production now than at any time since the old "grain, wool, hide and tallow days". This book will be invaluable for the wool grower whether it be on the ranch, or, as more common in later days, for the small "flock master" on the diversified farm.

Professor Coffey has gathered together invaluable data on the most successful methods and practices of the sheep industry and put this knowledge in clear and systematic form, easy to refer to and to understand. He has illustrated his book with a remarkable series of illustrations, as helpful as the text.

Part I. History of Sheep Raising and of Sheep Breeding. Covering the development of sheep raising and the present type of sheep in the great sheep countries of the world, problems and methods of improving sheep; II, Structure and Judging. A richly illustrated study of the structure of the sheep, its nature, types and how to judge; III, Breeds. A very fully illustrated section dealing with all of the important breeds, mutton breeds, Southdown, Shropshire, Suffolk, the American Tunis, Merino, etc.; IV, The Management of the Flock. Giving the best methods for establishing the commercial farm flock, mating, care of ewes, lambs, summer management, the wool crop, etc.; V, Sheep Feeding. History of sheep feeding in the United States, market classes of sheep, autumn and winter feeding, shelter, factors affecting profit, and feeding sheep and lambs in the field; VI, Sheep Management on the Ranges in the Western States. Nature of the range, and suitable types of sheep, their management, and important changes in range conditions in the last 25 years; VII, Miscellaneous. Covering building and equipment for farm flocks, preparing mutton on the farm, and a complete index.

THE RIGHT OF WAY

I've ceased to ride with Ezra Green,
Who drives a fine, high-powered machine;
I'd rather walk for miles in dust,
Than let him hold my life in trust.
On hot and sticky days, by far
I'd rather take a trolley car
Than risk the dangers of the street
On Ezra's richly cushioned seat,
For Ezra is the sort of jay
That boasts about his right of way.

Bound north or south, he gives her gas,
And will not let a stranger pass;
At crossings never once he slows
But madly on the road he goes,
And when I mention caution, he
Then scornfully looks back at me
And this is all I hear him say:
"Don't fret. I've got the right of way;
The other chap must careful be,
It's up to him to stop for me."

It's hard to sit in comfort cool
Beside a driver who's a fool;
Although I have a worthless neck,
I would not risk it in a wreck,
Nor would my precious blood I draw
By folly countenanced by law.
It would not help when I am dead
And my poor soul above has fled,
To have the judge and jury say:
"Deceased possessed the right of way."

So now when reckless Ezra Green
Invites me into his machine,
Politely some excuse I give
And spurn his ride, that I may live.
I fear too much, when I am out,
The right of way he boasts about;
This thought is always at the top:
Some day the other chap won't stop.
And graveyards choke with men today
Who trusted to their right of way.
—Edgar A. Guest in "Milestones."

A SUCCESSFUL FAILURE

"YOU couldn't marry a farmer, Laura?"

The girl's lips set themselves in a hard line.

"Yes," she said doggedly, "I could."

"But—" he hesitated, "you couldn't—and be happy?"

"No."

"I'm sorry you've decided this way."

"I've always wanted to go to work in the city, Tom. Father promised I could go when I had graduated from the grades. Then that year mother was ill and I had to stay here. I'm going now."

Her face softened into tenderness as she spoke of her dead mother. "It's lonesome here now," she went on. "I can't stand it here any longer."

A week later, standing in the long line-up of girls, outside the office of the general superintendent at Benemaker's department store, she remembered her reply.

Her feet ached with an hour of standing. A seat near the blanket counter beckoned invitingly to her but the seat was not in the waiting line and if she stepped out of the line she would lose her place and have to work up again. The line-up ahead was long; back of her it was longer still.

A girl emerged from the superintendent's office with an application blank and retreated to a chair where she wrote painstakingly. The four girls next ushered into the superintendent's office consumed not more than four minutes of his time and came out empty handed. Then came a woman of perhaps forty. She too, carried a blank sheet in her hand as she left the office. Her suit, Laura observed, was old and worn.

Busily watching those ahead of her, Laura presently found herself face to face with the superintendent. The one year she had clerked in the little store at home gave her some prestige and though she too emerged with the blank to be filled, the superintendent had not given her definite encouragement.

There were other places. In her handbag she carried a clipping which stated that the manager of a certain office would interview applicants at eleven o'clock. Thither she hastened, walking to save her nickel. She arrived at 20 minutes of eleven. Five other girls were ahead of her.

The glances of the five were condensed into a formidable look that was hurled straight at Laura who, thus rendered selfconscious, sat down upon the end of the waiting bench.

"I suppose," she said with an attempt to speak friendly, "that we're all here on the same mission so we might as well get acquainted to shorten time. I've been on my feet all morning and I'm glad to sit down."

The girl next her relaxed and smiled. She had been working for four dollars a week she said but she lived at home and did not have to pay for room or board. Four dollars a week bought most of her clothes, at least.

"But you can't live on four dollars a week, you know," she informed Laura.

The girls kept on coming. Laura counted the twelfth and then watched the unlucky thirteenth. When Miss Thirteenth came she was a rosy-cheeked little thing—real roses, those were. Her hair was prettily fluffy and her eyes were bright. She did not look at all unlucky. The manager summoned the girls one at a time into his office.

A few moments later the manager's private secretary came out and announced the third girl interviewed had been retained and the rest were dismissed. Laura walked downstairs at the side of the girl who had been working for four dollars a week. At the corner the girl stopped.

"I turn here. I'm going to hunt for something else. Good luck to you and remember, if you don't live at home that you can't take anything less than eight dollars a week and get away with it. And say, try to get them to make it ten! You'll really need ten."

Suddenly a wave of lonesome feeling swept over Laura. She went to the room that she was renting at three dollars a week and wrote to Tom. Tom would be looking for a letter and perhaps if she did not write, he might look her up. She told herself with sophisticated philosophy that you never can tell what a man will do.

The letter mailed, she bought another paper and turned to the want-ad page. Finding a promising advertisement she hurried out again. She found a heavy, surly man who was indisputably the "boss," a surly clerk and a surly stenographer. The stenographer had just been given notice and there was fight in her eyes. Bad as the place was, it was better than job hunting.

While she waited, a girl of the fluffy, ruffly, gum-chewing sort came in. Laura glanced at the topsy-turvy head, glad that her own hair was brushed smooth. Someone had told her that office managers like sleek-haired girls. The fluffy, ruffly one, however, brought a personal letter of recommendation from an important person. In consequence, she of the fluffy hair and ruffly blouse was given the place. Laura regretted for the first time her own smooth hair.

The manager had asked her to come back to Benemaker's early next morning. She went but again a long line was ahead of her. Two girl clerks stood near by, waiting to see the "boss." One was relating her troubles.

"I missed just a half a day Friday," she was saying crossly, "and she called it a day, the old hag! I can prove that I came after lunch. I was sick in the morning."

"Trouble, honey?" the other answered with sweet sarcasm. "Oh, never mind! One old dame took all morning of my time and never a sale."

One young man in the line reminded her of Tom. She had not forgotten her promise that she would marry him if she failed.

She was put to work at the stationery counter.

She knew nothing of stationery but she could read prices. To do that, she thought, and look pleasant, was about all there was to selling stationery. After the first day or so, looking pleasant was not easy. She was not used to standing all day. Even on the farm, work had never been so wearisome as this.

The others told her that it would be hard at first. They were used to it now. On the evening of the second day she was growing a little more accustomed to the work but it was difficult to appear as gay as the other girls near her counter. Every night they went to a dance or a movie while she returned to her three-dollar room, to take off her shoes and bathe her tired feet in hot water carried up two flights of stairs.

Gradually she learned more of her work. At the end of the month she received a small rise in pay. It was some encouragement and she stayed. Meantime, she wrote regularly every week to Tom. In her letters she said as little as possible about her work. It had not been as she had thought it would be.

She continued to bathe her tired feet at night in a basin of water brought up from the first floor and to eat meals much unlike those cooked on the farm where one never stops to wonder whether the milk really came from a cow and whether the eggs were really laid by a fowl or made in a factory.

In another month she earned a second small rise. The Christmas rush was approaching. That meant harder work and longer hours. Every night, along toward Christmas, the tall blonde was so tired she could just drag herself to put the embroideries back into place, and the small brunette lagged wearily as she rolled up yards and yards of colored ribbons. The other girls grew to look so wan and pale that Laura hardly dared look at herself in the little ten-by-twelve mirror that hung above her washstand in the three-dollar-per room, for she had heard that a country girl fades more than a town girl when she is suddenly put on heavy work and light diet.

Then, just before Christmas, Tom came.

Laura knew that he was coming. His train would arrive about eight and that night he would come down to the shop and walk home with her. It was Saturday night and she must work until nine that night.

Just before nine o'clock when she was straightening her piles of stationery, of which the Christmas shoppers had made havoc, she looked up to see Tom four aisles away, talking to the third floorwalker, a pleasant genial fellow. Then the clock struck nine, the doors closed and the girls turned away to get their wraps. At the outer door, Tom, directed by the third floorwalker, stood waiting.

Laura had never guessed just how glad she would be to see someone from home. When they were outside and Tom placed her hand on his arm, it was just as if she had not been away at all.

"Let's walk!" Laura said eagerly when again they were outside in the cold bracing air. "I love to walk across the bridge at night. The water is so quiet 'way down below that it rests me. It's only six blocks and the cars are so crowded and stuffy."

She smiled reassuringly at Tom, who looked as if he had lost his only hope. The third floorwalker had given him a glowing description of her success. Tom felt that he had lost. She had not said that she would come back to him unless she were a failure

They stopped and looked down into the water. It was a quiet place, Tom thought, to tell her what he knew.

"The floorwalker"—Tom tried to speak lightly—"says you have made good."

Laura said nothing. She had not known before that she was successful. Was that making good? Standing back of a counter selling stationery all day, going home at night to soak your tired feet in hot water, getting up and going on the next day and the next and for endless days—was that success?

"It's all a lie, Tom!" she burst out. "I haven't made good! I—I'm a failure, after all! You know, Tom dear, failure's on the inside. 'Way down inside, I'm a failure. One kind of failure is where you try and fall down on your job. Another kind is where you make good but are miserable all the time you're doing it. That's the worst kind of failure and that's the kind I am. I—I don't love my work, Tom—I hate it!"

Tom took her in his arms.

"God bless my failure!" he said earnestly. "We're going home tomorrow."

SPARK PLUG WOULDN'T SPARK

My bonnie lies under the auto,
My bonnie swears under the car,
He can't get the engine to working
And so we must stay where we are.

He's sent to the garage for some one
To tow us to town before dark;
He can't get the spark plug to sparking
It simply refuses to spark.

—Ex

SAVING IN THE LAUNDRY

To save time and fuel on wash day put two wash boilers, instead of one on the stove. The same fire will heat two about as quickly as one, and you can wash one-half quicker, and with much less fuel. If you buy laundry soap, you will find that it pays to buy in as large quantities as your means will allow and let it dry out for several months before using.

To cure the soap remove the wrappers and allow to stand uncovered as long as desired. Then wrap again and put away.

To save time and strength when washing the dirty overalls and shirts that are worn by the men on the farm or to clean any very soiled garments, put them to soak in a little lye-water, then wash through the last suds. Place the goods smoothed out on the washboard and scrub with a stiff brush with a handle. This saves many a hard rub on the washboard, and it saves the hands, hurries the work and also saves the material.

To make good and cheap blueing at home, dissolve one ounce of Prussian blue and one-half ounce of oxalic acid in one quart of water.

To do a big washing with very little soap, put the fine white clothes to soak for several hours in warm suds made with dissolved borax soap chips and put the more soiled and heavier pieces to soak over night in warm suds made with the same solution. When ready to wash, a little soap rubbed on the most soiled places is all that is necessary. The summer net underwear and many soft pieces can be washed through the soap chip suds without using soap. This is the best way to wash white stockings as the soap chips make a very soft suds that loosens all soil in the fabric and all pieces are left a beautiful clear white.

To prevent mildew, see that all clothes are thoroughly dried before they are put in the clothes hamper, and it is worth while to take the trouble as mildew is hard to remove.—A. M. H.

RHUBARB, THE VERSATILE VEGETABLE

Baked Rhubarb Pudding

Three stalks of rhubarb, one cup of bread crumbs, one tablespoon of butter and sugar to taste. Wash and trim the rhubarb, cut in small pieces, fill a pudding dish about three parts full, adding sugar enough to sweeten the rhubarb. Put the sugar in the center of the fruit, not on the top. Mix crumbs with about two tablespoons of sugar and one teaspoon of powdered ginger, place them on the top of the rhubarb, dot with butter and bake in a hot oven for about half an hour. A layer of crumbs may be put into the dish first, then the rhubarb and bread crumbs on the top.

Rhubarb Pie

Wash and cut into inch pieces, but do not peel, as the skin gives a pretty pink color. Fill a deep dish with the fruit, sprinkle over it three tablespoons of flour, or half a cup of cracker crumbs, two tablespoons or butter and enough sugar to sweeten. Cover with a rich crust and bake half an hour, or until crust is brown. If preferred you may use half russet apples with the rhubarb or one-third seeded raisins chopped with the rhubarb.

Rhubarb Cream

Put through a sieve a generous three-fourths pint of cold stewed rhubarb and heat. Soak one-half box of gelatine in one-fourth pint of cold water 30 minutes, add one-fourth pint of the heated rhubarb and stir till the gelatine is dissolved. Then mix in the rest of the rhubarb, pour into a bowl and set in an outer one of ice water. As it begins to set, beat lightly and fold in one-half pint of whipped cream, and one-fourth pint each of candied cranberries and chopped nuts. Pour into a mold and when firm and cold turn out and garnish with candied cranberries.

Rhubarb Ice Cream.

For a gallon of ice cream or custard allow one quart of cooked thick strained rhubarb. Add to it when cold one quart of cream, plain or whipped, or one quart of prepared cooked custard. Flavor with orange or lemon and freeze.

Rhubarb Sauce

Cut and prepare with sugar, as for baking, but set the crock at the back of the stove where there is a slow fire and cook two hours. The pieplant may be put through a colander and then through a sieve and served cold like applesauce or with shortcake.

Stewed Rhubarb With Figs

Cut into inch lengths and place in a double boiler. Ordinarily allow no water but cook, as in baking rhubarb, where a very gentle fire will make the juice exude well to moisten and stew it. Add no sugar till clear and tender and then very little. Some of the best cooks, however, add both sugar and water when first placing on the stove, one-half pound of sugar and one-fourth pint of water for each pound of rhubarb. Serve sold. Soak figs until tender in hot water or steamed till plump and add to the rhubarb just before serving.

Rhubarb Biscuit

Roll out a sweet biscuit dough, spread with either uncooked rhubarb in inch pieces or with stewed rhubarb, butter, sugar and cinnamon. Roll up and bake, adding one-half cup of water to the dish. Bake till a golden brown. Serve with stewed rhubarb.

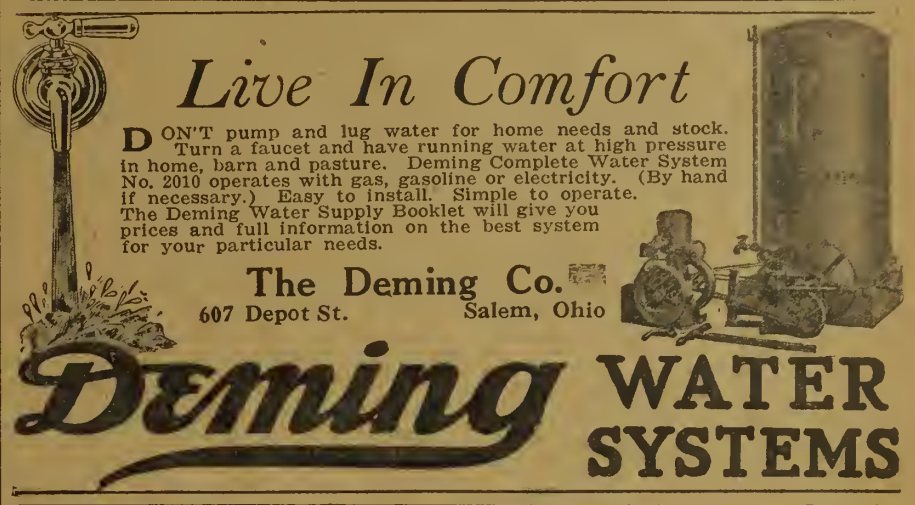
Rhubarb Puffs

One cup finely chopped rhubarb, one cup sugar, two tablespoons butter, one teaspoon baking powder, quarter of a cup milk, two eggs, sufficient flour to make thick batter. Cream butter and sugar, add well beaten eggs, milk, flour, rhubarb and baking powder. Half fill well greased cups and steam half an hour. Sauce—Cream together half a cup each of butter and powdered sugar, then add by degrees one beaten egg, beating until perfectly smooth. The last thing before serving stir in three tablespoons of boiling water.

Rhubarb Fritters

Cut some rhubarb into two-inch lengths and cook it in a thick syrup made of one pound of sugar and one pint of water. When tender remove from fire and leave rhubarb in syrup until cold. Drain; take a tablespoon in fritter batter and fry in a kettle of deep boiling fat. Drain and roll in sugar, and serve with rhubarb sauce or the syrup in which it was boiled, flavoring it with orange.

Letting warm water and a teaspoon of mustard stand a few minutes in the dish in which fish has been cooked will remove the odor.



Live In Comfort
DON'T pump and lug water for home needs and stock. Turn a faucet and have running water at high pressure in home, barn and pasture. Deming Complete Water System No. 2010 operates with gas, gasoline or electricity. (By hand if necessary.) Easy to install. Simple to operate. The Deming Water Supply Booklet will give you prices and full information on the best system for your particular needs.

LIVE STOCK

The market outlook with steers shows very weak condition. Good cows are steady with other grades slow. Hogs around 200 pounds are in active demand. Heavy hogs show very slow sale. Choice lambs are scarce and sales are made above following quotations. Common stock slow demand.

The following prices represent those paid by local killers f. o. b. Los Angeles. County point prices are usually $1.00 to $1.50 less than these figures, dependent upon the distance fro mthe city:

Good steers	10.00@10.50
Medium steers	8.50@9.50
Common steers	7.50@8.00
Good cows	7.50@8.50
Medium cows	6.50@7.00
Common cows	4.50@6.50
Hogs No. 1, 175-225 lbs.	18.00@19.00
Hogs No. 2, all other weights	17.00@17.50
Lambs No. 1, 55 to 75 lbs.	13.50@15.00
Lambs No. 2, 65 to 80 lbs.	11.50@13.00
Wethers	7.50@9.00
Ewes No. 1	6.50@7.00

POTATOES AND ONIONS

Demand and movement moderate, market firm.

Potatoes: Sales to jobbers: California, Burbanks, sacked per 100 lbs. sales from storage, best 2.00; new stock, sacked per 100 lbs., White Rose, 2.65@2.75.

No. 2 Wheat or Wheat and Oat hay	12.00@14.00
Choice Tame Oat hay	15.00@17.00
Other Tame Oat hay	12.00@14.00
Wild Oat hay	10.00@12.00
Barley hay	11.00@13.00
Alfalfa hay	14.00@16.00
Stock hay	9.00@11.00
No. 1 Barley straw, bale	.50@ .80

Citrus Markets

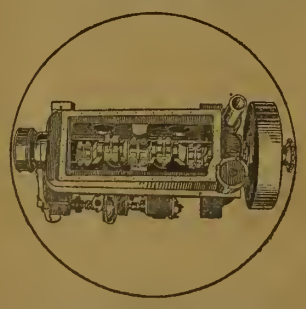
Los Angeles, July 9, 1919.

The orange market is in fair condition, good sound stock commanding satisfactory prices. There are still 7500 cars of Valencias yet to go.
The extremely hot weather has firmed up the lemon market and good prices are being received.

Shipments

Shipments of citrus fruits to date since November 1, 1918: Southern California; oranges 26,731 cars, lemons 7506,

The Lauson Wins Again: at Porterville, Cal.



The LAUSON-BEAVER 4-cylinder Kerosene Burning Engine develops 30% surplus power at a normal speed of 950 R. P. M.

Five well known tractors entered a competitive demonstration recently on the 100-acre orange ranch of Wight & Pfaffinger. Porterville, Cal., and the LAUSON was the *only* tractor able to pull three 14-inch mold board plows anywhere on the ranch. The LAUSON was purchased and is now in every day use.

Some of the grades on the ranch are as much as 20%; the ground is adobe soil intermixed with many large size rocks, presenting extremely difficult conditions. This is typical of LAUSON PERFORMANCE under all operating conditions.

New literature just off the press tells why the LAUSON is "*The Pattern Tractor of the Industry.*"

Philadelphia: 8 or., 3 lem. Val. 3.35-5.30, lem. 5.10-8.05, grapefruit 4.45.

MARKET NOTES

Green and wax beans are netting growers in the San Francisco truck growing district around 6 and 7 cents per pound.

R. G. Risser, federal truck crop specialist, says that cantaloupe shipments for the season have broken all records passing the 600 car mark the middle of the past week. Daily movement declining rapidly especially in the northern portion of the valley. Late crops grown on lettuce and pea land now supplying good stock and year's output expected to exceed 7000 cars unless present hot weather cuts down movement suddenly. There has been little loss this season from aphis and the crop has been handled with less waste than usual in spite of its great size. Root knot caused by nematodes has done serious damage in certain fields.

Green corn is coming in fair supply from Alameda and Contra Costa district. Growers ship to market in sacks containing about 10 dozen and obtain around 50 cents per dozen at packing shed.

Garlic crop is maturing in San Francisco district. Buyers are offering 16 cents per pound for first cars but growers are not selling yet. They are anticipating higher offers when stock is ready to ship.

Potato growers are holding off harvesting as long as possible on account of unsatisfactory market. Heaviest shipments were from the San Fernando Valley where crop is yielding about 6000 pounds per acre.

In the Stockton district early potatoes in small lots are being sacked for local shipments. Carloads will not be shipped in sacks before July 15.

Tomato outlook in Fullerton district is very good. Growers are still planting in San Francisco district. Imperial Valley about cleaned up. In Merced the Stone variety in more liberal supply, selling around $1.25 per 18 pound box. In Alameda and Contra Costa districts fields show excellent growth and vines full of blossoms and set fruits. These districts, however, will not furnish market before August 1.

CAN'T TELL AGE BY RATTLES

How old is a rattlesnake? It has always been a source of satisfaction to believe that a rattlesnake's age could be determined from its rattles. The very simplicity of the theory recommended it. What could be easier? A rattlesnake got a new ring on its rattle every year. Count the rings and you have his age. Now the scientists come along and explode the theory.

"When a rattlesnake is born it is provided with a small button at the tip of its tail. A few months after birth it sheds its skin. In two months more it sheds its skin a second time, and in so doing uncovers the first ring or segment of the rattle which has been developing under the epidermis. Therefore, every time it sheds its skin it uncovers a new segment. Under normal conditions, a rattlesnake sheds its skin three times a year, but unusual climatic or food conditions may vary the number of molts.

"The rattle is a rather delicate organ. The snake wears out the older rings dragging them around over rough, rocky ground. A rattle seldom attains a length of more than ten or eleven rings, as when that number has been acquired the vibration at the tip, when the organ is used, is so pronounced that additional segments are soon worn, broken and lost."—Alfred Westfall, Colorado Agricultural College.

THE CAR WAS ALL RIGHT

"I have a feeling that we ran over somebody back there. Hadn't we better stop and see?"

"What the use? The car is all right, I could tell in a minute if anything was out of order."

MACHINE MADE PIPE

The agricultural experiment station of the University of Arizona has issued Bulletin No. 86, "Machine Made Cement Pipe for Irrigation Systems and Other Purposes." There has been so much making of cement pipe of indifferent quality recently that it is in somewhat bad repute. Cement pipe can be made very satisfactorily, and the object of this bulletin is to discuss methods of greater permanency. The bulletin refers to the fact that many Arizona farmers still prefer the higher priced clay sewer tile and also that in California the use of the tamped cement pipe is increasing. The book gives a most complete treatment of machine and other methods of pipe manufacture; tables as to weight per foot; methods of reenforcing; analyses of material; methods of laying; effect of wetting, of temperature; tables showing pressure tests; in fact, a complete treatise on concrete pipe manufacture.

STRAWBERRIES UNDER IRRIGATION

Strawberries must have an ample supply of moisture, not only during the season of bearing fruit, but also throughout the growing season. For this reason irrigation is necessary to make the crop reasonably sure in most sections. Cultural methods for growing strawberries in the West are described in Farmers' Bulletin 1027, just published by the United States department of agriculture.

As strawberries have a shallow root system the surface soil must be kept moist and irrigation must be more frequent than for many plants whose roots penetrate the soil deeply. The number of irrigations will depend largely on the character and frequency of the tillage used in conserving moisture and on the type and condition of the soil. If the furrows are thoroughly cultivated as soon as the moisture conditions permit after each irrigation, the number of applications of water can be materially reduced, as compared with the number required when cultivation is neglected. In the lighter soils, during the bearing season, the fields may be irrigated as often as every four or six days, and in heavy soils every week or two. During the months when the plants are not fruiting only enough water to keep them in a thrifty growing condition is necessary.

GROWING OF SWEET POTATOES DISCUSSED

Irish potatoes as a commercial crop have a rapidly growing rival in sweet potatoes. Within the last 10 years the farm value of the latter crop in this country has doubled and now is second only to Irish potatoes in commercial importance. To assist growers who are not familiar with the culture and storage of sweet potatoes the United States department of agriculture has recently published Farmers' Bulletin 999, "Sweet Potato Growing," which discusses the subject from the preparation of the soil and growing of the plants to harvesting, storing, and marketing the crop.

Sweet potatoes can be grown under a wide range of conditions for home use, says the bulletin, but when they are to be produced commercially careful consideration should be given to the necessity of suitable soil, favorable climate, accessible market, ample transportation and proper storage. Storage is of great importance, for if the crop is improperly cured and stored it will decay rapidly and the whole year's work will be lost. But it is possible by improved methods to hold sweet potatoes for several months at practically no loss.

This crop is propagated by plants produced by sprouting sweet potatoes in warm sand. Potatoes from which the plants are to be grown should be planted in early spring in hotbeds. In the South, where no bottom heat is necessary, cold frames may be used successfully. Good plants are necessary for a successful crop, for a big harvest depends largely upon the way the plants start off after being removed from the plant bed and set in the field or garden.

ONE THING SURE

A colored boy was taken in the draft last fall and sent to Camp Grant. After a few weeks, he became very homesick, never having been away from home, and one dark night, decided to visit his home without leave. All went well until he neared the outskirts of the camp, when the sentry accosted him thus:

"Halt there, where you goin?"

"Ahm going to Chicago."

"Have you got a pass?"

"No Sah, I haven't."

"You can't leave this camp without a pass."

"Looka heah, boy; I'se got a mother above, and father down below, and a sweetheart in Chicago; an' I know I'se goin' to see one of them three before this night is over."

Any kind of a numskull can be waited on; it takes skill, patience, good judgment, industry and tact to serve.

Borrowing Money On Real Estate

Borrowing money on real estate from a strong, well managed institution like ours, created to transact a mortgage business exclusively, is preferable.

Here are some of the advantages:

—You can deal with this company directly without having to pay a brokerage or commission of any kind.

—You can always borrow at the lowest current rate.

—You can keep the money borrowed as long as you want it—provided your security remains good.

—You can secure releases or pay your loan at any time by paying a small bonus.

—You are under no obligations as this company appreciates your business.

—First mortgage loans are made on improved and productive city or country property as follows:

Business property.
Residence property
Dairy and stock farms.
Alfalfa ranches.
Citrus groves.
Vineyards in raisin district.
Fig and walnut orchards.
Deciduous fruit ranches.
Berry farms and truck gardens.
Choice cattle ranches.

G-E Motors in the Dairy

No more muscle-straining from a jolting, bumping churn: no more tiresome arm-and-shoulder movement over the separator. Just a turn of the switch and off they go, driven by G-E motors.

There is a G-E Farm Motor suited in size, speed and control to every farm or dairy operation. A man at your lighting company who is experienced in such power problems will help you on yours—or write to our nearest office.

General Electric Company

General Office: Schenectady, N.Y.

A full water tank the year round

ECLIPSE

$1.65 a year

IT'S a mighty still day when the ECLIPSE WOOD WINDMILL does not pump water into your tank. The ECLIPSE is sensitive to light breezes—pumps when other mills stand still.

Powerful, superior construction. Some ECLIPSE WINDMILLS erected 38 years ago are still pumping—without repair expense. Figured on this basis the ECLIPSE delivers a reliable water supply at a cost of about $1.65 a year, the cheapest possible.

The ECLIPSE is time-tried, solidly constructed, and powerful. Requires little attention, and no repairs.

Have your dealer tell you the complete story of the ECLIPSE.

Big Sister to the American Doughboys

There were 2500 of these big sisters, girls who donned the uniform of the Y. M. C. A., landed in France to brave hunger, fatigue, exposure and shell fire, just for the sake of "doing something for the boys." Some were girls, some were gray-haired mothers, but all knew and loved that specimen of the human race, the American boy, and all went over to dedicate themselves to that boy's happiness and welfare.

The "Y" woman earned first place in the soldier's heart by being to him anything he wanted. If he were depressed, she cheered him; she was always a jolly sort, and good fun. If he were elated she helped him celebrate. If he wanted to talk, she became an ear. If he wanted something to eat, she could always rustle it for him. If he wanted a word of sympathy or advice, she gave it.

OUR ADVERTISERS RELIABLE
We guarantee our subscribers against loss through dishonesty of any advertisers in the Cultivator. We do not attempt, however, to adjust trifling differences between subscribers and honest, responsible advertisers, nor will we pay the debts of honest bankrupts. Notice of complaint must be sent us within 30 days from date of the transaction, and the subscriber must have mentioned the Cultivator when writing the advertiser.

THIS WEEK'S COVER

A drawing of one of the finest of America, the Y. M. C. A. woman, takes honor place on the cover this issue. The comforts of home cannot follow our boys when they go to war, but so far as possible the American people send of their money and their best people that the boys may at least have sufficient to remind them of the comforts when they do come home again. One of the greatest factors in America's success was the Y. M. C. A.

FOLLOWING CALIFORNIA

The college of agriculture at Cornell, New York, is recommending to farmers of that state the study of California cooperative methods. California fruit growers have shown to the world by far the greatest cooperative success of any producing section of the world.

"STANDARD OIL"

The Associated Advertising Clubs of the World is giving warning as to "Standard Oil Company of Texas." The words, "Standard Oil", are to conjure with, and it is asserted by a circular from the Associated Clubs: "This company is in no way connected with the original Standard Oil group." The unwary investor may well keep in mind the warning given and make thorough investigation before purchasing Standard Oil of Texas

DAYLIGHT SAVING

We spoke recently of the passage of the bill by the federal congress repealing the daylight saving act. This was to take effect next October. Now comes the veto of President Wilson, and the farming sections of the United States are in arms and the people of the cities generaly pleased at the result. An effort has been made in the house to pass the bill over the veto of the President, but this was voted down, and presumably the daylight saving law will stand so far as this session of congress is concerned.

BE CAREFUL OF FIRES

The California legislature passed Assembly Bill 445, an act to amend Section 384 of the Penal Code regarding prevention of fires. It is very stringent in its provisions and the punishment is severe to whomever "sets or causes fire to be set to any forest, brush or other inflammable vegetation." Under this law severe fines may be imposed for using any locomotive or engine in a section where there is danger of setting fires, without adequate devices to prevent escape of fires or sparks or burning carbon. Likewise, any one operating a harvester, header, stationary thresher or hay baler shall at all times keep in convenient place upon each said harvester, etc., suitable chemical fire extinguishers, each with equipment of not less than two and a half gallons. Operators of tractors, engines, harvesters, etc., should post themselves fully as to provisions of Assembly Bill 445.

EAT MEAT

Choice and prime beef steers are gradually lowering in price. The department of agriculture takes the position that they will continue to lower unless the American beef consumer ceases to follow the former patriotic appeal; "Eat less meat." The war is over; the boys are coming home; the government is buying no meat for overseas, and England and Italy are making most of their purchases in South America. Hence the department's appeal to the consumer to eat more meat, especially beef and mutton; pork is still in good demand by European consumers, and the United States is the only producer of surplus pork at this moment.

But the consumer comes back with the plea for cheaper meat before he can buy more liberally, and here is the joker in the present beef and mutton situation:

Between March 1 and July 1 medium and good beef steers on foot in Chicago declined 14 per cent; choice and prime declined 23 per cent; likewise wholesale prices of medium and good carcasses showed in Boston, New York and Chicago a decline of 28 and 29 per cent and in most other cities a decline of 23 or 24 per cent. On the other hand retail prices in several cities showed an increase as great as 25 per cent, which was on round steak in the city of St. Paul. The city of Washington showed an increase of 20 per cent; Pittsburg, ten per cent; Philadelphia, three per cent. Slight declines were noted, for instance round steak in Chicago declined eight per cent and in other cities declined from nothing to 20 per cent, but in no case has the decline been equal to the decline of beef on foot.

It's a case for discussing federal supervision, likewise state and municipal laws, for if something is not done there will be serious injury to the live stock industry. Federal supervision of packing plants might be one step in the right direction, but entire government control as with the railroads will be met by rebellion on the part of the people. The people do not want a political farce but relief from extortion. Meantime the beef producer is confronted by the necessity of continuing to feed or sell at a loss.

PHILIPPINE AGRICULTURE

It was recently our pleasure to have a few minutes conversation with Mr. Silverio Apostol, chief of the plant industry division, bureau of plant industry, Philippine Islands. Mr. Apostol is in America studying agriculture in general, but more particularly giving attention to the rice industry. He has investigated conditions and methods of culture in the Sacramento Valley and is now in Coachella and Imperial Valleys learning as to cotton conditions.

The Philippines produce largely of rice, but not sufficient for the entire home supply. While agriculture in general in the Philippines has greatly advanced since American control rice culture is much the same as it has been for generations. The paddies are generally exceptionally small and the power for practically all the operations in rice farming is furnished by the water buffalo, or caraba. As to why the American mule is not used, especially in view of the fact that the losses of cattle from rhinderpest are very great, Mr. Apostol said that it was not possible because the mule or American horse would not stand up under climatic conditions and the fact that much of the work is done on lands covered by water. The seed is not drilled in as in this country but is planted by hand, or rather replanted after it has been grown in seed beds to the height of five or six inches. The replanting is done in soil which is partially covered by water.

Mr. Apostol will spend two years on this trip, much of the time in America, later leaving for the Philippines by the way of Europe and southern Asia.

SELLING FARM PRODUCE

Compared with some other states California producers have a great advantage in this, that our state laws permit of collective or cooperative marketing. These laws permit organization of non-profit associations which have, for the purposes of marketing, all the power which may be secured by the organization of the ordinary stock corporation. These corporations are recognized by federal enactment and to a degree secure immunity from the operation of the Sherman anti-trust law, but even in this state cooperative marketing organizations have used the utmost care that there should be no technical violation of the provisions of the federal anti-trust laws. This has necessitated employing attorneys of ability whose duty has been to outline legal steps necessary to insure observing the letter and the spirit of the federal law.

For these other states where these would-be cooperators are not situated so that they can market collectively there is a measure before congress which will not, if enacted, change the policy of the government as to large corporate interests but will permit collective marketing by producers. At the present moment in both Illinois and New York cooperative organizations of milk producers are under investigation by federal district attorneys. The assumption is that these investigations are to lay the foundation for indictments charging acts in violation of federal anti-trust laws. This situation is preventing the farm associations in those states from securing full advantage of their cooperative organization.

The National Board of Farm Organizations is taking up the fight and endeavoring to secure an amendment to the Clayton act. The particular section sought to be amended provides that only associations having no capital stock may be exempted from the provisions of the act. If the amendment is passed organized dairymen or other producers will have liberty of action under the anti-trust law and can protect themselves from losses and in a large way encourage greater production.

While Californians will not be so greatly benefited as producers in other sections of the United States, they may well encourage its passage, and in doing that encourage a greater cooperative effort on the part of all producers.

Secretary Chas. A. Lyman of the National Board recommends that all who would encourage this beneficial legislation write Congressman Andrew J. Volstead, chairman of the Judiciary Committee, House of Representatives

AUTO GRAPHS

The most welcome sign on the trip was that in the office of one of hotels: "Plunge in Basement. Free to Guests." If there is anything which makes a plunge feel good it's an all-day, mid-summer ride in the San Joaquin Valley.

* * *

Though I am reminded that there was one feature which looked better than a plunge in the basement of a hotel, and that was the Kings River. We were told the water was short because of limited rainfall of the past season, but a look into its depths from the bridge developed a bunch of carp and other fish nearly as long as one's arm. The water, clear as crystal, looked more like the old swimming hole than did the concrete tank.

* * *

But speaking of water we are reminded of the continuous put-put-put heard in every part of the valley. I remarked to Mr. Thomas that with all this "coughing" there would necessarily be a lot of consumption, and he came back with "Yes, and every time they cough they raise a little."

* * *

More correctly, they raise a lot as was indicated by immense fields of green alfalfa, and there is no more beautiful green on earth than alfalfa green.

* * *

Here and there on siding a flat car with tractor indicated that some of the tractor people have been doing the valley and extending efficient power farming.

* * *

At Tulare the street for an entire block roped off, in the center of the enclosure a platform with piano, apparently preparation for a street dance. A few hours later the dance materialized, and people must have come from miles to do their Saturday evening trading and enjoy a bit of recreation.

* * *

One novel feature of a trip through the state is the big sign often located at the entrance of towns, advertising tires. We need not necessarily mention the make of tire, but we may refer to the opposite side of the great book which contains the history of the United States. Plainly, to read the entire edition one would have to travel a great many thousand miles, for the history contents itself with a few pungent sentences touching upon the "history of the town you are now entering." A decidedly unselfish stunt, for it is noted that every one of these great bulletin boards gave vastly more words to the history of the town than to description of the company's wares. Notwithstanding this, it is good advertising.

* * *

Then Lottie Miles took her pointer and informed us that we were now at ———, with a map of the entire section showing all of the good roads traced out on an immense bulletin board. More valuable information, hence good advertising.

* * *

This reminds me that some of the most interesting reading matter in this world is that appearing in the advertising columns of Tho California Cultivator.

* * *

The best of an auto trip overland is the information one secures as to the immense amount of real constructive work now going on in California. But once on this trip we saw the reverse. It was a gold dredger engaged in destroying hundreds of acres of good agricultural land in order to secure the gold dust lying down next to hard pan. We need gold to conduct the business of the world, but we fear the time may come when the world will wish most cordially that we of this generation had regarded with more consideration the bread producing power of these lands which we are destroying.

The Maxwell Plan

By M. E. Bemis

YEARS ago when it was beginning to be apparent that the land area under the canals in the Salt River Valley of Arizona was too great for the available water supply in the dry years, there was one man who persistently advocated a storage reservoir. He was one of those with a vision, a dreamer, if you please, who could look forward into the future and see the possibilities of an ample water supply for the Salt River Valley.

Years later when the Roosevelt Dam was built and people could see the realization of his dream, one of the editors of a daily paper said of him that he was the only man he ever knew who sought to find the pot of gold at the foot of the rainbow and found it. This man is George H. Maxwell. This is the man of whom it is sometimes said that no matter upon what subject he speaks, you need to carry an umbrella and wear gum boots, because sooner or later in his talk he gets around to the subject of irrigation.

The Roosevelt Dam is no longer a dream; it is a reality. Two hundred thousand acres of land are irrigated from the reservoir which this dam has made. Seventy thousand people have found homes in the valley, which was once a desert, but which now is as productive as any spot in the world. The total value of crops produced is more than $20,000,000 a year. To this can be added $5,000,000 for the live stock and live stock products raised on this area.

Maxwell did indeed find the pot of gold at the foot of the rainbow, but now there is still another rainbow, and he has succeeded in convincing many level-headed men that there is a pot of gold at the foot of this rainbow as well.

The plan, which is a broad one and not fully worked out in detail, is to bring under irrigation every foot of land possible within the state of Arizona. Of course it is not altogether new, but any previous plans for irrigation projects have been local and have not taken into consideration the relation of these projects to any other project which might possibly be contemplated in the future, and only so far as was necessary according to law and established rulings have they taken into consideration projects already established.

The new Maxwell plan contemplates the development of land beginning on the Upper Gila, and with thorough investigation of each and every project on this river, together with surveys which will settle without question the practicability of each proposed project. They would gradually work out the best location for storage reservoirs and the land to which the waters from these reservoirs could be supplied in such a way as to irrigate most land at the least cost. Beginning again on the Colorado River, the plan calls for a gigantic dam at the 1000 foot contour which would permit the building of a canal high enough to water 1,000,000 acres and to provide storage capacity for not only this but all that would be required in the Imperial Valley and other projects now receiving water from the Colorado. This will develop power, the gross value of which would be at least $1,000,000 annually.

In addition there would be the development of storage underground water to be located by surveys, and careful calculations indicate that this, together with the conservation of the water of the Salt River and Verde River would result in increasing the area of irrigated land in the Salt River to 600,000 acres. The total area of land which he believes could be irrigated through a broad plan of this kind is two million acres. In order to get this plan into working order a committee is proposed one from each project and one from each civic organization throughout the state. This committee will take up in detail each proposed irrigation project. They will require surveys to be made for the establishment of storage reservoirs and for the location of underground water supplies. All data compiled will then be considered, and with the one thought in view of the greatest possible development for the Southwest they will recommend the establishment of storage reservoirs and building of canals which will accomplish these things.

It is probable that the next legislature will be asked to authorize a bond election to cover the cost of putting these plans into effect. The cost of such a project is estimated to be $100,000,000, a sum that a few years ago would have staggered the public. Today, however, looking backward to the expense of the war, which amounted to $100,000,000 daily, the expenditure of this sum, which would bring into cultivation 2,000,000 acres of land producing crops worth $200,000,000 annually, does not seem an insane idea.

For the coming generation we must look to the desert and the swamps of America for the farms of the future, and the need of more farms and more farmers is becoming greater with each succeeding year. It is only by broad comprehensive plans of this kind that more agricultural land can be made possible.

Is Cooperation Worth While?

THE strength of any cooperative organization lies in the intelligence and integrity of its members. As indicated in the following article by Wylie M. Giffen by far the greater majority of the members of the California Associated Raisin Company are men of intelligence and integrity. Presumably such is the case with the majority of the cooperative associations. It is the case with all that are succeeding, for unless the management knows that it has behind it staunch and true supporters it cannot have faith in its own promises, nor can it build nor make plans for the years' business. Fortunately this lesson has been learned by most producers who have formed cooperative associations, and they have builded accordingly. For the members who lack the true qualifications of cooperators there are clauses in contracts which legally bind them to the performance of their duties.

But with the Raisin Growers' Association—and it is not an exception—there has been effort put forth to discredit the association and discourage its members. This has called forth a very forceful, frank and square statement from the manager of the association. The questions involved concern all cooperators and they are so forcefully stated by Mr. Giffen that we give his entire communication recently appearing in the Sun-Maid Herald.

By Wylie M. Giffen

One of the great benefits to be accomplished by this organization was the elimination of speculation, and in line with that policy the board of directors, sometime ago, decided that the prices of the 1919 crop would not be named until sometime during the month of August. At that time we can tell better what the crop is going to amount to, and we can come nearer judging of the consumer demand and of financial conditions. The raisins cannot be moved until September and October and as we see it there is absolutely nothing to be gained by naming the prices at the present time. We believed also that it was the better policy not only to refrain from naming the prices but to come to no decision and to give no intimations as to what the prices would be until such time as we could act intelligently, but some of our competitors have been so persistent in preaching the gospel of discord and trying to persuade the growers to violate their contracts with us that we now deem it advisable insofar as we can to allay their misapprehensions.

We, of course, do not yet know what the prices will be, but there seems to be no reason now, in spite of the fact that we will harvest the biggest crop in the history of the business, why the prices should not be much more than last year, and yet one of our competitors is busy showing the growers what he claims to be a copy of a circular sent out to the trade by this office under date of May 24, to the effect that 1919 prices would be no higher than 1918 prices and as their prices were four cents higher the grower could pay the $40 per ton indemnity provided for in our contract and be ahead $40 per ton.

In regard to this mysterious circular we can only say that if it is in existence it was not prepared and sent out by this office. In fact no circular, under date of May 24 in regard to the 1919 crop or any other subject, has been sent out. Further than this there has been no circular sent out at any time that in any way furnishes a foundation for this false report. We have gone over the circulars of our sales department carefully and there is not a single circular that in any way indicates that the prices of 1919 raisins will not be higher than the prices of 1918 raisins. In fact this supposed circular reads so much like the circulars that were sent out by our competitors in the good old days when raisins were 1 1-2 cents per pound that we cannot help but believe that their filing clerk has made a mistake and gotten hold of one of their own circulars. At least the packer who is using it was prominently identified with the number who disregarded absolutely the law of supply and demand in the old days, and sold the growers' crops before the bloom was on the vines for much less than the cost of production, and under these circumstances we believe that as growers you are justified in at least waiting to see what the prices of your own organization are going to be, and it is the judgment of the writer that if you regard your honor so lightly as to desire to violate your contract that you will be able to get at least as much money from the outside packers then as now. A few growers whose minds have been poisoned by this propaganda have come to the office to see whether they could not pay us $40 per ton and sell elsewhere. Our answer to this is that under no conditions will we voluntarily agree to the release of any crop. The keystone of an organization of this kind is the honor of the growers. We could not permanently exist without it. Any policy that we may adopt must apply to every grower alike, and if we are to voluntarily release the grower's crop by the payment by him to us of $40 per ton then this should be made a general policy that would apply to every grower alike, and if every grower availed himself of this opportunity to pay us $40 per ton in liquidated damages we would be able to pay the stockholders a good dividend but would be out of business and our usefulness destroyed for all time. As we have already sold at a price to be named later a large percentage of this crop these contracts could not be filled and our written pledge would be worth less than a scrap of paper in the hands of the Huns. However, we have learned by six years' experience that even under the stress of a great temptation at least 98 per cent of the growers are honorable. Thus far there have been but few violations of the contract and we cannot believe that in this, the moment of our greatest prosperity, the growers are going to sacrifice the principles which have made possible the upbuilding of one of the greatest producers' organizations in the world.

It is not the purpose of this article to hold out a hope to the growers that the prices of the association will be as much or more than is now being offered by the independent packers for the few crops that still remain unsold. As we understand our duty it is to sell the entire crop of raisins for the most money that we can possibly get and it is not to try and run a race with the packers to see who can buy and sell a few crops for the highest price, and while our prices may not equal 10 cents per pound, we do believe that what has always been true will be true again and that our price will be more than the average price of the outside growers. A large percentage of the outside growers sold their crops at about six cents per pound, which we all believed at that time to be a good price. There are probably not over two per cent of

Continued on Page 75

Agricultural News Notes of the Pacific Coast

Northern California

Pears are beginning to move in carlots.

Butte County has 150 acres of broom corn on one ranch.

Haywards, Alameda County, is planning for a farm products show.

Corning, Tehama County, reports exceptionally big crop of almonds.

The Haywards Review reports one sale of apricots on tree at $125 per ton.

Recently flooded areas in Sutter County were badly infested with grasshoppers.

The cannery at Corning has a large force of women and children cutting apricots.

Heavy shipments of plums are being made from Suisun, Vacaville and Newcastle.

The California Industries and Land Show will be held in San Francisco October 4-19.

Commissioner Fred Brosius of Sacramento County reports 156,000 trees planted this season.

Canneries are said to be paying $85 a ton for pears in the Lodi and Sacramento districts.

At the recent annual election of the Yuba County farm bureau Cline Bull was elected president.

Modoc County has intensive squirrel campaign under direction of Commissioner Thomas Briles.

The Sacramento Valley has increased its rice acreage over that of 1918 by nearly 25,000 acres.

Eden township in Alameda County is planning a farm products show to be held is the near future.

Martinez chamber of commerce will hold the Contra Costa County Land and Stock show October 6-12.

A new fruit dryer is being erected in North Secramento. It is primarily intended to handle wine grapes.

Concerted fight by all farmers in the Bogue district of Sutter County is being made against grasshoppers.

Butte County's crop of apricots is even larger than anticipated. The hot days caused early harvesting.

Yuba County is sending rice to Korea for seed, for which it is receiving 18 cents above government price.

Plans are being made to ship hundreds of tons of dried wine grapes to other countries for making into wine.

The board of supervisors of Butte County has approved the petition for the formation of the Wyandotte irrigation district.

Larger shipments than ever before are being made to apricot canneries this season from the Vacaville district of Solano County.

Glenn and Colusa Counties are holding meetings looking towards the bringing of 103,000 acres of land under irrigation and more intensive culture.

The board of supervisors of Butte County has appropriated funds for the support of the work of the county adviser for the coming year, but the proposal to employ an assistant adviser was turned down.

At a recent meeting of the Durham Almond Growers Association, it was decided to pay $4 a day during the present season to all male labor for nine hours. Women were voted $2.50 per day for eight hours of work.

Central California

Ceres, Stanislaus County, reports sales of Tuscan Clings at $81.

A Porterville fig grower has sold his crop at nine cents per pound.

Fowler, Fresno County, is building a new fresh fruit packing house.

Kings River is at the lowest stage it has been for 24 years this date.

The eight-hour day will prevail in many fruit growing sections of the valley.

The Associated Dairymen of California have issued bonds to the extent of $180,000.

Johnson grass pasture resulted in the death of several cows at Hanford, Kings County.

The increased acreage campaign is on with the California Prune and Apricot Growers Inc.

Quinces and pears near Porterville, Tulare County, have been seriously injured by fire blight.

Stanislaus County is busy harvesting earlier crops and fitting ground for second crops of the season.

The Mariposa-Big Tree road, on which government surveyors are now working, will run through the apple belt.

The California Farm Bureau Marketing Association recently sold Stanislaus County hogs at the top price of $17.60.

Prune growers of the Santa Clara Valley have installed evaporators or fruit dryers in order to be independent of the weather.

The Ahwanee Valley center of Madera County is planning to hold a big fair in September, at which the stock exhibit is expected to be the leading feature.

The farm bureau of Kerman, Fresno County, is discussing advisability of cooperating with the California Fruit Growers' Association in the building of a community camp for laborers.

The Merced County farm bureau, at its last meeting, made formal protest against nonpayment of dockage loss for oats and other foreign grains which millers find in wheat or barley, and which they sell as a byproduct.

Leroy B. Smith, who has been farm adviser of Fresno County, has been appointed supervisor of farm advisers of the southern half of California. Mr. Smith will continue his duties in Fresno County until the appointment of his successor.

A carload of wool sent to Boston by sheepmen of Stanislaus and Merced Counties brought only 30 cents per pound. It is reported the growers had refused an offer of 45 cents from a local concern expecting to get a good price in the East.

A half car of plums was condemned at Fresno by Horticultural Commissioner Roullard acting under the fresh fruit standardization law. The fruit was small at the bottom and faced with large sizes. It was allowed to be repacked and shipped.

There was a meeting of packers and growers of Stanislaus County the last of June to discuss standardization laws governing cantaloupe pack. The meeting was attended by G. P. Wilson, chief secretary of the state standardization department, and A. S. Hoyt, secretary of the state horticultural department.

Southern California

The apricot crop of Ventura County is expected to amount to 400 dried tons.

Pomona will be the site of a new state institution known as the Pacific Colony.

Imperial Valley will hold a live stock fair sometime during the coming fall.

Cotton acreage in the Imperial Valley is ten per cent greater than last year.

Cucamonga, San Bernardino County, wine grapes have been contracted for at $25 per ton.

The Apple Valley district near Victorville has organized a unit of the county farm bureau.

The Anaheim Sugar Company will manufacture and introduce a new product, orange syrup.

Letters may now be sent to any part of the United States for two cents, post cards for one cent.

A summer course for teachers in agriculture is being given at the citrus experiment station at Riverside.

Two carloads of pure bred Holsteins have been received by dairymen near Arlington, Riverside County.

The Elsinore and Temecula sections are investigating and find that the best of sugar beets can be grown there.

Nearly 7000 cars of cantaloupes have been shipped out of Imperial Valley this season. Last season's output was 4094; 1917, 3148.

The farm bureau of Fallbrook, San Diego County, held a meeting July 1 on the Myers ranch. Irrigation of citrus tres was demonstrated.

The federal labor bureau of Imperial Valley at El Centro reports a shortage of men to satisfy the demands on every day during the past month.

Sawtelle and Inglewood, Los Angeles County, have organized Lima bean growers into an association which will affiliate with the Lima Bean Growers' Association.

Drainage experts from the University of California have been making a survey of the Garden Grove district, Orange County, to find what will be necessary to install a drainage system.

Dr. Whitten of the state university has been delivering talks on orchard pruning with especial reference to summer work in the orchards, before farm bureaus of several southern counties.

Heavy shipments of cantaloupes to eastern markets are said to have seriously affected the sale of Valencia oranges. Packers therefore are holding up orange shipments until the cantaloupes are off the market.

J. F. Warner of Brawley has been elected president of the Imperial Valley Poultry Raisers' Association. The association will first devote its time to cooperative buying of feed supplies, later to marketing and advertising.

Apricot growers of the Fillmore district of Ventura County have decided on a wage scale of $3.50 per day for a nine hour day for field workers. For pitters 17½ cents per box is to be paid for the entire season's work. Where the worker does not remain throughout the season the price will be 15 cents.

The Coast and General

Union County, Oregon, held its annual livestock show at Union, June 11-13.

The beet fields in the lower part of the Yakima district of Washington are being seriously affected by blight.

Klamath County, Oregon, is planning for its county fair which will be held at Kilgore Lane, opening October 2.

Washington dairymen, who are members of the Inland Empire Dairy Producers' Association, are laying plans to distribute their own milk in Spokane.

Pima County, Arizona, is to follow the example set by Maricopa County and has called a bond election for the building of paved roads at a value of $1,500,000.

A new 20 stand gin plant is being built in Phoenix and will be ready for operation by September 15. This will be the largest gin in the Salt River Valley of Arizona.

Chehalis and Centralia, Washington, are becoming the centers of a large berry industry. Strawberries, loganberries, raspberries and blackberries have proved equally successful.

The cabbage worm is said to be doing serious damage to crops in Hawaii. The California state insectary has shipped a quantity of parasites to aid the Hawaiian growers in their fight against the pest.

At the suggestion of the forest service in Arizona, the state land board has relinquished to the federal government all state school lands within the forest reserves. This will amount to 6,322 acres.

The first farm settlement unit in Oregon is a 60-acre plot near Independence. Four other sites will he selected in the state. Two farms will be in eastern Oregon, one on the coast, one in southern Oregon.

The land law passed by the last legislature, permitting the state land commission in its discretion to lease land in larger tracts than 640 acres, has become effective. An effort to invoke the referendum against it failed.

Two representatives of the United States bureau of markets are located in Phoenix, Arizona, during the cantaloupe season to give out market information and assist the distributors in placing their products in the best markets.

The Salt River Valley Water Users' Association is making plans for the extension of the electric lines throughout the irrigated districts of the valley, so that ranchers of the valley may be supplied with electricity for power and lighting.

The county highway commission of Maricopa County, Arizona, has filed an application for $578,590 for federal aid on the roads of Maricopa County. This will supplement the $1,000,000 which will be expended by the county for the building of 274 miles of paved roads.

Summer rains in Arizona have begun. Showers have occurred in the southern part of the state and also in Navajo County. The general condition of livestock on the ranges is good, and sufficient water for stock purposes is reported to be in most of the range country.

Fighting the Walnut Aphis

By Robert W. Hodgson

AMONG the most notable developments in the field of economic entomology in recent years must be counted the new dust spraying method for controlling the ravages of the walnut aphis, as worked out by Professor Ralph E. Smith of the state college of agriculture. The results of the present season's work have clearly indicated that with the new method it is now possible to effectively control this pest and at less than half the cost with the old method of liquid spraying. Moreover, the dust spraying method developed for combating the aphis promises to lend itself very readily to the control of similar pests of other orchard trees and therefore apparently marks a new era in orchard pest control in California.

While the aphis has always been a pest of walnuts in this state, until comparatively recent years it was deemed of little importance. Nor was any other pest, for that matter, with the exception of blight, considered of sufficient importance to arouse any anxiety. In fact, the growing of walnuts, provided the trees were located on good soil, was considered as attended by less risk and expense than almost any other branch of horticultural effort. Although still recognized as comparatively free from serious pests and diseases, there are many who now realize that this attitude of false security has worked serious injury to the walnut industry in general. For to it must be attributed the general lack of care and attention given the orchards and particularly interest in combating injurious pests which have existed in many sections until within the last year or two.

It has taken the advent of a new walnut pest in the form of a strain of codlin moth entirely distinguishable from the ordinary pest of apples and pears, but which has developed a taste for walnuts, to bring home to growers in general the realization that the industry has now reached the stage when its existence as a profitable branch of horticultural effort depends upon systematic campaigns for control or eradication against not only the new menace but all the old and less serious ones as well. And in this renewed interest in walnut pest control fighting the aphis naturally assumes an important place.

Another contributing reason for renewed interest in aphis control is the feeling on the part of growers that of recent years aphis infestation has been much more general and serious than it used to be. Many of the older growers are certain that eight or ten years ago there was much less aphis than there is at the present time. Then, too, growers are beginning to realize that any considerable amount of aphis working on the trees at the time they are carrying the developing nuts, and particularly if especially abundant, must result in a material injury to the trees, not only in a general enervating effect but probably also in a reduction in size and weight of the nuts. To be sure, there are still some who insist that the aphis does little injury other than the topburn which follows the production of large amounts of honey-dew, but a rapidly increasing number of the more progressive growers and experts are of the opinion that large annual losses result from the work of aphis. While on account of the many factors involved it will be extremely difficult to actually determine the loss per acre, such experts as Professor Smith, probably the best informed walnut investigator in the state, and Carlyle Thorpe, manager of the Walnut Growers' Association, and one of the largest growers, feel that a safe estimate of the reduction in crop per acre occasioned by an average infestation is from 75 to 100 pounds of nuts. At present prices this would represent a loss of in the neighborhood of $15 per acre. And not only do they believe the crop to be reduced in weight, but that a severe aphis infestation materially weakens the trees, preventing them from entering the next season in as vigorous and thrifty condition as desirable. There is also a feeling that not only does aphis infestation result in a general devitalization and reduction in weight in the nuts, but also increases the per cent of perforation and number of "blanks." Mr. Thorpe in a recent talk on the subject candidly stated that in his opinion aphis annually causes a loss of half a million dollars to California walnut growers. He even went farther and prophesied that within but a few years growers everywhere would count aphis control measures just as important as irrigation or any other cultural operation.

Demonstrating Aphis Control

In action. Notice how the dust is thrown out in clouds. Recent demonstration under auspices of the Los Angeles County farm bureau. Professor R. E. Smith, supervising demonstration, is standing on rear of platform.

The Old Method

In the past, where control measures for the walnut aphis have been attempted, the only method available has been liquid spraying with nicotine sulphur of approximately the same strength as that used for spraying citrus and other crops for this pest. While if properly applied, the results obtained were entirely satisfactory, the per cent of kill being very high, there are a number of serious drawbacks to this method. In the first place the cost is almost prohibitive, averaging approximately 50 cents per tree. And not only is the cost high, but it is impossible to get over an orchard quickly without the use of a number of spray rigs working at the same time. From five to ten acres, depending on the size of the trees, is about all that a spray rig and two men can cover in a day's work. Minor drawbacks are the difficulties in covering such large trees as old walnut trees and the rather disagreeable nature of the work. On account of these two latter, in some sections it has been almost impossible to get commercial sprayers to spray walnut trees for aphis.

The New Method

The new method involves the use of a dry dusting mixture blown onto the trees by means of a powder duster. The standard machine used at the present time is the dust sprayer run by a three-horse gasoline engine. The duster itself is simply a centrifugal air-blower which is so geared up that when properly adjusted it delivers a cloud of dust which completely envelops the tree so that every leaf is covered.

The outfit is usually set up on a sled or low lying wagon bed pulled either by a team or tractor, and the jet is directed from underneath the carriage, being kept constantly moving, both sides of the row being dusted. Two men only are required, one to drive and the other to handle the nozzle. From 20 to 40 acres a day can be dusted by one outfit, depending upon the size of the trees and the way in which the rig is set up.

The material used at the present time consists of 74 per cent kaolin, 24 per cent hydrated lime, and two per cent nicotine sulphate. The latter is the killing agent, the other ingredients serving as carriers. For several years past Professor Smith has been convinced that the power blower was the solution to the high cost of covering such large trees as walnuts, but the main difficulty has been to obtain a satisfactory dusting material. This material must run uniform in composition, must be thoroughly mixed, must not be injurious under extraordinary weather conditions, and still must be cheap. Various combinations were tried before the present entirely satisfactory material was developed. Mixtures of hydrated lime, sulphur and tobacco dust in various strengths were used and with varying results. It soon became evident that the sulphur must be discarded on account of burning. Equal parts of kaolin, lime and tobacco dust proved fairly satisfactory last season, but different lots did not seem to give the same efficiency, which was later found to be due to variations in the nicotine content of the tobacco dust.

Finally Professor Smith decided that the only way to obtain a uniform product was to make up a suspension of suitable amounts of kaolin and lime and to add nicotine sulphate in any amount desired to make any specified strength. Later came the development of a method of spraying the nicotine sulphate onto a finely sifted mixture of hydrated lime and kaolin. When the material comes out of the factory, which is run by the Walnut Growers' Association, it is in a very finely divided condition so that it blows well.

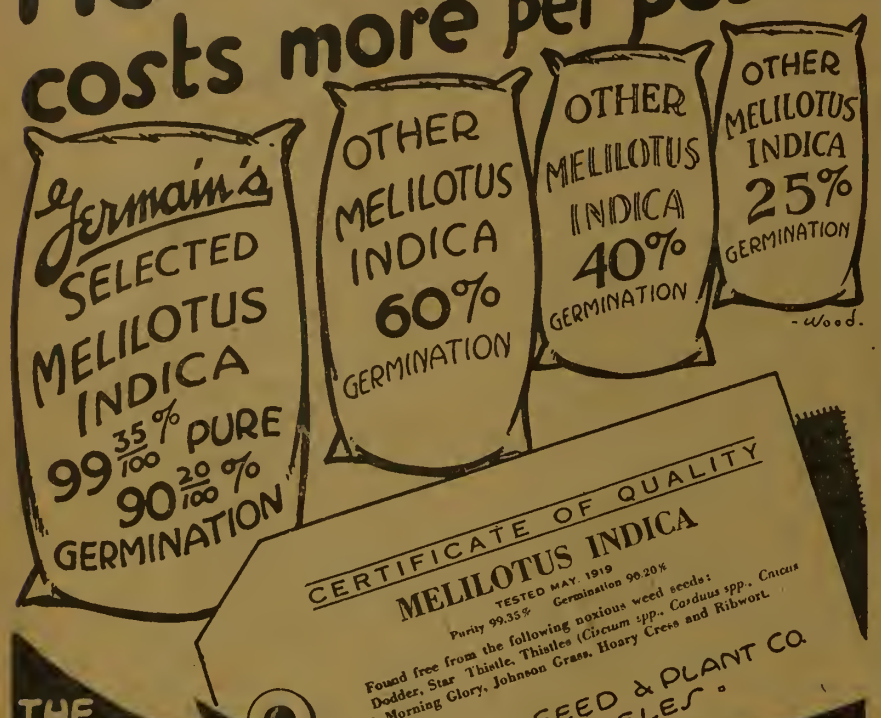
From two to three pounds of the material is the average application per tree and will give a 95 per cent kill. The cost of the material is five cents per pound at the factory. Costs of application vary, but a number of commercial operators are dusting trees at five cents each, which makes the total cost range between 15 and 20 cents per tree.

The kill is effected largely by the fumes and is very rapid, as within a few minutes after dusting clouds of dead aphis may be seen falling from the trees. The zone of effective killing is comparatively large as for two or three rows beyond the dusted area the trees will be found to be comparatively free from aphis.

In short, the new method has at one stroke cut the cost more than half and made it possible to get over the orchard from five to six times as fast. In fact, it has made it possible to profitably fight the aphis. If the loss per acre is $15 and the cost of dusting $4, one can readily see that it will pay to dust. The new method also gives promise for successful control of the new codlin moth worm, for which it is now being used in infested areas, dry powdered lead arsenate being added to the aphis dusting compound.

It should be pointed out in connection with a discussion of aphis control that it is futile for a grower to dust or spray his orchard when he is surrounded on all sides by untreated and infested orchards. Within a few days his infestation will be about back to where it was from the wind having blown them in from neighboring orchards. Aphis control is, strictly speaking, a community problem. With the new method it seems possible to quickly and effectively cover a large enough acreage to make one application sufficient. This is apparently what has occurred this past season in Santa Barbara County, it being reported that practically every orchard in the county was dusted.

Why Germain's Melilotus Indica costs more per pound



THE CERTIFICATE OF QUALITY

Germain's PROVEN Melilotus Indica seed costs more per pound because—

——it is proven, tested seed.
——it has highest percentage of PURITY and GERMINATION.
——it is recleaned and scarified. (Tight outer hull is removed to assist quick and easy germination). This is an expensive process, but results justify the cost.
——it develops extra long roots which loosen the soil and release valuable growing elements. The surface growth is thick and lush which provides a good mulch when plowed under.
——it is practically free from weeds. You obtain almost 100 per cent. pure seed.
——it is the KING of Cover Crops.

Results obtained with Germain's Melilotus Indica seed more than justify the difference in price—and it's RESULTS you are after.

Don't wait until last-minute demand causes prices to rise. Order now and obtain lowest possible quotation.

Methods That Are Different

PEOPLE in commercial life are continually catering to that everlasting desire of the human for something different, and with them it pays—sometimes. The farmer is more inclined to stick to "dad's way," notwithstanding he has been fairly free to supply himself with up-to-date implements and appliances. But when it comes to theories of planting, of pruning or other cultural methods, "the old way is the best." However, Dr. J. C. Whitten, termed "dean of American horticultural teachers" and recently installed head of the division of pomology of the University of California, is making some demonstrations and giving a number of quiet talks which are convincing many that a greatly increased crop of deciduous fruit may be had by methods that are different.

The prevailing custom in deciduous orchards of California and we imagine of all fruit growing sections, has been to use the first three years growth of the tree merely as a foundation structure for the tree which shall grow after these three years, and as a foundation proposition it has been the theory that we must build low, in other words the pruning has been very severe, leaving stubs of only six to eight inches of the preceding season's growth. This has induced exceedingly strong wood growth, which each year has been sacrificed. Now Dr. Whitten says this is all, or at least nearly all, radically wrong.

One of Dr. Whitten's theories is: "When you start anything put it over," and he certainly is putting over the theory that the longer branch with well distributed leaders, two or three of them, from this branch shall be encouraged. Thumb pruning during the growing period reduces the ambitions of all those branches other than the three which have been selected. Two, three, or a half dozen leaves may be allowed on these as a protection to the main branch and to encourage fruit spurs distributed along the branch. The growth of these fruit spurs is also encouraged by the open head which admits sunlight to all parts of the tree. This open head is maintained by continuous summer control rather than by heavy winter cutting.

At first look it appears that this system of pruning would result in pulling the trees to pieces by the first heavy crop, but the general distribution of the fruit spurs close to the leaders, or principal branches of the tree, saves the tree from breaking or being pulled down by the large crop which sometimes sets near the tips of the branches under the old system.

Dr. Whitten is doing much of his work in connection with farm bureau center meetings, and his blackboard talks are almost equivalent to actual demonstrations in the orchard.

Results in Plum and Prune Pollination Tests

General results of five years' testing of 17 varieties of Japanese and European plum types in which more than 100,000 hand pollinations were made and more than 175,000 blossoms were counted have been made known by A. H. Hendrickson, assistant professor of pomology University of California.

The Japanese varieties, Combination, Kelsey, Satsuma, Burbank, Wickson, Sultan and Abundance, are self-sterile to their own pollen, says Professor Hendrickson. Among the European plums and prunes Clyman, Tragedy and Robe de Sergeant are clearly self-sterile, though Imperial, while occasionally setting fruit with its own pollen, is too uncertain to be classed commercially as anything but self-sterile. Grand Duke is said to be probably self-sterile.

Reported to be clear-cut and consistent throughout the five years, the results obtained in most cases are said to show that the French Agen and Sugar prunes are undoubtedly self-fertile. Professor Hendrickson declines to draw any definite conclusions as to the pollination of Pond and Yellow Egg as these were tested for sterility for only one year.

Inter-species crosses were not attempted, but cross-pollination of Japanese as well as European plums is effective, it is stated, if their blooming periods occur approximately on the same date. No cases of inter-sterility were reported found.

Whitewash on Young Trees

Dr. Whitten says: "Whitewash your trees at planting." He and other investigators have demonstrated that the temperature of the sap in the trunk and small branches of the deciduous fruit tree is much higher than that of the air around it. This is especially true in the winter time. This is during daylight hours, of course; when the sun goes down the reverse is true, hence great injury to some trees because of this extreme variation. A whitewashed tree, on the other hand, instead of absorbing the heat from the sun, reflects and refuses to take it up.

This hint may not be exactly timely, but the fruit grower who is today observing some of the results of sunburn on the southwest side of his trees may the more easily absorb the lesson and be prepared with the coming of the next winter season with whitewash. Strange as it may seem most of our sunburn comes from the winter's sun. The variation in sap temperature is far greater in the winter because of the correcting power of the sap continually being pumped through the tissues of the tree when the processes of growth are under way.

INCREASE PRUNE YIELD BY PRUNING SYSTEM

Short courses in horticulture to be given at the University of California Farm, Davis, from December 8 to 20, will explain the new system of pruning advocated by the university whereby the average yield of the trees pruned is said to be about four times as great as that of trees of the same age pruned in the old way.

Questions as to the possibility of changing bearing apricot, peach and plum trees from the old plan of pruning to the new system are dealt with in the course. In general it may be said that this is very easily done. Interested growers are invited to inspect apricot trees growing at the University Farm to see what has been accomplished with these trees five years after the pruning system was changed.

SPRAYING FOR APPLE PLANT LOUSE

In order to control the aphid in the egg stage the material used must prevent the nymph from hatching or it may be of such a nature as to kill the nymph as it hatches. The preventive may act in several ways. Any substance which will harden the outer semi-transparent shell and thus make it impossible for the nymph to emerge would be satisfactory, or the material used could have the opposite effect, that is, soften or dissolve the outer layer and thus expose the inner, pigmented layer to evaporating factors such as wind, heat or low humidity. Furthermore, many substances are splendid desiccating agents, and any material possessing this quality might be able to extract the water content of the ovum or embryo and thus prevent further development. Again, the use of any toxic substance which will penetrate the egg coverings and attack the living embryo would naturally be a control measure. Another possible means of control would be the discovery of some chemical which will loosen the egg from the twig and cause it to fall to the ground.

DEHYDRATING FRUITS AND VEGETABLES

Greater attention was never given to the study of preparing California products for market than during the last two years. Our distance from even the American markets has made most attractive the drying and dehydrating of products which heretofore have been canned and sent to market at great transportation expense. Unfortunately more delicate flavors could not be preserved when dried and these products were not so popular as the canned. However, improved processes have greatly increased consumption of the dried and evaporated product, and the transporting of thousands of tons of water has been saved. Scarcely a section of the state but now shows the installation of evaporators or dehydrators, and fruits and vegetables of nearly every kind are now going forward sans water.

"PRACTICALLY PEELED" POPULAR

The California Peach Growers Inc. has found its "Practically Peeled" so popular that a large proportion of its output will this year be so processed. In a few years the management believes its dried peaches will practically all go out in this form. Since securing patents on the "Practically Peeled" process the association has proceeded to have perfected the machinery for the work and has just received patents on machinery.

LA HABRA FUMIGATING

M. J. Pickering informs us that the La Habra Citrus Association now has three outfits ready for a clean-up of the orchards of members of the association. Liquid gas will be used exclusively. The fumigation will be under the general direction of Mr. La Follette of the Leffingwell Ranch.

CONGRESS APPROPRIATES $59,000 FOR GRAPES AND NUTS

The federal congress has appropriated $59,000 to be devoted to study of grape and nut problems. $39,000 goes to solving problems of nut culture; $20,000 to study of the utilization of wine grapes in California after prohibition becomes effective.

Pomona Air Cleaner

Keeps Dust Out of Tractor, Truck, and Auto Motors

Would you allow anyone else to pour grit into your motor? Are you doing it yourself? Examine and see. For every grain of dust that sticks in your carburetor intake, a million go on through to grind out your motor.

Let a Pomona Air Cleaner protect your motor. Do not wait until the damage is done. Get one now.

If you already have a clarifier be sure to examine and see whether it is doing its work. You can use both kinds together if you like. We guarantee that you will not find any dust in the air that has passed through the Pomona Air Cleaner. If, on trying the two together, you find that your present equipment is giving your motor protection we will gladly take back our apparatus and refund your money.

Above all else keep dust out of your motor. Treat your motor right. Send for descriptive circular and names of users in your neighborhood.

If you buy a tractor, truck or auto ask your dealer to equip it with a Pomona Air Cleaner.

Liquid Gas

For Citrus Tree Fumigation

Made from Areo Brand Grade X Cyanide furnished by The American Cyanamid Co. of New York

Our plant is nearing completion and will he ready to make liquid gas in any amount required. As previously stated, we have made connections with the American Cyanamid Company of New York, which is going to furnish us with cyanide for our entire output of gas thie season, at a price which makes it poseible for us to furnish you the liquid gas at the rate of 65 cents per pound at the plant at Azusa. We will contract to do this in any quantity and the quality will be guaranteed under state inspection to he 96.98 per cent pure. Containere for eame will he eold to you at the plant, at eost. Pumps will be about the eame price as last year. Delivery hae been arranged for at a price which will cost much less than you can afford to haul the eame for, and this delivery is guaranteed to he eatisfactory.

This gas is made under our patents granted by the U. S. Patent Office, and our improved methods and enlarged plant, huilt under epecification of the most skilled engineers and chemiets employed by the American Cyanamid Company, make it possihle to render you the eervice that you will require, and our guarantee is backed by them.

We invite you to the plant at any time, and will be glad to ehew you its workinge.

Degraded Fruit Vs. Cost of Spraying

Fruit that is not free from the smut caused by the Black and Citricola Scale suffer severely in grading. At present prices of oranges the loss from degrading will run from 50 cents to several dollars per tree.

The cost of the material Tizit Spray is only from two cents for a two year old tree to 15 cents for a 20 year old tree.

Properly applied at this season Tizit Spray will rid your trees of a very large percentage of the Black Scale and Citricola hatch thereby preventing the deposit of honey dew and the consequent accumulation of black smut which not only causes the fruit to be degraded or culled but decreases the producing power of the tree.

Well informed fumigators are now advocating the use of Tizit Spray to control the Black Scale. Its numerous and irregular hatches make it impossible for the fumigator to operate in all groves at "just the right" time to get a good kill. Often much Black Scale is left to propagate next year.

On groves sprayed with Tizit, fumigating for Red or Purple Scale can be done at almost any time during the season with the full knowledge that the job will be a good one as Tizit will supplement the work by destroying the Black Scale that hatches after fumigation. Tizit once applied is effective until washed off by heavy rains.

Tizit is not an oil base spray. There is positively nothing in its composition that is injurious to tree and soil. Trees sprayed every year for the past five years with Tizit passed the 8 to 1 test several weeks ahead of other groves in the same vicinity last fall.

Tizit Spray costs less than half as much and works all summer.

Let us show you how you can net more money from your trees by using Tizit Spray.

Irrigation and the Alkali Problem

By W. P. Kelley

Prof. Kelley's article began in last issue of the Cultivator. In a word it consisted of a warning as to the waters used in irrigation. Especially is there danger in overirrigation. Dr. Kelley continues:

Unfortunately the movement of alkali from higher to lower levels through the leaching action of irrigation water is not the only means by which soils actually become injuriously charged with alkali. It is possible for soils which previous to being brought under irrigation were free from alkali to become heavily charged with alkali without the intervention of any seepage whatever. Such, in fact, is actually taking place on a sufficiently large scale in the citrus area today to warrant thoughtful consideration. Reference is made to the use of irrigation water that itself contains alkali.

In the later part of the 19th century considerable attention was given to the quality of irrigation supplies. More recently, however, the main consideration seems to have been given to the quality of water available. Irrigation supplies and systems and localities as well have come to be judged quite largely on the basis of the amount of irrigation water available, and general interest has come to be centered largely on the quantity of the water available, with too little consideration as to its quality. The result has been that in a number of instances, even in the citrus belt, growers have come to apply water of extremely poor quality. In a few extreme cases my attention has been drawn to the fact that growers, while admitting that their irrigation supply is not palatable even to live stock, apply it to the land freely and with apparently no thought concerning its permanent effects. Fortunately the area of citrus land that is being irrigated by such extremely poor water is comparatively small. However, there are considerable areas now being irrigated with water of sufficiently poor quality which with long continued use will almost certainly result in a dangerous accumulation of alkali.

It may possibly be helpful in forming a clearer understanding of this matter, and enable the grower more clearly to see the relationship between irrigation water and the accumulation of alkali, to present the problem in a more concrete way.

In the analysis of irrigation water the results are commonly expressed in parts per million or in grains per gallon. You may be interested to know that grains per gallon may readily be converted into parts per million by multiplying by 17.1. In our work we express the results in parts per million. Whichever method may be used is immaterial.

Now suppose the analysis shows 100 parts per million of a given constituent. One acre-foot of such water will contain 270 pounds of that constituent. As a general rule it is probable that the average citrus grower actually applies to groves eight to ten years or more of age approximately two acre-feet of water per acre per annum as a total of all the irrigations for a single season. At this rate, water containing 100 parts per million, of common salt for example, will supply to the soil 540 pounds per acre per annum.

At first thought this does not seem to be worth considering, but 540 pounds per acre per annum, if repeated annually for 20 years, will equal 10,800 pounds. In this connection it should be understood that no soil has the power to absorb an indefinite amount of alkali; if it be not absorbed either by the crop or the soil or drained away an accumulation will ultimately result, it being merely a matter of time, which in this case will be determined by the amount of alkali in the water and the nature of the soil. Instead of the water containing 100 parts per million, suppose it is found to contain 200 parts per million, then the amount that will be added in one season will be 1080 pounds or about ten pounds per tree. If it contains 400 parts per million the amount will be 2160 pounds, and so on.

If the soil to which the water is applied be located where the rainfall is light, or be of a heavy character, or if it be underlaid with hardpan or even a compacted layer through which water penetrates with difficulty, or perhaps not at all, it is certain that little or none of the soluble materials added in the water will be removed by leaching. Between irrigations the water that has been applied and which did not pass away as run-off evaporates or is absorbed by the trees. When water evaporates the materials which it held in solution are left behind in the soil. They do not pass off with the water and citrus trees do not have the power to absorb any notable amount of the common alkali constituents.

Consequently under such conditions the application of water that contains alkali will be followed by the inevitable tendency for the alkali to accumulate in the soil. In the course of time it is highly probable that an injurious concentration will result.

While I wish to confine this paper mainly to a discussion of the means by which alkali accumulates in soil, having in mind the possibility of an excessive concentration finally resulting, it should be stated that the application of water containing only small amounts of alkali may produce very important and injurious physical effects in soils.

It is evident from the foregoing that the composition of the water is a matter of primary importance in irrigation, especially where the rainfall is light and drainage inadequate. Any grower or district whose irrigation supply is of high purity is indeed fortunate, and I am pleased to state that the irrigation supply is of high quality in a very large percentage of the citrus area. Unfortunately waters of poor quality occur in quite a number of localities, and these are widely scattered over the citrus area. They occur more commonly in some localities than in others, however.

In recent investigations on this subject we have found that with only a very few exceptions all of the large irrigation supplies in use on citrus are highly satisfactory and practically all of the really bad waters now in use are drawn from wells. While I do not propose to dwell on the matter at present the information already assembled abundantly establishes the fact that the water from every well, with the possible exception of those located near a large watershed, should be analyzed before being used. Had

this policy been pursued in the past and its teaching heeded, a number of cases of serious disaster might have been avoided.

There are a number of instances where the owner of a given piece of land either neglected to purchase water rights from already available supplies of high quality or transferred previously existing water rights after having developed a private well of his own. In a number of such cases the results have already proven disastrous. Several hundred acres have already been seriously injured by this very means, and I may state in passing that this applies both to citrus and walnuts and in some cases to soils of exceptionally fine quality. The small annual saving from the use of privately owned wells whose quality happened to be poor has been offset many times over by the later damage to the crop and in more or less permanently injuring the soil for many other crops.

I cannot too strongly urge the importance of using the purest water obtainable, even though it necessitate a heavier annual expense. Certainly it is not putting the matter too strongly to say that the quality of every new irrigation supply that is to be developed in the future should be thoroughly tested before it is actually applied. Our information on the injurious effects of impure water have become so completely convincing as to leave not one doubt concerning the wisdom of this course.

From the foregoing brief statements it would appear to be evident that there is a close connection between irrigation and the alkali problem, both from the standpoint of seepage and the quality of the water that is applied.

It should not be inferred from the above that a definite degree of injury can be positively forecasted from the use of a water of a given composition for a stated period. There are ameliorating influences in soils, the nature of which are under investigation but which are not as yet completely elucidated, which materially influence the effects that will be produced on crops. The important point to remember is that the use of water containing any notable amount of alkali is a matter which should engage the thoughtful attention of the irrigator and that the time is likely to come when injury will result from its use.

In this connection the question naturally arises, what constitutes a satisfactory irrigating water and how much alkali is it permissible for irrigation water to contain? These are pertinent questions for the reason that chemically pure water does not occur in Nature; all irrigation supplies contain at least small amounts of soluble materials. Unfortunately I am not able to give a definite answer to these questions. I can safely say that as a matter of public policy nothing but the purest water that can be economically obtained should ever be applied. In general it may be said that the effects that will follow and the length of time before injury be produced by a given supply of impure water depend on the nature of the soil and the amount of drainage that actually takes place from the soil.

An irrigation supply containing a given amount of alkali will produce injury to citrus on some soils in a shorter time than on others. Where no important amount of actual drainage takes place and the soil was practically free from alkali at the outset an injurious concentration of alkali will usually result sooner on light soil than on heavy soil. Injury is generally felt on shallow soil, if it be not underlaid with an open, porous stratum, in less time than on a deep soil or a well drained soil. The effects are shown more readily on soils containing little or no organic matter than on soils well supplied with organic matter. The presence of large amounts of gypsum appears to ameliorate the effects of alkali. Citrus groves that are well cared for, with the soil kept in good physical condition and liberally supplied with manure or other organic materials, likewise are more tolerant of alkali. Infestation of scale and other injurious insects increases the susceptibility to alkali injury. In fact, any unfavorable soil or climatic factor or tree condition is likely to be more serious where alkali is also to be contended with.

Since the above named conditions are extremely variable, sometimes even in a single grove, it is evident that no hard and fast rule can be laid down concerning the time which will be required to produce injury by an irrigation water containing a given amount of alkali. Ordinarily each case presents a problem in itself and must be judged on its own merits.

One of the important points that I wish to leave with you is this, that any soil which, either through seepage or the application of irrigation water containing alkali, is receiving greater amounts of alkali than are being removed by leaching or absorbtion is on the way toward becoming an alkali soil. Such a soil may never become heavily charged with alkali owing to the intervention of some circumstance which changes the relationship between the income and outgo of alkali, but unless the removal, at least periodically, equals the annual increment the time will come when an alkali problem is inevitable.

From the standpoint of irrigation water containing alkali, as well as from seepage, it is evident that drainage is an indispensable adjunct to permanent irrigated agriculture.

LABEL FRUITS AND VEGETABLES

Fruits and vegetables in package form should be labeled with the quantity of contents when shipped within the jurisdiction of the federal food and drugs act. The requirements of the net weight amendment to the act in its application to the labeling of fruits and vegetables in package form have been widely distributed among shippers and other interested parties. Shippers of fruits and vegetables who fail to comply with the requirements of the law are liable to prosecution. Food inspectors have been instructed to watch interstate shipments of fruits and vegetables during the season to see that the packages are labeled with the quantity of contents in accordance with the requirements of the law.

Male employes of canneries have also been placed on an eight-hour day basis.

ESSEX MOTORS DETROIT U.S.A.

Join The Half Million

Used In 3000 Cities, Its Admirers Are Now Legion

Who Praise The Essex

The Essex is now known in more than three thousand towns and cities.

Deliveries of new cars approximate a hundred a day.

Thousands, through demonstrations made by dealers and rides with friends, are daily learning the qualities that account for Essex popularity.

Their knowledge, like those who have not yet ridden in the Essex was limited to hearsay. But their impressions were most favorable because of what others had told them.

Won't You Too Join Its Army?

You too, will volunteer your endorsement, we are sure, if you will but ride in the Essex.

It has never failed. Our estimate is that more than half a million have ridden in it and are telling their friends about the Essex.

Such praise is not misplaced. We don't believe it greater than the car deserves. But that you will be able to judge after you have ridden in the Essex.

Points Others Speak Of

Note how motor car talk quickly turns to the Essex.

When light, cheap cars are spoken of their qualities are usually compared to the Essex. Then someone says, "But the Essex also has ————" and from then on Essex qualities are compared to large costly cars.

It isn't likely that anyone will say any light similarly priced car approaches the value of the Essex.

In performance, for instance you won't hear it classed with any but the most powerful.

And so with its riding qualities, which are invariably compared to high priced large cars.

So is the detail of finish and beauty judged by such standards.

Comparison with other light weight moderate priced cars can be made only with their respective first and operating costs.

Can You Resist The Invitation?

We hope you won't delay in accepting our invitation to ride in the Essex.

The result, we think, will be your leaving an order to be filled as soon as possible. We know you will help spread the news about the Essex, for it must inspire you with the same admiration others voice for it.

—Rice Cleaning Problem Solved—

Rotary Grain Cleaner

A new principle—simple of operation.

It cleans RICE perfectly in one operation.

A big time-saver in separating water grass from rice.

It eliminates shrunken and split grain.

This machine is a revelation to rice men.

A one-horsepower-engine will run it under full load.

The Rotary Grain Cleaner also cleans Wheat, Barley, Oats, and Kaffir Corn.

The Farm Wood Lot

By Ernest Braunton

THERE is no farm on which a woodlot would prove a burden nor is there one on which it would not prove a blessing. Every farm at times is seriously in need of timber and it costs both time and money to run to a lumber yard and often a good pole or log would serve the purpose far better than sawn timbers.

To be sure, times have changed. Auto trucks have nearly removed the need for hastily improvised poles or tongues and reaches. Electric, gasoline and steam power have made horse-power sweeps unnecessary, but a load of loose hay needs a binding pole no matter what power propels the vehicle. Fence posts will always be in demand, for if steel or concrete posts become common it will be because they are cheaper than wooden ones, and better uses will be found for wood. While the woodlot is growing it will provide shade and shelter for live stock or even for the family, perhaps neighbors and friends. A good woodlot provides a fine picnic ground for all who come and in ever so many ways, even as a landscape feature, the woodlot is a blessing. It matters not what tree you use, whether eucalypt, locust, catalpa, cottonwood or what, it will still be both useful and beautiful.

Loss of Bulbs

Much has been written of the loss of bulbs through leaving them in the soil throughout the year. Bulbs have now been in the writer's garden for 14 years without being dried up or rotted. Some are dug up but once in five years and immediately replaced. A variety of kinds have been left in this way and the percentage of loss has been no greater than when dug up each year.

Home Trees

The average house, even though surrounded by flowers and lawn, does not provide a complete home. In the dim past all people have looked to wood and forest for shelter, and because it is natural we shall always seek the shade and shelter of trees. For this reason a home place looks bleak and barren if no trees are in evidence. They need not be placed on all sides of the house; it is usually best not to have any on the front. One or a few may be planted on the sides but the greater number should be at the rear, giving the appearance of the house having been built in the shelter of a wood or grove of trees. Such places always look homelike and inviting to the passerby. They are homes in fact to those who are fortunate enough to dwell therein.

The Best Vine

Someone asked me the best vine for pergola, arbor, or covered seat, where summers' shade and winter's sunshine was needed, and also the biggest possible show at blooming season. There is no vine for such a combination of needs that will equal the Chinese trumpet flower, Tecoma grandiflora. It is now in bloom in local sections and attracts more attention than any vine we grow. No wistaria or other wealth of blossoms arrests the eye of all compared with this orange-red trumpet flower. It is the largest in size of blossom of all the family and no other member produces more flowers. It is hardy over all the south half of California and doubtless will stand much cold. It is a rapid grower, not so much in length of stem but it makes a thick bush as it grows upward and not a string or strings of thin growth. It is not yet common.

Alkaline Hilltops

"A Reader" lives on top of a hill where there is a thin soil of black adobe underlaid with shale some of the strata of which are loose and covered both top and bottom with a white powder. Trees do not thrive even though holes have been blasted several feet deep. Nearly a hundred feet below, on one side, alkali shows on the sides of a ravine. Such conditions are not unusual. A half dozen complaints of like nature have come in from points in Los Angeles. The north side of Westlake Park is at the foot of a shale hill, hardly any soil on top, and no good blue-grass lawn may be grown in that part of the park even though under-drainage has thrice been resorted to. A little strongly-alkaline water constantly oozes into the lake from that side. The remedy would be to dynamite clear across the hilltop so the alkali could be washed down and out. Mere pockets but provide settling basins for it.

Native Shade

For a quick summer shade that costs little it is hard to beat our native clematis. It naturally grows in poor, dry soil and when given a fair garden chance grows faster than any vine in my garden. A root was dug up in a gravelly canyon three years ago and this vine now extends 40 feet, though each year it has been heavily pruned. It holds its leaves merely during the hottest weather and is several months bare.

The Water Question

It is not hard to choose garden shrubs and trees that will safely pass through each year, after the first, without other water than the winter's rains. But there is not one of them but makes better growth and appearance when well supplied with water. Therefore no garden can be made grandly attractive in the summer season except a copious supply of water is given. How much time and water are you willing to exchange for a good-looking garden?

Hardy Limes

In the writer's garden a Bears seedless lime was badly injured by frost last year, while a Eureka lemon, navel orange, and kumquat close by were not harmed. This lime is eight years old and has been frost-damaged each year. It was obtained from one of several firms who advertise this lime as hardy. The writer is not alone in this experience and has never seen a lime as hardy as the lemon. This opinion is written after many years observation and it is folly to advertise plants as hardy which each year are harmed when growing with oranges and lemons that remain undamaged.

Resting Rose Bushes

If rose bushes have been well watered up to the present it will prove profitable to let them go without water until September. Then may you prune them as you wish and irrigate them freely, for fall flowers. You may merely prune out small weakly wood and leave the heavier pruning

until spring. Or you may prune heavily and get a fine fall crop of roses. Last year I did not prune mine until September 25, two weeks late as a rule, yet the fall crop was the best I ever had. They were pruned very heavily, some of the wood was cut where it was a full inch in diameter. The bushes were a dozen years old. The first of September is a good time to prune, and awaken with plenty of water.

Modern Petunias

For the amount of money and time expended no plants have given me better results than a fine strain of petunias grown from seeds. The latter were sown in bare spots in beds of other plants and when three inches high were transplanted. They have grown to large size and are in flower all summer, with large blossoms of good colors, nicely flounced and fringed about the edges. But do not buy common petunia seeds. Get the best. They require no more care or space than the poorest.

Vegetable Seed Improvement

By S. S. Rogers

THE planting of good quality vegetable seed has always been considered one of the most essential influences affecting the value of the crop. During the past decade interest in the proper selection of seed has continually increased until at the present the thoughtful and successful grower considers this of first importance. Good seed true to type means larger yields of high quality crops, with a correspondingly larger net return per acre than when seed of poor quality is planted. It may therefore be readily understood that the initial cost of the seed is neglible as compared to the quality.

In speaking of the quality two conditions are meant, first germination, second the strain trueness to type or pedigree. There are two methods for seed improvement: Crossing, or hybridizing; and individual plant selection. The former method is more or less uncertain and requires considerable time, experience and effort, while the latter is much easier and may be successfully carried on by those who are careful and consistent. The question of hybridizing will not be considered at this time but a few of the more important points upon the subject of seed selection might be of interest.

The first and most important consideration is to have a definite object or ideal to select to. This may be higher yields, better quality, degree of earliness of maturity, uniformity of size, color, etc. In considering the above points, the demands of the market must be met as closely as possible. It is also essential that the selection be carried on by the same person and a written description of the ideal be made in detail in order that the work may be carried on systematically.

If the selection has for its object the continuation of a certain variety of vegetables such as Los Angeles lettuce, Stone tomato, etc., the characteristics of the variety, together with the improvement, should be carefully studied. In order to keep the strain from deteriorating continuous selections are necessary from year to year, for unless this is done the strain will break up and more or less inferior plants will be present.

It is always best to select to one principal quality, but oftentimes it is possible to improve other conditions at the same time. This, however, should not be done at the expense of the main object of the selection. As an example, in selecting tomatoes for earliness it will undoubtedly be found that a number of plants come into bearing at the same time, which gives an opportunity to choose from these the ones which bear the best quality product. This choice, however, should under the above conditions never be made at the expense of earliness.

In selecting such crops as tomatoes, melons, etc., the character and quality of the entire crop on the vine should be considered and not that of the individual tomato or melon. In selecting for earliness it is not necessary to save for seed the first individuals to mature but those vines which are chosen for their earliness should be marked before harvesting starts. In the selection of such crops as lettuce, cabbage, beets, etc., the individual plants should be considered.

To summarize the principles of seed selection: The grower should know before the selection is made what he wishes to attain, and in the choice the demands of the market should first be considered. One should endeavor to confine the selection to one principal object and a written description should be made. Continuous selections should be made each season, and where possible the work should be performed by the same person.

Australia's production of dried fruits for this season is estimated at: Currants, 5,500 tons; Sultanas, 6,500 tons; Lexias, 2,500 tons; total, 14,500 tons.

English buyers are reported in California looking after supplies of apricot pulp which may be shipped to England for jam making.

CALIFORNIA ALMOND GROWERS PROSPERING

The plant of the California Almond Growers at Sacramento has been erected at a cost of $100,000. Improvements are now being made at a cost of $10,000. In addition the association has purchased land adjoining on which it proposes to erect a four story concrete building.

FRUIT PICKERS WAGES

Fruit growers of Morgan Hill, Santa Clara County, are paying 40 cents per hour for day labor, ten hours, and $6.00 per ton for picking prunes.

One of the first essentials to satisfactory marketing arrangements is standardized products. Cans, jars, and other containers should be uniform in pack, appearance, quality and condition. Every container which is fully up to the standard represented by the label or brand will then be an advertisement in itself and often a guaranty to further purchases.

Last year members of the Prune and Apricot Growers' Association received $37.50 per ton for apricot pits. The management reports prospects for even better price this season.

MOLINE RICE BINDER

Conditions under which rice is cut demand a binder that has strength throughout, one whose working qualities are positive and dependable, one that insures a maximum of traction at all times and one that provides protection against the inroads of dampness and mud. Rice growers can make no bigger mistake than to go into the field at cutting time with an inferior machine that causes costly delays at harvest. The Moline Rice Binder will measure up to the most exacting requirements. It is quality built throughout and overcomes the hindrance of actual field conditions.

For this convenience the driver will find that every adjustment necessary for the best work can be accomplished with the least time and exertion on his part.

The utility of the Moline Rice Binder is a big feature. Its outstanding mechanical superiority will be found in shafts and bearings, gear drives reel, open end elevator, clearance roller, elevator aprons, top drive, apron tighteners, aprons, anti-winding washers, butt adjuster, and tried and true binding attachments. Simplicity and positive action is the feature of each working part.

The Moline Rice Binder will grip the ground under the wettest conditions and because of its ample protection to affected parts it will withstand the rotting and corroding action of water and mud to give years of satisfactory service.

A Moline-Universal Tractor hitch can be furnished so that one man has complete control.

Review of California Celery Season

By H. H. Warner

CELERY has been produced commercially in California for about 20 years. The early eyperimental plantings were made in the vicinity of San Francisco, but the first real commercial production was in Orange County, in Southern California in 1893. D. E. Smeltzer, who came from Kansas City after an unsuccessful attempt to grow celery in Florida, was the first one to see the possibilities of the industry in this state. Through his efforts the peat beds and river bottom lands of the Santa Ana River, between Santa Ana and Huntington Beach, were drained and the water carried away through flumes and ditches to the ocean some five miles away. This wonderfully fertile soil was well adapted to the production of celery and for a number of years this district was the only celery producing section in this state.

Two Big Growing Districts

In recent years the acreage grown in Orange County has gradually decreased, owing mainly to the increasing losses from celery blight which seems to be very difficult to control. Continuous heavy cropping on the soils in that district has also reduced the production per acre. Most of the celery now produced in Southern California is grown in the truck garden section around El Monte, where shortage of rainfall and presence of insect pests seem to be the limiting factors.

As the shipments from the southern part of the state have fallen off, the production in Contra Costa and Sacramento Counties, in what is known as the Sacramento River Delta section, has increased proportionately. For several years the shipments from Orange and Los Angeles Counties, once the most important producing area, have been scarcely one-third of the total output in the state, and the central district, some 400 miles farther north, has taken its place. The limiting factors in this district are occasional frosts and unseasonable rains, which cause heavy losses.

When the industry was in its experimental stage the mistake was made of planting in the spring for the production of summer celery. After a few years, it was found that the proper time to plant in California is during the months of July and August, which brings the crop to maturity during November, December, January, February and March. This is now the regular time to harvest, in both the central and southern districts. Beginning in the middle of fall, the shipping season is well under way on the first day of the winter months and continues, interrupted only by severe winds, serious freezes or exceptional market conditions, until all the crop is moved or early spring weather develops seed stock of objectionable length.

Eastern Demand Growing

The rapid growth of this industry in California has been due to the fact that the celery can be placed on the Eastern markets in a fresh, crisp condition during the winter months when there is little competition from other sections. California celery commands a good price for the Thanksgiving and Christmas trade when the only competition comes from Eastern storage celery. During February and March it still commands the top price, although it meets some competition in early celery from Florida. In the season 1918-1919, California shipped 480 cars out of a total for the United States of 4528 cars. California's only close competitors are New York with 1260 cars, and Florida with 978.

Eastern consumers are demanding more California celery every year and, if insect pests and diseases of the plants can be controlled in the field, there is every reason to believe that the industry will continue to expand The average yield in the field runs from 1000 to 1200 dozen bunches to the acre. The fields are usually cut over several times and a total yield of one carload, or about 172 crates to the acre, is not uncommon.

Marketing Method

The marketing methods of the two producing sections of this state are very distinct. The grower in the Sacramento River Delta section contracts his crop at planting time to one of several large distributors, who furnishes him with seed and makes advances on the crop through the growing season. In the southern district the grower usually sells right from the field at the time of harvest and seems better able to finance his growing operations. In a good season, such as that which has just closed, there is very keen competition for the crops between shippers at time of harvest.

Growers' Association

In 1901 the Celery Growers' Association of Orange County was formed, with about 75 per cent of the growers in the association selling through one organization. The following year a combination was formed which gave the association practically complete control in the celery output of California at that time. During the past few years some radical changes have been made in the method of marketing the crop, until now, instead of one association controlling the entire output in the southern district, there are many independent factors in the shipping business, bidding against each other for the output.

Last Two Seasons

The year 1917-1918 witnessed the greatest area on record in the state, with a record movement of 2756 cars shipped. That season, however, was an unsatisfactory one for the growers, as facilities for transportation of the immense crop were inadequate, the markets were discriminating and the large proportion of growers who held their crops in the bank for some time, found a surplus of unsalable stock on their hands at the close of the season. In many cases prices failed to meet the high cost of production.

The acreage planted for the season of 1918-1919 just closed, was approximately one-half that of the preceding season, with a total estimated by the bureau of crop estimates of 3000 acres for the entire state. This acreage was divided as follows: Los Angeles County, 754; Orange County, 125; making a total for the southern district of 879 acres; with a total in the central district of 2121 acres.

The season just closed has broken all records for prices, and both high grade and inferior stock has been in strong demand at all times, so that, in spite of the short acreage and the generally light yield, the gross returns to the growers have been practically as large as when they grew the record acreage in 1917-1918. Some grow

ers have received around 65 cents per dozen bunches average for the entire season, which on a conservative estimate of production of 150 crates to the acre, means a gross return of about $600.00 per acre. Even considering the increased cost of labor and material, this represents a handsome net return to the grower, for his efforts.

The yield is less than last year, because the insistent demand prevailing in Eastern markets has resulted in growers shipping their stock in many cases before it had reached full size and maturity. The yield was further reduced in Southern California by dry winter weather, while the January frosts affected the production somewhat in the central district. Total shipments from the state, up to April 1, for the season just closing, have totaled 1480 cars, or a little over one-half of the total movement last year. Of this amount, the central district shipped 1103 cars, and the southern district 377 cars, or about one-third of the total shipments from the state. In any consideration of the celery movement it should be remembered that the figures given here are for solid carloads and that a considerable percentage of this crop, as well as other California vegetables, goes forward in mixed cars.

The principal shipping points in the central district are Antioch, Walnut Grove, Sacramento and Stockton, fully 90 per cent of the movement originating at Antioch and Walnut Grove. In the southern district, the principal loading stations are El Monte, Los Angeles, Smeltzer, Compton and Newmark.

Approximately half the total movement of 1480 cars was originally destined to diversion points, such as Belen, New Mexico; and El Paso, Texas. Primary destinations show that California celery was shipped to about 50 cities in the first instance. No doubt, a record of diversions from El Paso and Belen would greatly increase this showing of distribution. One hundred and thirty-four cars were originally billed to Chicago, and 127 cars to Kansas City, some of which in both cases may have been diverted. It is interesting to note that Los Angeles received 150 carloads of celery; mostly from the central district, and it is safe to say that at least 75 per cent of these shipments represented cars which were unloaded here and reshipped in small lots, in mixed cars.

The season of 1918-1919 just closing was remarkable in the way in which the Eastern markets sustained a high price range on California celery throughout the season. In Chicago the jobbing price started at about $6.00 per crate in November, rapidly advancing in December to $7.00, $7.25, and reaching $8.50, $9.00 by January 1. The top on this market occurred about February 10, when California celery was jobbing, at $12.00 per crate. Following this period, prices declined somewhat to $9.50, $10.00 per crate as the season was brought to an end. Kansas City started at $7.00 in November and advanced slowly, but steadily, to $12.00 during the latter part of February.

Pack

Celery is packed in what is known as the standard California celery crate, measuring 22 by 24 inches, and 18, 20 or 22 inches in height, according to the length of the stock being packed. These crates are packed in the fields. They are commonly known as "fours," "fives," "fives and a half," etc., according to the number of dozen bunches packed in each crate. "Fives" and larger are generally known as "No. 1s," and "sixes" and "sevens" as "No. 2s," and those crates containing eight dozen bunches and more are sometimes called "No. 3s." The highest price is of course paid for the large size, known as "No. 1s," and the other sizes are discounted accordingly. There is no system of grading employed other than this rough classification by size.

California celery is generally sold on the basis of a certain price per dozen bunches for each of the several grades and the cost of the crates is charged in addition. In the following discussion, the price referred to in every case is for one dozen bunches of No. 1 grade (5s or larger), for carloads sold f. o. b. usual terms with the cost of crates charged extra.

Prices Received

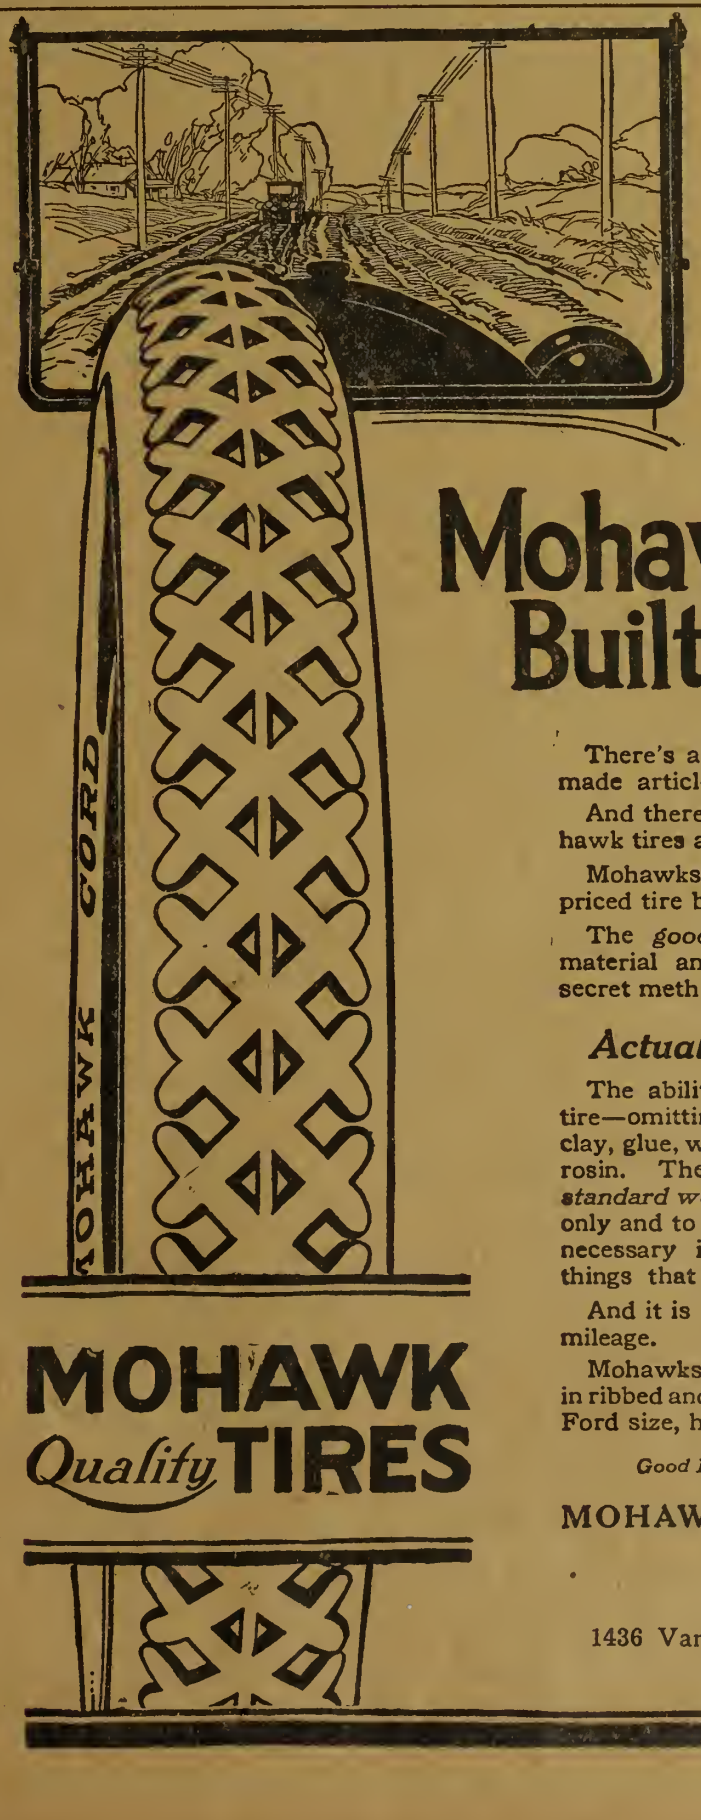
At the opening of the season, about the middle of November, best No. 1 celery from the central district was selling for 50 to 60 cents. This price advanced about the first of December and held steady through the heavy shipments of December at about 65 to 75 cents. The first shipments of southern stock from the El Monte district going forward the latter part of December were rather poorly balanced and of small size, but sold readily at a range of 50 to 65 cents for the largest sizes then available.

About the first of the year it became evident that the remaining supplies in California were somewhat lighter than previously estimated and the price advanced to a range of 85 to 95 cents on best central district stock and to about 75 to 80 cents on southern celery. A small movement of stock went forward at this time from the old Smeltzer district in Orange County, which was of larger average size and better quality than that from the El Monte district and sold for about 10 cents premium. About the 10th of January, the demand from Eastern markets became very insistent and prices on northern celery advanced to $1.00 to $1.10 with best southern stock bringing around 85 to 95 cents. Supplies, especially in the South, were at this time, insufficient to meet the demand and a wide variation in quality was evident, as some celery was cut before it had attained full size. A large share of the El Monte stock which went forward during this period was short and small, running in some cases nine and ten dozen to the crate and selling at a discount from the prevailing price on No. 1s. Toward the latter part of January the price eased off somewhat to 95 cents to $1.00 for central, and 85 to 90 cents for best southern stock.

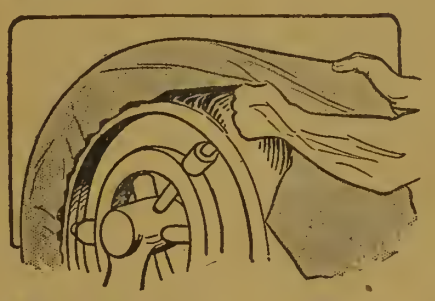
The central district was practically cleaned up by the first of February, but shipments continued to go forward from the South for several weeks, the price advancing to as high as $1.00 for the best remaining stock at the close of the shipping season in the early part of March.

MONEY IN CABBAGES

Many farmers and gardeners when considering different crops with a view to profits in production may have overlooked the possibilities of profitable returns from growing cabbages. Good plants should attain a weight of five to ten pounds each, and mature in about 90 days from planting. About 5000 plants are usually set on an acre, and may follow a crop of peas, lettuce, or early potatoes.



Even the BEST tire will not give the service it should give if used on BAD roads. Why not put these wasted tire dollars into PERMANENT GOOD ROADS?



Mohawk Mileage Built *in* by Hand

There's a big difference between any hand-made article and any machine-made product.

And there's just that difference between Mohawk tires and other tires.

Mohawks are *hand-made* by the highest priced tire builders in the industry.

The *good* tire today comes from the best material and best workmanship—not from secret methods or special processes.

Actual Value Makes the Tire

The ability to put only *pure* material in a tire—omitting all the "fillers" such as barytes, clay, glue, whiting, lead oxide, reclaimed rubber, rosin. The ability to use an extra ply of *standard weight fabric*—to use *hand* methods only and to pay for the higher priced workmen necessary in *hand* building. These are the things that mean more *actual* value in a tire.

And it is *actual* value that gives better *actual* mileage.

Mohawks are made, either Cord or Fabric, in ribbed and non-skid treads and there's a special Ford size, hand made with an extra ply, too.

Questions and Answers

ANSWERS BY EDITOR AND STAFF

Questions to be answered in this department should be received at the office one week before reply is expected. Write plainly on one side of the paper and sign full name and address. Unsigned communications receive no attention.

Farm Name

How and where should I apply in order to have the exclusive right to the name of my orchard?—Subscriber, Yuba City.

Write secretary of state for blank for making application for farm, ranch or villa name. When this is received return to the secretary of state with fee of $1, which, providing name has not been registered by others, will give you exclusive right to that name for farm or home. This merely secures right to exclusive use as a ranch name. The trade-mark right is secured from the same office at Sacramento and requires payment of $5. The form of application is as follows:

To all whom it may concern: Be it known that ..... being the owner of a ..... located at ..... County of ..... State of California, hereby applies for registration as a name for said ..... the following words .....

Rust on Rose Leaves

Enclosed find leaves from two different rose bushes. What is the matter with them, and is there any cure? On the larger the leaves fall off; on the other they curl up and look withered.—Subscriber, Chatsworth.

Professor H. S. Fawcett of the University of California answers:

"The specimens of rose leaves from Chatsworth, which you enclosed, are affected as you suspect with both mildew and rust. You speak of the writer saying that the life of the plant seemed to be threatened. If so, I would suspect something more than the rust and mildew since these are not usually severe enough to threaten the life of a plant. According to my observations, the mildew is, as a rule, more severe than is rust on roses. There is a great deal of difference in the susceptibility of different varieties to both of these troubles and, of course, the most permanent way to correct the troubles is to get rid of the very susceptible ones and plant resistant ones. Considerable relief, however, can usually be obtained by spraying the roses with sulphide of potash (liver of sulphur), one ounce to three gallons of water."

Barbed Wire Injury to Horse

What is good treatment for a horse that has wound from barbed wire injury? The wound is on the left hind leg by the knee and seems difficult to cure.—Subscriber, Tulare.

"Diseases of the Horse," issued by the department of agriculture gives the following suggestions as to this type of wound:

"One essential in the treatment of lacerated wounds is to secure a free exit for the pus. If the orifice of the wound is too high, or if pus is found to be burrowing in the tissues beneath the opening, we must then make a center opening as low as possible. This will admit of the wound being thoroughly washed out, at first with warm water, and afterwards injected with some mild astringent and antiseptic wash, as chloride of zinc, one dram to a pint of water. A dependent opening must be maintained until the wound ceases to discharge. Repeated hot fomentations over the region of the lacerated wounds afford much relief and should be persisted in."

Feed for Young Turkeys

In raising turkeys where they have alfalfa to range in would it be all right to keep a hopper of commercially prepared dried milk before them all the time, for both young and old?—Subscriber, Lakeside.

I do not know of any turkey breeder who keeps feed of any sort before young turkeys all the time. It might do for the stock that is ready for fattening, but I should hesitate to try it with growing stock. If you have found some method of feeding that is fairly successful, better not experiment. This milk may be perfectly good feed for turkeys but I should not dare to recommend it without trying it. The young turkey's hold on life is too insecure. At the Rhode Island station, when the poults are about two weeks old, sour milk is fed night and morning, a quart being allowed for every 35 or 40 poults, and the amount is gradually increased until at four months a quart is allowed for 20 birds. The turkey, unlike the chicken, is inclined to stuff its crop if given free access to any kind of feed except that found on range, and no little turkey should ever have a stuffed crop.—J. A. K.

Feeding to Make Layers

I have some Barred Rock pullets that were hatched in April. If I keep a hopper of growing mash before them and give them this same mash wet mornings, green stuff at noon and wheat at night in straw, will they have enough to eat to make good layers?—Subscriber, Lakeside.

If they get wheat enough to send them to bed with full crops every night it will not be the fault of the ration if they are not good layers. As far as I can judge without knowing the formula of the mash, it is a very good ration. Buttermilk would improve it, but many chicks reach a profitable maturity without milk of any kind.—J. A. K.

Apricots Dying

Ten year old apricot trees are dying. Last year there was much sap exuding; this year set heavy crop but the fruit dried up before ripening and leaves wilted.—Subscriber, Ballard.

The state university has given considerable attention to investigating apricot troubles and has assigned the most serious cause of losses in apricot orchards to blight very similar to the ordinary peach blight. The apricot scab or shot-hole is another serious pest of the apricot. Two sprayings each season with Bordeaux are recommended in preventing this trouble. The subscriber does not refer to the characteristic marks of his troubles, and it is possible that sour sap may be cause of the death of these trees. The sap becomes stagnant in the tissues, full of sugars which induce fermentation and later gum is formed. There is practically no help for a tree which has shown this trouble.

Geese and Games Wanted

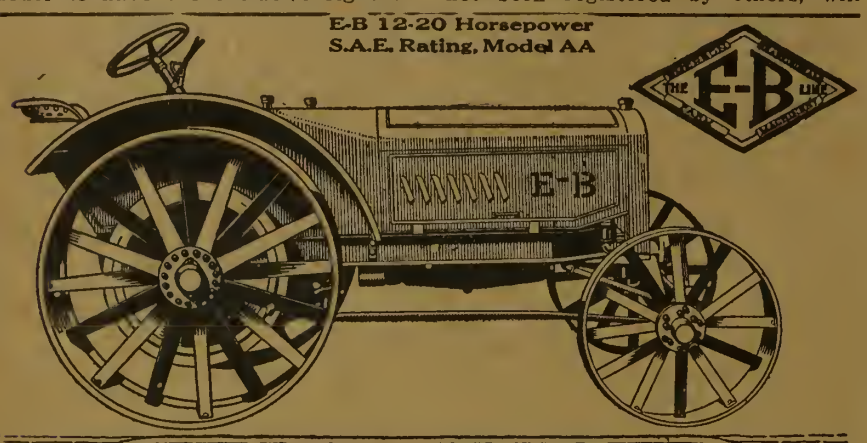
A subscriber is anxious to learn as to where he can purchase pure bred African geese and Cornish Indian games. Here seems to be opportunity for the up to date breeder.

U. S. GRAIN CORPORATION

The Food Administration Grain Corporation has been reorganized as the United States Grain Corporation, but is still under the directorship of Julius Barnes. Herbert Hoover has resigned as chairman of the board of directors and that position is now assumed by Mr. Barnes. The corporation's capital for handling the 1919 wheat crop is announced as $500,000,000. W. A. Starr is now in charge of the San Francisco office.

LABOR CAMP FOR SELMA

Definite plans are being made for the building at Selma in Fresno County of a model community camp for housing farm laborers. It is stated that Selma's packing houses give employment to 2,000 laborers and that with the demand for farm workers there is a labor housing need that cannot be met without a large camp



Only Pint of Water Per Day for Cooling

NO overheating even though you work the E-B 12-20 AA Tractor all day in tough going. That's because it has unusually large water gasket space, a gear-driven fan and a high-grade radiator of ample capacity. When other tractors of the same rating become overheated and stop work, this tractor is always ready to go ahead.

½-Ton Lighter Than The Average 12-20

Weighs 1000 pounds less than ordinary tractors of its rated power. Constructed almost entirely of steel. Furthermore, the E-B exclusive transmission on Hyatt Roller Bearings insures smooth, *complete* application of power.

Delivers 25 Per Cent Surplus Power

The rating of 12-20 is given to the E-B AA by the Society of Automotive Engineers—the most conservative rating known. As a matter of fact, this tractor possesses 25 per cent surplus power for emergencies—hard spots, hills, etc.

Any one of the family who can run an automobile, can operate an E-B AA. Its auto-type control and remarkable lightness for its power makes handling easy. All gears, including drive, run in oil and are absolutely protected from *all* dust, dirt and sand. Every part of the motor's driving mechanism is dust-proof enclosed. Ask your E-B dealer for complete facts.

Fence Law

What is the law in San Diego County in respect to fencing against outside stock?—Subscriber, Ramona.

There have been so many of these different questions in reference to fencing, that the writer has taken the trouble to look up the Statute of 1850 and 1855, which still continues in existence as to certain counties. The Statute of 1850 is presumed by the Code of Commissioners to be so in existence as to Amador, Klamath, San Diego, Santa Barbara, Siskiyou and Trinity Counties; it provides as follows:

Every inclosure shall be deemed a lawful fence which is 4½ feet high if of stoue; and if made of rails 5½ feet high; if made upon an embankment of a ditch, 3 feet high from the bottom of the ditch, the fence shall be 2 feet high, said fence to be substantial and reasonably strong and made so close that stock cannot get their heads through it; and if made to turn small stock, sufficiently tight to keep such stock out. A hedge fence shall be considered a lawful fence if 5 feet high and sufficiently close to turn stock.

If any horses, mules, jacks, jennies, hogs, sheep, goats or any head of neat cattle shall break into any grounds inclosed by a lawful fence, the owner or manager of such animals shall be liable to the owner of said inclosed premises for all damages sustained by such trespass, and if the trespass is repeated by the neglect of the owner of such stock, he shall for the second offence be subject to double damages sustained by the owner of said premises.

If any owner or occupant of any grounds injures any animal or animals breaking into or entering upon the grounds which are not inclosed by a lawful fence, or should kill, maim, or mutilate, hurt or injure any animal doing such injury, he shall be liable to the owner for all damages, and also all costs that may accrue in a suit to obtain said damages. The act of 1855 which is probably still in force as to the counties of Sonoma, Napa, Eldorado, and Marin, expressly excepts from its operation the counties heretofore mentioned as to which the Act of 1850 still applies. This Act of 1855 except as to counties heretofore mentioned has probably been repealed, although the wording of the repeal statute is very vague and is also complicated by provisions of the political code continuing in effect as to the laws relative to fencing, but the Act of 1855 merely defines what is a lawful fence in these counties.

A, B, C Farm

A owns a farm. His brothers B and C are in business with him; there is no written agreement between them. Now if A Should die without making a will, what will happen to this farm? If A should leave the farm in the name of himself and his two brothers, would A be required to pay corporation taxes? What form of a will should A make so that in case of his death the farm will go to his two brothers? Does a will need the signature of a notary public or seal to be valid?—A. B. C.

Assuming that A is unmarried, has no children, and that his father and mother are both deceased, the two brothers would then succeed to the property in equal shares in case of his death. A deed from a man to himself is not usually done, but in case the land were deeded to the three brothers it would hold as each having an undivided one-third interest in the land, and in the case of the death of only one, it would be necessary to administer upon his undivided one-third interest, which would be divided among his legal heirs. A very simple method to handle the matter would be for A to make a will, devising the farm to B and C in equal shares. A will which is entirely written, signed and dated in the handwriting of the testator needs no other signature or witness, but as to any other will, it is necessary that two witnesses sign upon the request of the testator asking them to act as witnesses in the presence of the testator and in the presence of each other.

FRUIT GROWERS OF CALIFORNIA INCORPORATE

A new cooperative association has been organized to market fresh fruits, particularly apricots, peaches and cherries. It follows the plan of operation of the California Prune and Apricot Growers' and will work with it, but will handle no dried fruit. J. H. Bone, San Jose, is secretary manager. Directors are: R. P. Van Orden, Mountain View; M. J. Madison, Haywards; C. C. Spaulding, Sunnyvale; J. J. McDonald, Milpitas; F. M. Righter, Campbell; H. N. Shroeder, Mountain View; W. J. Lean, San Jose; W. E. Moore, Berryessa; E. K. Glendenning, Campbell; L. E. Walter, Mountainview.

VALLEY FRUIT GROWERS OPEN IN DINUBA

The Valley Fruit Growers' Association will open an office in Dinuba, probably the coming week, in the Haden & Boone Building. The association will supply labor for fruit growers, members first, others afterward.

Dairy Council Organizes

At a meeting held in San Francisco, July 8 and 9 the California Dairy Council was organized on a permanent basis.

The California Dairy Council is a branch of the National Dairy Council, an organization that was brought into existence for the purpose of stimulating production and consumption of milk and milk products. Primarily the idea back of the national organization and each of the state units is to conduct educational propaganda to acquaint the consuming public with the absolute necessity of dairy products in the daily diet; to assist existing agencies engaged in educational work along production lines; to bring about a better understanding between the producer, distributor and consumer; to spread truth and counteract untruth.

Sam H. Greene, who has devoted the past few months in organization work for the council, outlined the aims of the organization as stated above and pointed out the opportunities for the council to render real service. Greene stated that it was not proposed that the council represent any one element of the dairy industry, but that it would be representatives of all. He showed that the interests of all were in common and that no branch could be affected in any way without affecting the entire business. Following Greene's outline of the aims of the Council, the afternoon and evening sessions of the first day were occupied with addresses by the following men: Thomas F. Hunt, dean of the college of agriculture, University of California; Geo. F. Eberhard, San Francisco; Senator E. S. Rigdon; H. E. Van Norman, dean University farm school; Dr. Wm. C. Hassler, San Francisco; H. Brown, Los Angeles; F. J. Cummings, Ferndale; Coleman Cox, San Francisco.

F. J. Cummings was elected president, George E. Platt of Los Angeles, vice president, and Sam H. Greene of San Francisco, secretary manager. The following men constitute the board of directors:

Breeders: A. W. Morris, Woodland; H. Brown, Los Angeles; Wm. H. Saylor, San Francisco. Producers: Hon. F. J. Cummings, Ferndale; John Denman, Petaluma; Ed. H. Webster, El Centro. Milk Distributors: D. M. Dorman, Los Angeles; C. A. Fieweger, Oakland; E. A. Green, San Francisco. Butter Manufacturers: Geo. E. Platt, Los Angeles; W. B. Hopkins, Petaluma; C. E. Gray, San Francisco. Cheese Manufacturers: C. C. Lester, Gilroy. Ice Cream Manufacturers: F. S. Calkins, Los Angeles; F. H. Ames, San Francisco. Condensed Milk Manufacturers: H. W. Low, Hughson. Bankers: Henry D. Swengel, Arcata. Dairy Produce Dealers: J. T. Freitas, San Francisco. Dairy Machinery and Equipment Dealers: J. N. Gilman, San Francisco. Associate Members: H. E. Van Norman, Davis; R. H. Whitten, San Francisco.

The next meeting will probably be held in October, at which time it is expected that a definite plan of publicity will be launched.

PATH

All persons interested in this demonstration are urgently invited to visit the place at once. It is particularly interesting to all who have silos. The merits of each sorghum and Indian corn are plainly indicated. Millets and grasses, too, may be seen in comparison.

It is a very valuable demonstration.

The Wonder Forage Plant excels all others fully two-fold, both in quantity and quality. Call at once and see it. Drive out West Sixteenth Street to the fifteen hundred block; or, take a red car marked "Hill & West 16th St." Be sure to take this chart with you; it is your guide.

YOUR INVESTMENT RETURNS 100% EVERY YEAR

Costs of modern farm equipment, as with other productive industries, must be figured with regard to the returns in profits. Some silos may have proven money losers; over 70,000 successful users of the

INDIANA SILO

back theirs as *money winners.*

To the extra meat and milk profits, and the saving of more expensive feeds, add the *extra savings* that the Indiana Silo makes for you in less spoiled silage. The total is your yearly profit on the Indiana.

The airtight, convenient Indiana doors (patented), the special Indiana tongue-and-grooving of the seasoned No. 1 fir staves, the proven Indiana method of holding the silo in shape and the walls tight and straight with adjustable iron hoops—these features keep silage in the Indiana free from rot, mould and freezing—make it more succulent and nourishing.

Without an Indiana you pay for one every year in less milk and meat profits. Why not have one next season? Now is the time to build and be ready.

Some Factors in Selection of Breeding Animals

By R. P. Royce.

FOR the man about to enter the business of producing pure bred live stock and who has carefully gone over the problem and decided that the business appeals to him and that his local conditions are such, or can be made such, as to make practical the venture, and who has thoroughly canvassed the situation and decided upon the breed on which he will stake his operations, the big problem remains of selecting the individual animals on which he will build his herd.

In a previous article the writer offered some general suggestions calculated to point out to the beginner a few practical steps to take in familiarizing himself with breed history, pedigrees, and breed type. The real test lies in successful application of such information when it comes to selecting and purchasing herd material, for the initial selections will in a large measure determine the success of the breeder.

Primarily one enters the breeding business for the same reason one enters any other business—for profit. Notwithstanding the fact that a few men take up live stock breeding as a pastime the great majority expect to make their operations pay. This being the case it is well for the beginner, and likewise many "old-timers," to keep constantly in mind the fact that utility is the essential in breeding. A breed or herd will stand or fall or progress to just the extent that its supporters recognize this fundamental fact and order their operations accordingly. The great arbiter of live stock merit is the practical farmer—and he is as cold blooded and merciless and decisive in his opinions as any judge in the universe. It is not difficult to call to mind certain cases where a number of our leading breeds have run afoul the farmer's judgment to their own misfortune. If pure bred live stock is justified, each breed must justify its claim for recognition by its efficient performance at the pail, the butcher's block, or in the collar, and the moment its supporters lose sight of this fact and go rainbow chasing in the realm of fancy points and pedigree fads to the exclusion of the real essentials it will be but a matter of time until they find themselves mired in the muck of public disapproval with nothing to show for their blind folly but a choice collection of pedigrees "that read well" and—say, "six white points" or some "solid reds."

We simply mention the above in passing, not because there is any real danger, but because beginners often fail to catch the true viewpoint in live stock breeding—they sometimes assume that the business is a sporting game, to be played by a few for their own pleasure, and that to be eligible to "sit in" all that is necessary is to own a few registered animals and thus be reckoned as "breeders." We would therefore repeat: Utility is the essential in breeding. If you are breeding beef cattle remember that it is beef that counts; if dairy cattle it is milk and butterfat; if hogs it is pork and lard; if sheep, wool or mutton or both. The true constructive breeder is the man who recognizes these facts and keeps them to the front in his effort to produce the greatest efficiency and who at the same time succeeds in producing such efficiency combined with that degree of conformation and refinement that stamps the work of a master. He is the man whose name on a pedigree means something.

The last statement brings up the question of the value of a pedigree in live stock improvement. A pedigree may mean much or little; a recorded pedigree—the same. A pedigree is nothing more or less than an accurate record of the sires and dams, together with their owners and breeders, responsible for the individual for which the pedigrees is issued. Obviously then the value of a particular pedigree is entirely dependent upon the value of the animals appearing therein and the reliability of the men appearing as owners or breeders. If a pedigree discloses the fact that back of the individual is a long line of carefully selected ancestors that have seen service in the herd of one or more recognized breeders it is rather probable that the animal under consideration can be regarded as valuable when compared to one, the pedigree of which is but a record of matings of little or unknown sires and dams owned in herds of men of slight prominence. It is for this reason that a careful study of breed history is urged in order that one can recognize such animals and breeders when considering a pedigree. One of the most dangerous and at the same time one of the most common mistakes made by beginners—and in some instances by breeders of more mature experience—is the tendency to become faddists in the matter of pedigrees. Pedigree fads are the most dangerous rocks in the course of breed improvement Not only have breeds been almost destroyed by having faddists at the helms, but many are the herds (not confined to any one breed) that have gone down because the owner set his sails to catch the force of a fleeting breeze of "popular bloodlines" without due regard to the essentials.

The only justification for any line of breeding becoming popular is the fact that that particular line has proven and continues to prove a source of efficient animals. And whenever the time arrives that such blood lines do not produce profitable and acceptable individuals there is absolutely no reason why that blood should continue in favor simply because it was one time of value. In weighing the value of a pedigree it is of the highest importance that first of all it belongs to a good individual, one that is representative in every way of the modern type. It is then important that the pedigree be founded on a strong base of good blood and merit, but it is vastly more important that the top crosses, the dames and sires and grand dams and grand sires, be meritorious than that the sires and dams of the more distant generations possess merit if the top crosses have little to recommend them. One swallow doesn't make a summer, neither does one famous sire or dam in the extreme upper or lower right hand corner of a pedigree insure merit in a living animal.

On the other hand it is equal folly for the beginner or the established breeder to ignore the pedigrees of the animals he puts into his herd. In every breed there are certain lines of breeding that are deservedly popular

because of the fact that they have been built up through generations of careful selection by master breeders who have succeeded in firmly establishing the more fundamental essentials. Animals with pedigrees that have been proven and with high individuality are the basis on which successful herds are founded, and for that reason they are sought after by discriminating breeders and their values are established accordingly. In founding a breeding herd every effort should be made to select such animals for the reason that offspring produced in a herd so founded at once command better values and are the object of an active demand. The beginner should therefore endeavor to familiarize himself with the better producing bloodlines and not be content with any of less value. A fair criterion to go by is to make selections from herds that have been before the public for a period of years or from newer herds that have been established along lines suggested above. The very fact that a herd has existed for a number of years is evidence that it must be producing a reliable sort of stock, else the lack of patronage accorded it by the buying public would have caused its dispersal in one way or another.

In selecting foundation animals the beginner will do well to keep on the lookout for dispersal sales. It is rare that an established breeder will consent to part with his best and proven producers, either bulls or females, for the reason that he knows such animals represent his real capital. Occasionally though, a breeder desiring to retain certain offspring is forced, through lack of room, to offer such animals for sale, and the beginner can count himself fortunate if he has the opportunity to buy such animals. Other opportunities are sometimes offered when a breeder, desiring to make a special attraction in his sale, decides to offer a few of his more valuable producers. The above is written with more particular regard to females for, as a matter of fact, proven sires are quite often forced on the market because it is no longer practical to retain them in the herd on account of keeping their daughters. But the beginner's real opportunity comes when an old and successful herd is thrown on the market at public sale. It is then that he has an unrestricted opportunity to purchase the cream of the herd, and such opportunities can not be overlooked.

Los Angeles County Cow Testing Association

The Cow Testing Association of the Los Angeles Farm Bureau is now planning for Dairymen's Day to be held sometime this fall. The plan is to make a great day in dairy and farm bureau circles. Meantime the cow testing association is increasing in usefulness and showing dairymen wherein lies greatest profit. Adviser Hodgson writes:

"Out of a total of some 1034 cows tested last month 240 are on the honor roll, which means producing 1000 pounds of milk, or 45 pounds of butter fat, during the month. So much interest has been manifested in our cow testing work that a new association is now in process of organization, and within two or three weeks we expect to have the two associations well under way. The Orange County farm bureau has joined with us to form this second association. We find the dairymen in this county very much interested in weeding out the boarders and improving their herds generally."

The table showing production of various herds indicates one herd, Number 10, which has 63 cows in the honor roll. Noteworthy is the fact that in this particular herd there is a total of 93. Another herd, Number 7, has a total of 196 cows of which 86 are on the honor roll. Of the 1034 cows in the association 240 are producing over the 1,000 pounds of milk, or 45 pounds of butter fat.

Commenting on the performance of the cows during June Cow Tester Knight says:

"It shows a wide variation in the average butter fat production per cow in the 15 herds under test, as well as considerable variation in the gross returns per cow. An equally great variation is to be seen in the net profit per cow above cost of feed, a variation which shows no great correlation with the average butterfat production. In other words, some of the higher producing herds are not making as much profit per animal as some of the lower producing herds where more careful feeding is the rule. There is a general correlation however, between cheap feeding cost and low profit per animal, indicating that good feeding pays. Of particular note, however, is the fact that the average of the five highest cows is very much above the general average for the herd, indicating that there is still considerable room for improvement in weeding out the poorer producers. A source of considerable gratification is the large proportion of honor roll individuals to the total number of cows tested, 240 to 1034. A considerably larger number of cows is signed up for testing, several of the larger herds in the association not being represented in the table on account of not being ready for testing this month. The highest individual tests of the month were a Jersey from the Burr Creamery with 94.8 pounds of butter fat and a Holstein from the County Farm with 85.7 pounds butter fat. The County Farm herd still continues its remarkably high performance.

EXCURSION COURSE IN ARIZONA

A field course in range livestock production is announced by the college of agriculture of the University of Arizona to begin on August 4 and continue for five weeks During the time students will be given a good knowledge of the actual conditions affecting livestock production on Arizona ranges.

The first week will be spent at the university, where a detailed survey will be given of the entire subject. The remaining four weeks will be spent in studying the methods of range livestock production as conducted by some of the best stockmen in Arizona. Federal foresters will assist.

In connection with this field course the second annual state tour of the "Livestock Squad," arranged by the agricultural extension service, will be held. Public meetings will be held at Patagonia, Oracle, Skull Valley, Williamson Valley, Flagstaff, Springerville, Fort Apache, Fort Grant, Wilcox and Benson.

The schedule is: August 4 to 9, University of Arizona, Tucson; August 11 to 16, Santa Cruz, Pima and Pinal Counties; August 18 to 23, Maricopa, Yavapai and Coconino; August 25 to 30, Coconino, Navajo and Apache; September 1 to 6, Gila, Graham and Cochise.

This course is offered to male university students, practical stockmen and students and instructors in other institutions.

DEPENDABILITY

OF THE

DE LAVAL

Now that "dog days" are with us, it is no time to bother with a balky cream separator.

Dependability in a cream separator is especially necessary in the summer when the milk should be taken care of in the shortest possible time.

The DE LAVAL Cream Separator is dependable, and with ordinary care it will easily last a lifetime.

The DE LAVAL capacity rating is dependable. Each size exceeds its advertised capacity under ordinary, and even under unfavorable, conditions.

DE LAVAL Service is dependable. Fifty thousand agents the world over see to it that DE LAVAL Separators are properly set up, operated and taken care of. And, above all, the De Laval Company is dependable—the oldest and by far the largest cream separator manufacturers in the world.

More DE LAVALS in use than of all other makes combined

See the local De Laval Agent, or, if you don't know him, write to the nearest De Laval office as below

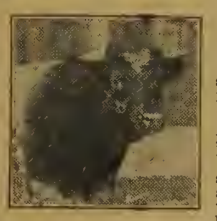
We offer for this season:
25 Head Ram Lambs.
50 Head Yearling Ewes.
100 Head of Ewe Lambs.
1 3-year-old Butterfield Ram.
10 Head purebred Rambouillet Rams.

Apply to or address:

D. E. Kelliher Eugene, Cal.



At 400 county fairs in this year, 1919, the owners of 400 Shorthorn bulls will walk out of the show rings with a championship ribbon of royal purple fluttering in the breeze and 25 good, hard dollars, tucked away in their pockets — $10,000 in all. Better get your bull ready.

And when the show season of the year has closed a total reaching well up toward $300,000 will have been distributed among Shorthorn exhibitors as prize money.

It pays to grow good Shorthorns. Pure-breds pay the best.

American Shorthorn Breeders Association
13 Dexter Park Ave., Chicago, Ill.

Save Labor By Using Holsteins

Whatever the amount of milk or butterfat you wish to produce, is it not better policy to use large yield cows than to feed and shelter the necessarily greater number of small yield cows?

Use Holsteins and you save labor, feed, stable-room, equipment and risk. They are always healthy and ready for work.

Choose cows according to their capacity for converting coarse feed into milk. That is the function of a dairy cow and that is where the big Black and White Holstein excels.

Grand Hampshires

At Public Sale

Wednesday, Aug. 6th

Santa Barbara, Calif.

Sixty-five bred sows and gilts selected from the $25,000 foundation herd, representing the choicest lines of breeding.

The Hampshire Hog is the Farmer's Hog

They are prolific, good mothers, excellent rustlers, quick maturing. Because of their high quality and ability to kill out high, *Hampshires* are eagerly sought after by packers. If you want to make real money in hogs—raise *Hampshires*.

An unusual opportunity for securing foundation breeding animals.

Sale will be held on the ranch located in *Montecito,* four miles east of Santa Barbara. Free transportation from Santa Barbara.

Sale starts at 1:00 P. M.

Francis T. Underhill, Proprietor — **O. U. R.** — Thomas T. Dinsmore, Manager

Ortego-Underhill-Rancho Registered Hampshires

Shropshire Sheep

August 2, Butte City Ranch, Butte City.

Scribner Returns

F. H. Scribner who recently went to the Middle West to purchase dairy animals for Los Angeles, San Bernardino, Riverside and Orange County dairymen has returned. Likewise four cars of heifers have been received. Mr. Scribner's instructions from dairymen were in effect to secure young cows bred to freshen this fall, and with a limitation on price. This limitation prevented the general purchases anticipated. Two carloads of young Jerseys and one car of Holsteins were received by Riverside dairymen, and one carload of young Holsteins was purchased for San Bernardino dairymen. All the animals came across in fine condition.

Get Your Bull Ready

At 400 county fairs throughout the United States this year there will be offered for Shorthorn bulls championship prizes, $25 at each fair, a total of $10,000. Why don't you get your bull ready and try and land the championship at your county fair? This prize is offered as a special by the American Shorthorn Breeders' Association. This association has appropriated $100,000 for Shorthorn prizes for the current year at fairs and shows in all parts of the country. As most of this is based on the fairs and shows giving double the amount it will result in a total not far short of $300,000 to be offered as cash prizes for Shorthorns this year. Nothing like this has ever been made available for prizes for any breed before. It is in line with the broad policies which the Shorthorn association is working out.

First California Hampshire Sale

On August 6, Francis T. Underhill will hold the first public sale of Hampshire hogs to be made in this state. The sale will be held at his ranch in Montecito. The Underhill herd was established something over a year ago by the purchase of some of the highest priced Hampshires ever brought to California. Mr. Underhill, who has large holdings in Santa Barbara County, made a most painstaking investigation of the various breeds of swine and says that his conclusions led him to determine to handle this breed. The offering to be sold next month will consist of 65 head of bred sows and gilts that have been carefully selected from his high priced foundation herd. Walter Folk, a representative of the Hampshire Record Association, is now at the Underhill ranch preparing the offering for sale. Secretary E. C. Stone is expected to be present and an effort will be made to organize a strong state association for the purpose of pushing the breed in this territory.

Secures Imported Shorthorn Bull

Shorthorn interests will be interested to know that Edward Cebrian of San Francisco, who maintains one of the largest herds in the West on his ranch near Sacramento, has secured the great imported bull Caledonia from Anoka Farms, Waukosha, Wisconsin. Caledonia was imported by Carpenter and Ross of Mansfield, Ohio, and sold in their June 1917 sale to F. A. Gillespie and Sons of Oklahoma for $7000. When the Gillespie herd was dispersed last December Frank W. Harding of Anoka Farms and secretary of the American Shorthorn Breeders' Association purchased him. Caledonia, a roan, was calved May 16, 1916. He was bred by Wm. Anderson of Aberdeenshire, Scotland, and was sired by the great Duthie bull Proud Emblem and his dam is Rosewood 105th, by Newton Model. He is counted one of the most valuable imported bulls in service in America. In addition to Caledonia, Cebrian has purchased from a Canadian breeder the bull Gainford Matchless, a son of Gainford Marquis. Gainford Matchless was first as senior yearling at the last International. Bringing such bulls to California should mean much to the breed and it is expected that they will be given wide opportunity in the Cebrian herd

Hopland Shorthorns to Conaway Ranch

While at the Carruthers sale, C. Harold Hopkins, manager of the Conaway Ranch Company, Woodland, stated that he had closed a deal for the entire herd of Shorthorns maintained by A. W. Foster of San Francisco. This sale marks the passing of one of the best known California herds.

Buys 90 Ayrshires

Bailey McFarland of Steybrae Farms, San Mateo, arrived at Auburn July 13, with the largest shipment of Ayrshire cattle ever brought West. The shipment consisted of 90 head and is to be divided equally between McFarland and the Penobscot Farm Company of Cool, El Dorado County. The cattle were shipped from the East by express and required three cars. Detailed mention of the shipment will be made later.

Berglund Buys Johnson Durocs

In a recent letter from Frederick M. Johnson, Napa, he states that he has sold his entire herd of Duroc-Jerseys to Harvey M. Berglund of Dixon. In commenting on the sale he says: "Mr. Berglund's herd consisted almost entirely of hogs of our own raising and now with the addition of my complete herd he has one of the largest and best herds in the state. This sale does not mean that I am retiring from the business. To the contrary, I expect to visit Nebraska herds this fall and buy a carload of as good Durocs as I can find."

Anchorage Farm's New Herd Boar

In their new boar, Champion Value 10th, recently purchased from E. J. Barker, the well known Berkshire breeder and judge, Mrs. Hardy, manager of Archorage Farm, Orland, believes they have secured the right blood lines for mating with the daughters of their famous sire Star Leader. This new boar is a litter mate to the sire of that famous Berkshire sow champion Lady 4th, shown by Hamilton Farms, Gladstone, New Jersey, in 1916, and grand champion at seven of the big Eastern fairs, the National Swine Show and International Live Stock Exposition, Chicago. Star Value, one of the greatest boars the breed produced, sold at public sale for $4000 and was largely responsible for the great success of Mr. Barker as a breeder. The mingling of this blood with that of Star Leader should leave a lasting impression on the Berkshire breed in this state. Anchorage Farm has recently sold to Harvey P. Goodman, Walnut Creek, a bred sow and a young boar; to C. A. White, Lincoln, a boar ready for service; to Mrs. E Tremourieux, Fair Oaks, a boar; to Rodney Savage, Halsey, Oregon, a boar and a son of Star Leader to J. H. Hay, Sacramento.

A Whiz-Bang Boar

The Poland-China breeder, J. H. Cook of Paradiso, has sold his ranch and expects to locate in the vicinity of Sacramento. However, until the new location is secured, he will maintain his herd at its present location where he is busy preparing his show herd for the fall shows. Mr Cook

expects to show in all classes for sows, senior and junior boar pigs, and in both futurities. He is paying particular attention to his young sire Whiz-Bang, named by a soldier just returned from France who has considerable experience with the whiz-bang shell. This boar is by Forrest View Bob by Caldwell's Big Bob, and so well is he thought of by Mr Cook that he has eight sows bred to him for early fall farrow. The spring pigs from which he expects to select a part of his futurity candidates are in a thrifty condition and are by such boars as King's Big Bone Leader, Cook's Hancherdale Jones and Giant Bob.

News From Key Duroc Herd

H. P. Slocum and Son of Willows have abandoned the idea of holding a public sale this year due to the depletion of their herd by the heavy demand for bred sows and gilts. Their boar, Sensation Wonder 1st, will be included in their show herd this season and is a litter mate to Mammoth Sensation by Top Sensation owned by Dan Kane, Wisner, Nebraska, and for which Kane refused $2500. Mammoth Sensation was first as junior yearling at the Nebraska state fair last year and is the sire of Mammoth Sensation 2nd recently purchased by W. R. Gatton for the Diamond Bar Ranch at the published price of $3000. Owing to their inability to secure help on the ranch they are undecided as to just what shows they will make but present plans include the state fair at Sacramento, the Oregon state fair and the California International Live Stock Show in San Francisco. Recent sales are three bred gilts and the second prize boar at the Oregon state fair in 1918 to J. W. Atterbury, Woodland; two bred gilts to Durham Colony and one to Frank J. Tetreau, Red Bluff.

Keep on Jerseys

In the recent record breaking sale of Jerseys held by Ed Carey, Carlton, Oregon, Dr. W. H. Hand of Orland, added to his present herd of Jerseys the cow St. Mawes Susy Olga with a record of 698.51 pounds of butter fat. This cow is one of five sisters all of which have made fine records. Dr. Hand states that the five owners will endeavor the coming year to place these five cows in the gold medal class. A four months old son of this cow sold in the same sale for $1550. He also secured in the same sale the heifer St. Mawes Rosalind, a daughter of Poppy's St. Mawes and bred to Rosaires Olga Lad. The doctor has arranged with an experienced herdsman to handle his herd the coming year and expects to make some high records. He has recently sold two well bred young cows of show quality to Ross Flintzer, Anderson, and two young heifers to Fred C Steiner, Haywards. The Hand herd will be seen at the fall shows.

Shows Value of Pure Bred Hogs

The breeding herd of pure breds on the Mills Berkshire Farm, Hamilton City, has recently been worked over and the least desirable weeded out and the herd reduced to 130 top sows and 30 gilts. All animals not coming up to the standard required for the pure bred herd were placed in the grade herd for the production of pork James Mills, Jr., manager of the ranch, states he had a very striking example of the value of pure breds for pork production. In a recent shipment of two cars to the market one car was made up entirely of grades and the dressing per cent was 73.4. The second car contained 15 pure bred Berkshire barrows and according to a letter received from the packer these 15 Berkshire barrows increased the dressing per cent of the second car to 78.8. The two cars were practically of the same age and weight and had been fed in the same lot. Mr. Mills states that they now have on the ranch 1550 head of hogs of all ages and that just as rapidly as possible all grades will be discarded and replaced by pure breds. R. J. Ramsey, recently a student at the University Farm, has been placed in charge of the swine department, and from the foundation already laid expects to be able to develop one of the largest herds of pure bred Berkshires in America. The herd boars in use at present are Ames Rival 70th, the grand champion at the 1918 state fair; Winona Compton Champion 8th by Laurel Champion, the sire of more first prize winners than any other living Berkshire boar; Improver 2nd by Improver B and Penrith Lustre 1st by Penrith Champion, a boar that won several grand championships for his breeder Chas. Talmadge.

Yates Will Not Show Polands

Owing to the scarcity of labor which has prevented him from giving his show herd the attention necessary to properly fit it, R. J. Yates breeder of Poland-Chinas, Orland, has decided not to show this fall. It had been his intention to have a complete herd at the leading fall shows and he regrets that he will be unable to do so. He states, however that he may bring his junior sire and some young animals to the state fair just to let the people know he is still in the game.

LOS ANGELES LIVE STOCK SHOW

While Los Angeles has definitely decided not to hold a general fair it has been decided to hold a live stock show at State Exposition Park, Los Angeles, October 18-26. The show is to be financed by live stock men and business men of Southern California and with sufficient liberality to guarantee a thoroughly representative Western live stock show. Chas. R. Thomas has been chosen as secretary and manager. The directors are: E. W. Murphy, Fred H. Bixby, Harry Chandler, Frank Wiggins, Irving Hellman, Harold Braly, Walter P. Story, Clinton E. Miller, H. A. Jastro, L. M. Cole, F. E. Lewis, 2d, Chas. H. Hill, H. B. Woodill, Geo. M. Brown, Walter M. Ross, Frank Simpson, W. I. Hollingsworth. The officers are: E. W. Murphy, president; Clinton E. Miller, first vice president; Walter P. Story, second vice president; C. R. Thomas, secretary and manager; Irving Hellman, treasurer. Executive committee: Fred H. Bixby, Frank Wiggins, H. A. Jastro, Chas. H. Hill, Harold Braly.

The premiums so far offered aggregate $33,000. It is thought that many additional offerings will be made within the next few weeks, this largely from directors of breed or record associations. Mr. Thomas has opened offices at 128 South Broadway, Los Angeles, in the building of the Los Angeles Chamber of Commerce.

H. C. Witherow, Mgr. Live Oaks, Sutter Co., Calif.

Carruthers Shorthorns Break Records

By R. P. Royce

Pacific Coast, and Western, Shorthorn values were materially advanced last week at Sacramento, when W. M. Carruthers of Live Oak, sold 39 head for $31,985, an average of $820. The sale not only established a new record for Western Shorthorn sales, but established a record for all breeds of beef cattle heretofore sold on the Pacific Coast or in the Western states. In addition to the above, the selling of the top female, Countess Lavender, to the Conaway Ranch for $2050 established a new record for females of the beef breeds sold in any California or Western sale.

The sale had attracted a great deal of attention and as soon as the quality of the offering became generally known, it was a foregone conclusion that new values were certain to be established. Carruthers, who has long been identified with Shorthorn interests on the Pacific Coast realized that there was a genuine demand for Shorthorns combining the better sort of bloodlines and high individual excellence, and having the courage of his convictions he assembled an offering that at once lifted the sale from the ordinary. The large and representative crowd of breeders and others interested in cattle improvement was a splendid tribute to the enterprise displayed by the seller, and the prices they were willing to set serve to indicate the advancing and solid progress the breed is making in this state and should serve to encourage a wider expansion of activity on the part of other California Shorthorn breeders.

The sale which was held at the state fair grounds was opened by the auctioneer, Col. Fred Reppert of Indiana, assisted in the ring by Scotty Milne of Missouri. Professor Gordon H. True of the University of California made a few remarks touching the general live stock situation. He was followed by W. A. Cochel, Western representative of the American Shorthorn Breeders' Association, who told of the opportunities open to Shorthorn breeders and discussed the basis for values now obtaining in all classes of live stock.

The sale started with the selling of the great three year old cow Broadhooks Sultana 2d to Edward Cebrian of Sacramento at the very conservative price of $1500. Throughout the sale, which was conducted in perhaps shorter time than any previous California sale of like caliber, there were a number of rare bargains obtained, but on the whole prices were highly satisfactory.

One of the disappointments of the sale was the lack of appreciation accorded the white bull, Hallwood Villager. It had been hoped that breeders of this state would regard his selling as an opportunity to strengthen their herds, but at $2700 he became the property of the noted breeder, J. W. McDermott of Missouri. California has too few such bulls that she can afford to lose their services. He was the only bull sold.

The 38 females sold were quite the most attractive lot offered in any Western sale, and the ease with which they were absorbed was a keen source of satisfaction to all.

The top price paid for a female was, as noted, $2050 paid by C. Harold Hopkins, manager of the Conaway Ranch, Woodland. This firm selected four of the choicer females. Lady Ruberta, the white daughter of Ruberta's Goods was purchased by Reppert for L. E. Morse and Son, Caldwell, Idaho, for $1800. Mayfield Victoria 2d, a red two year old daughter of Count Glory was one of the top buys, going to Wm. Bond of Newark at $1850. Senator B. F. Rush secured the richly bred Ravenswood Lady 3d, at $1000. H. M. Elberg made a number of critical selections, securing among other the good cow Red Queen 4th, at $800. Ormondale Company paid $1300 for Avondale's Gypsy. Paul R. Sims, Gait, paid $1125 for Overlooks Bloom. George E. Diersen was the heaviest individual buyer, securing ten head, among which were a number of exceptional bargains.

The sale was under the management of C. L. Hughes of the California Breeders' Sales and Pedigree Company, and adds another record sale to the long list established by that organization.

Mayfield Victoria 2nd

A richly bred two year old daughter of Count Glory, purchased by Wm. Bond of Newark for $1850.

The detailed report follows:

Bulls

Hallwood Villager, Oct. 1915; J. W. McDermott, Kahoka, Mo., $2700.

Females

2. Broadhook's Sultana, June 1916; Edward Cebrian, Sacramento, $1500.
3. Lady Ruberta, Sept. 1916; L. E. Morse and Son, Caldwell, Idaho, $1800.
4. Roan Lavender, Nov. 1917; J. F. Dunne, Gilroy, $625.
5. Avondale's Gipsy, Mar. 1917; Ormondale Co., Redwood City, $1300.
6. Cumberland Girl, Sept. 1916; Pachero Cattle Co., Hollister, $525.
7. Countess Lavender, Sept. 1917; Conaway Ranch, Woodland, $2050.
8. Stamp's Victoria, April 1917; Conaway Ranch, $950.
9. Ravenswood Lady 3d, Oct. 1917; B. F. Rush, Suisuin, $1000.

33. Live Oak Florence, Sept. 1918; George E. Diersen, $310.
34. Live Oak Queen, Sept. 1918; George E. Diersen, $310.
35. Red Emerald 2d, Sept. 1917, and C. C.; H. M. Elberg, $650.

Countess Lavender

Sold to Conaway Ranch, Woodland, for $2050, the record price for a female of any beef breed sold in California or the West.

36. Overlook's Bloom, Aug. 1914, and C. C.; Paul R. Sims, Galt, $1125.
37. Mistress Maria, Nov. 1916; Conaway Ranch, $1025.
40. Eveline 5th, Mar. 1914, and George E. Diersen, $525.
41. Mayfield Rose 2d, Apr. 1917; Butte City Ranch, $210.
43. Henrietta, Mar. 1912; George E. Diersen, $525.
44. Maggie Murphy, June 1914, and C. C.; George E. Diersen, $525.

RING SIDE REFLECTIONS

It was a hot sale from start to finish—the auctioneers could not be convinced that the thermometer registered less than 130 degrees—Milne brought his overcoat, too!

Judging by the character of the four females selected by C. Harold Hopkins of the Conaway Ranch, at an average of $1200 each, they intend to give their bull, California Model, purchased at the spring sale at Davis for the record price of $5500, an opportunity to prove his ability. This firm contemplates establishing one of the top herds of the West. They now own the highest priced bull and female sold in the West.

No Shorthorn sale would be possible without that veteran breeder, Senator B. F. Rush of Suisuin, but those looking for the choicer things would just as soon he would stay away as he always makes them pay full values—and it is pretty generally conceded that he can spot value as keenly as any one. He selected a particularly valuable lot in Ravenswood Lady 3d, one of the choicest bred females of the whole offering and in calf to Lord Julian, crack son of Lord Avondale one of the best breeding bulls in America.

J. F. Dunne of Gilroy who is starting a herd made a number of carefui selections aided and abetted by C. N. Hawkins of the Pacheco Cattle Company, Hollister Hawkins, who is president of the California Shorthorn Breeders' Association, and one of the largest breeders in the West, makes a highly satisfactory mentor for anyone.

When Henry M. Elberg of the Roselawn herd at Woodland and his herdsman Carl Johnson start bidding it is a good cue that something choice is in the ring—and they usually get what they go after. In the sale they got three of the best bred females in the offering. Elburg will make a sale of Shorthorns October 16, at Woodland.

One of the most critical buyers at recent Shorthorn sales is Wm. Bond of Newark. Bond has greatly strengthened his herd in the past year and apparently is determined to have as good as the best—and he knows how good the best are. He made a particularly fortunate selection when he got the corking good Mayfield Victoria 2d.

James M. McDonnel, manager of the Ormondale Company, Redwood City, was out after the good ones, and got one in Avondale's Gypsy, a Dustin Gypsy Maid sired by Avondale's Heir—and another in Lancaster's Snowball, a very sweet and breedy cow with a clinking bull calf at foot by Rockwood Monogram.

Master John Elmo Montgomery of Davis, accompanied by his father, is becoming a familiar figure around Shorthorn auctions. He made his start at Davis last spring and followed it up last week by assisting his father select the good cow, Lady Grace and the junior yearling heifer, Live Oak Fashion.

George E. Dierssen of Sacramento made his entry into the Shorthorn ranks with quite a pronounced splurge. Dierssen selected ten head and it is doubtful if any buyer got more for his money.

W. S. Guilford of the Butte City Ranch, Butte City, was the most persistent bidder at the sale. Billy started nearly every lot at good stiff figures and continued to bid until he reached his limit. He secured two head. If every breeder was as strong a supporter and booster for Shorthorns as Guilford the breed would be farther advanced than it is. Guilford will sell Shorthorns, Berkshires, Shropshires and ponies at the ranch, August 2.

Visitors at the sale had an opportunity to meet Col. Ed. Patterson of Missouri. The colonel is manager of the famous Ravenswood herd at Bunceton. That herd is the oldest in existence and has been responsible for many of the best cattle the herd has produced. Colonel Patterson is a gentleman of the old school and past master in the art of cattle breeding.

Scotty Milne, one of the greatest authorities in America on Shorthorn pedigrees acted as ring man. Scotty has been identified with many of the greatest Shorthorn herds of this country. For years he was with the George Bothwell herd in Missouri, later with the world famous Tebo Lawn herd. He was with the last herd at the time of its disposal when the mighty Choice Goods, and the balance of that wonderful collection were sold. Milne has been identified with more famous Shorthorns than perhaps any other man.

The directors of the state board of agriculture met the day of the sale and attended the auction. President Roeding and Secretary Paine stated that the board was anxious to stimulate the live stock industry in every way—and particularly welcomed the holding of pure bred sales at the fair grounds.

Don't Let Your Stock

Lose their early Summer Gain through neglect now

Pasture is getting short. Your animals must go on dry feed—hay and grain. It's a big change from the succulent, nutritious grasses of summer which supply the needed laxatives and tonics.

Keep your animals' bowels open and regular—drive out the worms—keep their blood rich—keep their digestive apparatus in order—by feeding Dr. Hess Stock Tonic.

A Conditioner and Worm Expeller

Don't allow your stock to "get off feed" and in a rundown condition. Dr. Hess Stock Tonic eliminates waste and gives appetite, good health and good digestion. It enables animals to get the most benefit out of their feed.

Buy Stock Tonic according to the size of your herd. *Here's a suggestion for your guidance:* Get from your dealer 2 pounds for each average hog, 5 pounds for each horse, cow or steer, to start with, feed as directed and then watch results.

Why Pay the Peddler Twice My Price?

You buy Dr. Hess Stock Tonic at an honest price from a responsible dealer in your own town who guarantees it, and who refunds your money if it does not do as claimed.

25-lb. Pail, $2.50 100-lb. Drum, $8.00

True to Manage the San Francisco Live Stock Show

The board of directors for the California International Livestock Show to be held at San Francisco, Nevember 1 to 8, have announced that Professor Gordon H. True, head of the animal husbandry division of the University of California, has acccpted the management and secretaryship of the event. The announcement will be looked upon with great satisfaction by all the live stock interests of the West as the selection of Professor True at once insures that every detail of the show will be conducted on the highest possible level and to the interest of all.

It is doubtful if any man in the West, available for the management of such a show, has a wider or more intimate acquaintance with live stock affairs than True. True first came West over 15 years ago and for a number of years was connected with the University of Arizona. Later he was in charge of the animal husbandry department of the University of Nevada, and while at that institution his work was of such a character that he was offered the place he now holds with the University of California. His work in this state is too well known to all to require mention. Since coming to California he has been largely responsible for the rapid development of the live stock industry and his faith in the possibilities of California as a live stock state has been justified by the sensational exhibits from his institution at the International Live Stock Exposition.

Prof. Gordon H. True

The success of California animals in competition with the world has served as an inspiration to breeders throughout the West.

True believes that live stock shows play an important part in live stock development — not merely as shows for breeders, but as powerful educational factors. Believing thus, True is planning to establish the San Francisco show on broad policies and hopes to make the show more than a San Francisco or even a California show.

The show is backed by ample financial resources, and the board of directors consists of some of the biggest men in the West. The management has been fortunate in securing the California Building as a home. Offices have been established in the Lachman Building and True expects to issue the classification and premium list at an early date.

The University of California has generously granted Professor True a five months leave of absence.

BIG SALE AT BUTTE CITY RANCH

The next big event on the sale calendar will be the second annual auction sale to be held at Butte City Ranch, Butte City, on Saturday, August 2. Butte City Ranch, which is owned by W. P. Dwyer and W. S. Guilford, is developing into one of the important breeding establishments of the Sacramento Valley.

The owners who have large interests in Northern California have long recognized the value of better live stock in the general scheme of development and have undertaken to produce at their ranch a class of live stock that will prove profitable Herds of Shorthorn cattle and Berkshire hogs as well as a large flock of Shropshire sheep are maintained, and the surplus is offered the public through the medium of auction sales. The forthcoming sale will consist of 12 head of registered Shorthorn bulls and 38 females. As a whole the lot represents a very desirable collection of useful cattle, a number of which represent blood lines that have long

A scene at the Llano Vista Farm of F. A. Langdon at Perris, California. These pure-bred Hampshires are being fattened with "Quick-Fat."

been popular in this state. The offering has been selected with special regard to the needs of the beginner. The sale will include 125 head of Shropshire sheep, perhaps the largest single offering of Shropshires ever sold in California and they are of a character to attract a wide range of shepherds, from the small flock masters to the larger range operator. Butte City Ranch has been identified with Berkshire swine for so long that today Butte City Ranch claims the distinction of being instrumental in making Glenn County the Western Berkshire center. A few nicely broken Shetland ponies will be included as a special attraction for the children. It is expected that the sale will attract one of the largest crowds ever attending a California auction.

EUROPE BUYING AMERICAN HORSES

In a letter sent out recently by Wayne Dinsmore, secretary of the Percheron Society of America, he comments on the European demand for American work horses. Mr. Dinsmore says in part:

"Decided improvement in the horse market is manifest. Exports to Europe have already begun, despite very high ocean rates. Marx and Hammel have forwarded three shipments to Havre, France, part of which were billed directly to Belgium via Havre, as the port of Antwerp is not yet available. Vanlandengham, of Belgium, who formerly acted as interpreter for many Americans purchasing pure bred horses in France and Belgium, has begun buying horses on the Chicago market and expects to ship at least 100 per week. Another firm, the identity of which has not yet been disclosed, will begin July 7, so that from the known arrangements of these three exporting firms, from 400 to 500 horses will be purchased and shipped abroad each week from Chicago alone. St. Louis will undoubtedly be in the game soon, so that farmers may look for a good demand for surplus drafters.

"The Marx and Hammel consignment of 200 head which left Chicago July 1 were a good useful lot of work horses, ready for immediate service. All were broken and most of them right out of farm work. They ranged from 15.3 to 16.3 hands in height, and from 1500 to 1800 pounds in weight, in good working flesh. The majority were geldings, but mares are just as acceptable, or a little more so. The best type of draft horses is wanted, but the less desirable ones are accepted at a discount in price. Harry McNair, in commenting on this, said: 'It is easier to sell a real good drafter for $300 than a mediocre one for $225.' Horse row comment credited the cost price of this last lot of 200 head at $265, average on the Chicago market, which means a cost of about $240 each in the country. There were a number of horses in the shipment which cost over $300 per head and a good many that did not cost over $225, for the spread between the good ones and the medium kind is great.

"The horse that is most sought for is the one that will stand 16.3 to 17 hands, with depth of chest equal to one-half his height, and well proportioned throughout. Such a horse must be strong backed, powerful in build, deep middled and well let down in the flanks, with good underpinning, and weigh over 1700 pounds in working flesh. Such horses will bring from $325 to $350 each. Short, steep pasterns, small constricted feet or crooked hocks are not wanted, and unsound horses are also declined with thanks, although a slight puff about the joints will get by if the horse is otherwise sound.

"One fact of especial interest to farmers is that the exporters will take the mediocre stuff if they can not get the best. No man can afford to sell the best if he expects to improve his horses. It is therefore good policy to cut out all of the smaller, less desirable work horses, and dispose of them as buyers appear; and they will come more and more frequently, for there is a steadily growing demand for drafters for city and construction work, as well as for export. Shrewd judges of the market predict that by 1921 good draft horses will be higher in price than ever before: and then, five years too late, there will be a frenzied stampede of farmers to breed their mares and with this will come a widespread demand for good stallions, which the pure bred horse breeders of America must meet."

Imp. Scottish Lord

The Shorthorn bull calf purchased by T. S. Glide, Hillcrest Farm, Davis, in the record breaking Carpenter and Ross sale held at Chicago. Scottish Lord is a red junior yearling bred by Robert Anderson of Aberdeenshire, Scotland. He was sired by Lord of the Ring and his dam is Bright Bess of Collynie (Imp.), a Marr Bessie bred by Wm. Duthie and sired by Knight of Collynie. It is expected that the addition of such a bull will add much strength to the Hillcrest herd.

The California Tractor and Implement Association recently met in San Francisco and discussed matter of selecting permanent secretary, forms of order blanks, future demonstrations, and giving punch generally to the whole farm power campaign.

Butte City Ranch

Owned by W. P. Dwyer and W. S. Guilford

Butte City Glenn County California

Second Annual Sale

Saturday August 2, 1919

50 Registered Shorthorns

38 Females—12 Bulls

These Shorthorns present a splendid selection for the breeder who wants to found a registered herd with modest investment. They are of uniformly good type, in excellent physical condition, and are sired by Victor Stamford, Vermillion, Gloster Archer, Roan Chancellor, Crescent Dale, Gibson's Goods, Ringleader, Sir Type, and other bulls of approved breeding.

There are choice cows with calves at foot, bred heifers, and a very desirable lot of open heifers. All of the bred females are in calf to the Butte City Ranch herd sire Victor Stamford, who is by one of the best sons of Whitehall Sultan and out of a Stamford dam.

Every Shorthorn sold as a single lot is guaranteed to be a breeder, and is tuberculin tested; every young animal permanently immunized against blackleg by Purity Blackleg Aggressin made by the Kansas process.

125 Registered Shropshires

35 Mature Ewes—40 Ewe Lambs
35 Yearling Rams—20 Ram Lambs

This is the first time within the history of public sales in California that buyers have had an opportunity to buy such well bred registered Shropshires of splendid type at public auction. The offering is in high class condition throughout, and represents Broughton, Cavendish, Minton, and Wardwell breeding, the best obtainable. The owners of Butte City Ranch have selected some of their very best Shropshires for this sale, for they believe that nearly every farm in California can profitably own a farm flock, and that the foundation should be of the best.

50 Registered Berkshires

The Berkshire offering is composed of a choice selection of gilts and young boars, in thrifty, vigorous condition, well grown and of the breeding and type that will meet favor with buyers on sale day. An outstanding feature of the offering is the uniformity of breeding. Every animal in the sale is sired by a son of the world's famous imported English boar Epochal, or by a grandson of the world's grand champion boar Grand Leader 2nd. Besides this the animals in the sale are out of some of the very best breeding sows ever owned at Butte City Ranch.

Every Berkshire in the sale is permanently immunized against hog cholera by Purity Hog Cholera Serum and Mixed Vaccine.

10 Shetland Ponies

Scores of youngsters have been made happy by the purchase of Shetland Ponies from Butte City Ranch, and the owners have selected some of their very best for this sale.

Shade in the Henyard

By Jean A. Koethen

CHICKENS, both young and old, like the sun. On even a very hot day you may see them stretched out in the hottest place in their run, enjoying a sun bath. Possibly this liking for an ocasional soaking in the sunshine has led them to be misunderstood by some of their friends, for nothing is more trying to all feathered creatures than exposure to the sun at all times. In our climate protection from the sun's rays is a vital part of the equipment of a poultry yard.

Three kinds of shade may be provided for hens; that which any poultry house furnishes, inside and out; that which may be artificially provided by the use of cloth or lumber; and that furnished by growing things. The last is so much more desirable than either of the others that the first two may be dismissed with a word.

A poultry house, unless it is fitted with removable windows that abundant circulation of air may be secured in hot weather, may be shady, but it is hot. To force hens in an excessively hot spell to crowd into the house for shelter is to invite disaster. In ordinary weather they may manage fairly well, but when that trying annual hot wave comes and the mercury runs up to 108 or 110 degrees, reports of casualties are only too general.

Circulation of air, with green shade, is the only thing that saves hens in such weather. In that June hot wave two years ago a near neighbor of mine lost a dozen hens out of a backyard flock while my own were fit as ever the next day. What was the difference? Merely that hers were in a small house and run with a high board fence on the windward side, while mine were under pepper trees with all the breeze there was blowing through.

It is possible to build shelters which protect the flock from the actual rays of the sun. Burlap or canvas stretched on four posts is often recommended. The objection to all such shelters is that they do not prevent the radiation of heat from the ground that is not shaded, and the hens have not only to endure this radiation, which is considerable from a light-colored soil, but are forced to go into the sunshine whenever they desire to move about. In a yard shaded by trees there is no radiation, the occasional unshaded patches of ground can be easily avoided, and, best of all, the breeze, as it draws through under the trees is cooled as much as any outdoor air can be.

This cooling effect of heavy shade is more obvious in winter than in summer. On the lot adjoining our home stands an immense live oak with a spread of nearly 50 feet. In summer this is a wonderful place for chicks. In the spring all coops must be placed so far from it that they receive no morning or late afternoon shade. If they do the chicks are chilled. A brood of late chicks is making very rapid growth in its shelter now. They are hardly in the sun from morning till night. Not all of us can have live oaks for summer shade, but we can plant peppers or if we object to them, walnut, fig or some of the smaller deciduous trees.

Peach, apricot and plum trees are not altogether satisfactory for chicken yards, though far better than nothing. Their shade is not as dense as chickens like in the hottest weather, and it is difficult to keep the birds from roosting in them, to the great detriment of the crop. I have never had a walnut in a chicken yard, but two planted near the fence help shade the yard and I have never seen the chickens that were privileged to range under them try to roost in the branches or those of a fig. We made the mistake of planting both peppers and peaches in our chicken runs, and while the shade is all that could be desired, the peppers have killed out the peaches. The orange gives a fine shade for chickens and the branches offer less inviting perches than do some other trees. I hope the day will come when a flock of hens will have the run of every orange grove in Southern California.

We have tried a good many vines on chicken fences. Those that were carefully protected from destructive beaks grew; those that were not protected did not last long. After more than one rose had been nibbled off till it finally gave up the struggle, it was with a good deal of satisfaction that we saw a climbing Cecil Bruner reach the top of the fence. Once up, its troubles were over. Honeysuckle is the most satisfactory vine I have tried. It covers the fence, gives a good deal of shade and asks only a start.

Where fruit trees are not desirable the castor bean makes a good shade. The plants are not as easy to start as one would suppose, but when they get a start they are there to stay. It is sometimes objected that they are poisonous, but this is not a valid objection, for chickens have too much sense (or is it instinct?) to touch them.

It is quite generally agreed after some years of bickering that utility and fancy qualities can be successfully combined in the same bird. If this is true, is it not equally true that poultry yards can be made beautiful as well as useful? Must hens always choose between bare yards or none at all? A bare, glaring yard is not a pretty place, even when it is clean, and who can count the bare, filthy, unshaded poultry yards in this state of ours? Why not fill them with trees and cover the fences with vines? In a land where it takes only a little labor and a little water to make any tree or vine grow, why not make all our backyards and henyards and barnyards beautiful I cannot believe but that even chickens will thrive better for beautiful surroundings and the shade Nature meant them to have.

TEST EGG PRODUCTION AT UNIVERSITY FARM

During the six weeks' poultry short course beginning September 29 at the University of California Farm, Davis, various methods for testing for egg production will be shown, it is announced by Dean Thomas Forsyth Hunt of the college of agriculture.

One of these tests, known as the color test, and based on the theory that the bright yellow color in the shanks of yellow legged fowls fades out in proportion to the number of eggs the hen lays, is said to be of great value in culling out the slacker hens in July and August.

Careful investigations conducted by

VAILE-KIMES
WATER SUPPLY SYSTEMS

If pays for itself Quickly

When you buy a water supply system, don't buy a cheap assembled makeshift. A V&K Water Supply System will pay for itself in a short time. A cheap system is a constant expense, a constant bother and disappointment and, in the end, is much more expensive than a V&K would be.

MAKE YOUR HOME MODERN

You should have a first class water supply system. It will make your home modern. It will make it a fine place for you and your family to live. It will save you hours of time and will add years to your life, and the lives of your wife and children. Health and happiness come with it.

Write now for the V&K book that tells all about water supply systems. It will help you in choosing one for your home and your work.

Sign and mail the coupon.

2 and 4-wheeled
AUTO WRECKERS
1450 Central Ave. Los Angeles

Fresno County is planning for her district fair September 30 to October 4.

the poultry division of the University of California college of agriculture are declared to show that in all yellow legged fowls, such as Leghorns, Plymouth Rocks, Wyandottes and Reds, the yellow color in the shanks, beak, ear lobes and skin slowly fades out as the number of eggs increases during each laying season. While this method is not as accurate or as expensive as trapnesting, flocks of layers can be culled quite accurately by the use of this color test in connection with other physical indications, according to poultry experts.

A HOME-MADE CHICK COOP

A clever design for a backyard chick coop is shown in the accompanying cut. It consists of a coop 30 by 36 inches to which is attached a wire run 36 by 48 inches. Both coop and run are one foot high. This coop is so light that it can be moved daily to clean ground. As will be seen from its height, it is not designed to accommodate a hen, but is useful for a small brood of hand-raised or brooder chicks. A home-made brooder used with this coop is made of a large tin can, cut in two in the middle to make of suitable height for the coop. A door is cut in one side, and the chicks are kept warm by a hover made of strips of outing flannel tacked on a round board.

SCIENTISTS DISCOVER RARE FISH

Fish and game commission experts are discovering fish hitherto unknown on the Pacific Coast. Fish looking more like worms than fish, square-headed fish and flying fish are among those discovered for the first time.

Deep in the seclusion of the Long Beach laboratory with nothing but the murmur of the ocean to disturb their operations, Will F. Thompson and Elmer Higgins, well known fish experts, have been busy identifying specimens of various fishes secured by the new patrol boat "Albacore," which is making a scientific investigation of the Southern California fisheries. For example, one rare fish which recently came into the laboratory was a specimen of Tetragonurus cuvieri Risso, which these experts termed "The Squarehead" for lack of a better name. This fish was found near Catalina and is according to reports the first of its kind found in North Pacific waters. Although we hear this species mentioned as a rare fish existing in the Mediterranean by the naturalist Rondelet as early as 1554, and although since that time it has been taken several times in the Mediterranean and near the Madeira Islands, yet never before has it been caught off the western coast of North America. In her finely meshed nets, the "Albacore" has taken a specimen of Stylophthalmus paradoxus, a native of the Indian Ocean, also a member of the genus Trachypterus (king of the salmon), which is supposedly very rare. Nor did the Exonautes rondeletii, a kind of flying fish, formerly found only in tropical seas escape the "Albacore's" nets. She also obtained from the deep a species of sandab hitherto confined solely to Mexican waters.

The best thing to say when you have nothing to say is to say nothing and stick to it. It was Chuck Connor's policy when in doubt to "say nothin' to nobody about nothin'."

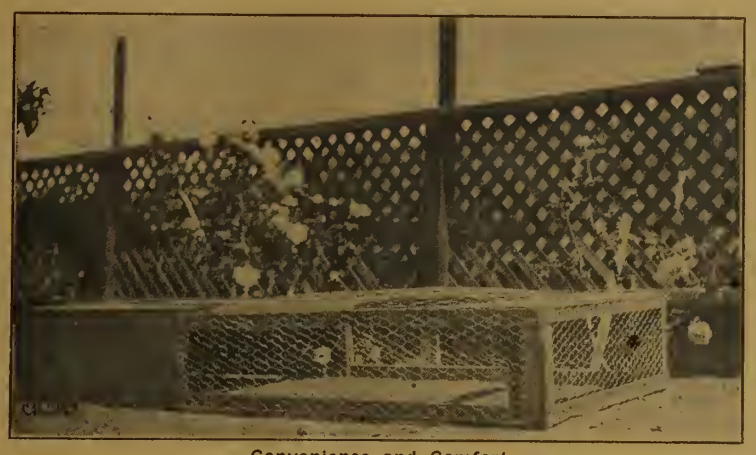
Be careful how you jump at a conclusion. It may knock you down.

INTEREST IN LAND SETTLEMENT COLONY

During the last six months the state land settlement board has been receiving at its Berkeley and Durham offices, from 20 to 40 letters a day asking for information about the state land settlement act, to know what progress has been made in the colony at Durham and when and where settlers, and especially soldier settlers, can obtain farms.

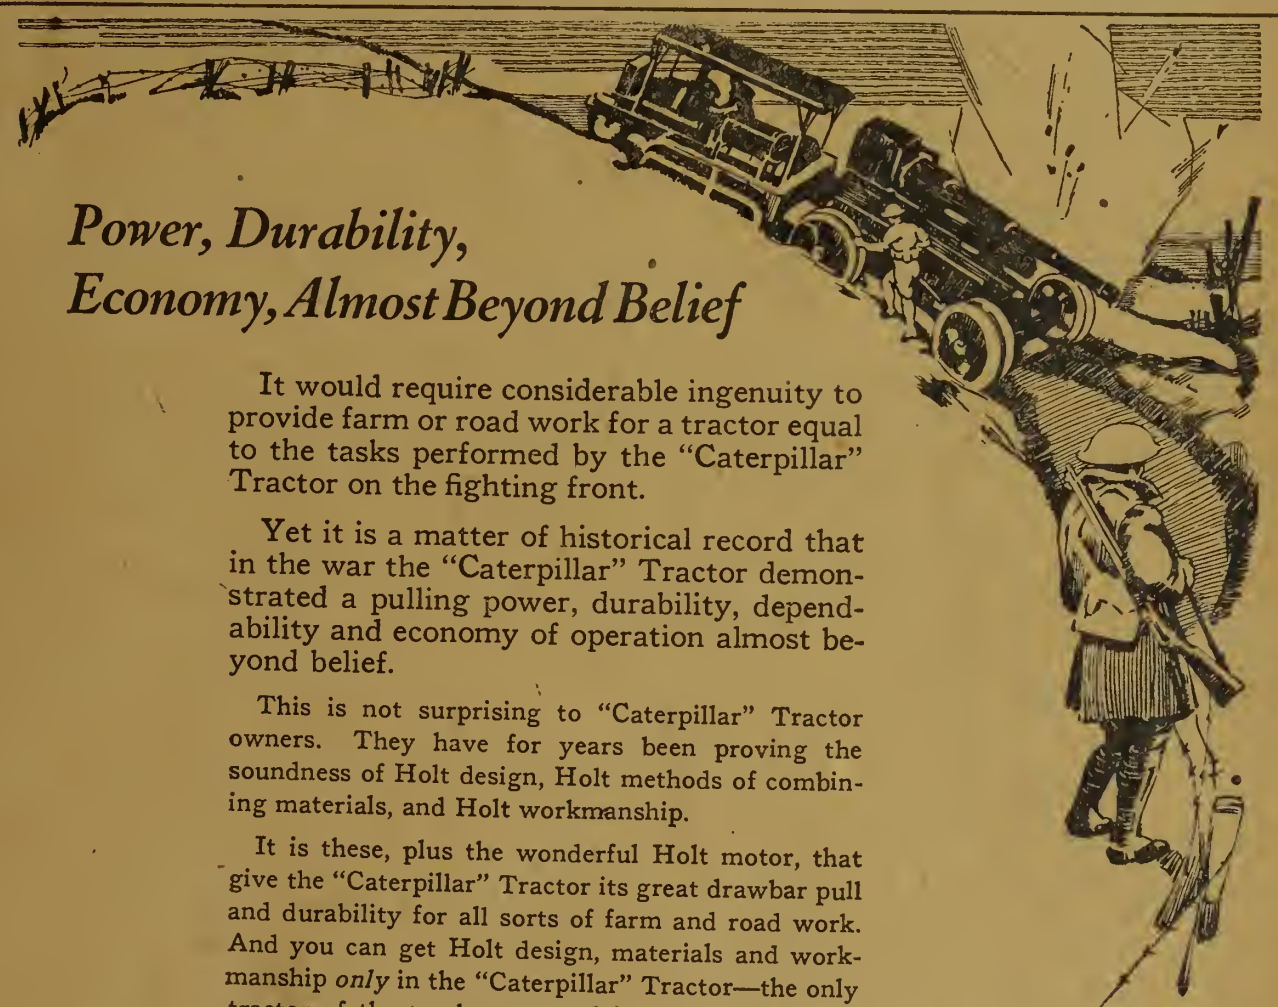
The interest in the act has been increased by the agitation for similar legislation by congress and in other states. State officials from ten other states and from several foreign countries have visited Durham and, without a single exception, have made favorable reports on both the settlement policy which this act embodies, and on the development which has taken place under it. The correspondence has now become so heavy that the board has prepared a statement which gives the history of the board's operations and the progress of settlers up to date and outlines the plans for the future. It is accomplished by a map showing the subdivisional plan, soil map, and is illustrated by a number of views of houses and works on the settlement.

It appears that the appropriation of one million dollars for continuing settlement work does not become available until August and the board cannot until then officially invite offers of land, but it is examining all lands offered informally and will be glad to do this so that it can proceed with the purchase and development of a new area as soon as possible. Among the offers thus far received, the most important is from the Northern California Counties Association, which offers from 10,000 to 40,000 acres in Lassen County, 20,000 to 40,000 acres in Modoc County, 10,000 acres in Shasta County and 20,000 acres in Siskiyou County. Offers of three areas have also been received from the San Joaquin Valley.



Convenience and Comfort
This chick coop is easy to handle and warm in cold weather.

The alfalfa meal mill at Kerman, Fresno County, is now busy grinding.



Power, Durability, Economy, Almost Beyond Belief

It would require considerable ingenuity to provide farm or road work for a tractor equal to the tasks performed by the "Caterpillar" Tractor on the fighting front.

Yet it is a matter of historical record that in the war the "Caterpillar" Tractor demonstrated a pulling power, durability, dependability and economy of operation almost beyond belief.

This is not surprising to "Caterpillar" Tractor owners. They have for years been proving the soundness of Holt design, Holt methods of combining materials, and Holt workmanship.

It is these, plus the wonderful Holt motor, that give the "Caterpillar" Tractor its great drawbar pull and durability for all sorts of farm and road work. And you can get Holt design, materials and workmanship *only* in the "Caterpillar" Tractor—the only tractor of the track-type used by the Allies in the great war—chosen and proved by severe and prolonged tests.

Get your "Caterpillar" Tractor now. Send for Catalog 403.

GOVERNMENT LAND

300 Million Acres of "Free" land in U. S. "The New Homeseeker" a 104 page book WITH MAPS and ILLUSTRATIONS, showing millions of acres of vacant public homesteads, timber, mines or grazing lands. Founded on historical facts. DOES NOT MISLEAD. Read warnings "official," eliminates crooked land agents. Tells the whereabouts of government land in Arizona, New Mexico, Nevada, California, Idaho, Oregon, Montana, Washington, Utah and Old Mexico. Describes water, soil and climatic conditions, all the principal U. S. land laws. A marvelous publication, just off the press. Mailed anywhere, $2. Address "THE HOMESEEKER," Dpt. M, 3rd floor Grant Bldg., Los Angeles, California.

IS COOPERATION WORTH WHILE?

Continued from Page 51

them who are getting ten cents per pound so that after all the average cost of the outside packer and the average price of the outside grower is far less than 10 cents per pound. As a matter of fact, the present price of ten cents per pound, from an industry point of view, means nothing at all. There are at least three packing firms who could buy all of the raisins that are still unsold in the state of California for 25 cents per pound and not materially affect their financial standing, and it does not take a very courageous man to offer ten cents per pound when he knows there are no sellers and it is the judgment of the writer that there is not a single concern in the business today who would buy 10,000 tons of raisins at 10 cents per pound without knowing what the association prices are going to be. In fact less than a week since the writer, in response to an inquiry from one of the independent packers, offered to sell them 10,000 tons at the same price they were paying the growers, which was ten cents for Muscat raisins in the sweat box. The matter was referred to the head office in San Francisco and the answer came back that they would not be willing to buy the raisins unless the association guaranteed the price. In other words it is the old familiar proposition worn threadbare in this community that you can walk out into the rain with impunity as long as you have a friend who is willing and able to hold an umbrella over you, but in the past this phrase has been applied to the outside growers only, now, however, it seems that even the packers, who boast so much of their superior knowledge and great financial ability, are not averse to standing under the umbrella also.

And finally we are appealing to you as growers for your wholehearted support given in an ungrudging way. This is your organization and as it prospers you will prosper, and when it fails you will fail, and your support is needed as much in the hour of prosperity as in the hour of adversity. You cannot build an organization on lawsuits and liquidated damages, but the undivided loyalty of the 9,000 growers with whom we now have contracts will make our position impregnable. A little over a year ago 9,000 of us banded ourselves together with a common purpose and entered into agreements, each with the other, to do a certain definite thing for six years, and certainly these agreements that were entered into then with such enthusiasm are not now to be thrown aside as mere scraps of paper. It is still our opinion, as it was then, that if the whole of life were to be measured by a money standard that the contracts are worth while and if lived up to with fidelity will make the San Joaquin Valley the richest valley in the world, but there are things in life so much better than money that we do not care at this time to use that standard, and our appeal to you is to do right for right's sake, as absolutely the finest thing in life is an untarnished name and we do not believe that the growers of raisins will barter it away for a mess of pottage.

CALIFORNIA BEANS

A special investigation of bean production has just been concluded by the United States bureau of markets. This covers all varieties of beans in all bean growing states.

California's acreage of all varieties in 1918 was 592,000, the largest of any state in the Union. Michigan was a close second with 543,000 acres. Then came Colorado with 252,000, New York with 200,000, New Mexico 149,000, Idaho 43,000. The total acreage for the United States was 2,050,000.

California's 592,000 acres in 1918 produced 8,584,000 bushels of beans, while Michigan with almost as much acreage, 543,000, produced only about half as much, 4,887,000 bushels.

As to varieties in California, Limas, of course, lead with 33 per cent (includes Henderson Bush, 2.6 per cent). Next came Small White, 19 per cent; Pink, 14 per cent; Large White, 12 per cent; Red Mexican, 3 per cent; Cranberry, 2 per cent; Bayo, 2 per cent; miscellaneous, 15 per cent.

COLORADO BEAN GROWERS PROTEST

Colorado bean growers have found that the name "Pinto" is being applied by many dealers to any imported bean, whereas it properly applies only to a distinct variety of Colorado bean.

Therefore the Colorado State Farm Bureau has registered formal protest addressed to the Colorado Bean Growers' Association and the United States bureau of markets. Also it protests "against the policy of the United States government in purchasing any foreign beans as long as there is any considerable quantity of home-grown beans not marketed."

ENGLAND HEAVY BUYER OF CANNED FRUIT

English buyers are making large purchases of 1919 canned fruits, but they are not waiting for that fruit to eat; they are buying all they can get hold of of the 1918 pack. In April England secured shipment of $1,544,182 worth of canned fruits, $523,433 worth being peaches.

The California Cooperative Canneries are under the management of R. W. Crary and Vernon Campbell. James Madison of San Francisco has resigned as president.

We are, many of us, fooled by what men say, and we find out what they mean often when it is too late.

The fellow who waits for something to turn up has his eyes fixed on his toes.

Do Your Hauling with an Auto-Wheel

Don't strain your back pushing a heavy load on a wheelbarrow. Get an Auto-Wheel Coaster. You can move a big, heavy load with ease, with speed.

And when through working, you can have worlds of fun playing with your Auto-Wheel. It's a speedy, classy Coaster, as well as a sturdy Roadster. Has genuine roller bearings, oval spokes and steel axles and tires. If you're a REAL boy, you're going to insist upon an Auto-Wheel.

Want a Beautiful Felt Pennant?
Write us the names of three coaster-wagon dealers, mentioning which one handles the Auto-Wheel. We'll send you beautiful booklet, showing Auto-Wheel Convertible Roadster, too. Write TODAY. Address

The Latest Plant for Farm Light and Power

Now you can get the plant that you long have wanted—one to furnish ample light and dependable, flexible power. This 40 light Fairbanks-Morse "F" outfit is quality all the way through—simple in design—exceptional workmanship and materials. Low speed engine, ball bearing dynamo—assure long life, less attention—lower maintenance cost.

Plant comes completely mounted on base and includes our famous "Z" throttling governor engine which can also be used to drive a cream separator, washing machine or churn, independent of the dynamo, either direct or through a line shaft. Instrument board is conveniently mounted over the dynamo and the simple construction throughout provides for a touch of a button to start and stop. We consider this new "F" plant the greatest value in the farm lighting field—and you get the added advantage of mechanical power. Your nearby dealer will further explain all details of the "F" outfit and demonstrate conclusively the many features your plant should have.

THE SLEEPYTOWN EXPRESS

Just beyond the rainbow's end a river ripples down
Beneath a bridge, around a bend and flows through Sleepytown—
Through Sleepytown, where goblins toil to fashion wondrous toys
And make up fascinating games for little girls and boys.
And automobiles, just the size for little hands to drive
Await to whirl you all about as soon as you arrive.
But no one ever is allowed in Sleepytown unless
He goes to bed in time to take the Sleepytown Express!

I know a foolish little boy who always starts to whine
When he is asked to trot upstairs before it's half-past nine.
And often he will stamp his feet and shake his tousled head,
And make a racket, even then, when he is sent to bed.
Of course, when he has said his prayers it always is too late
To catch the Sleepytown Express — it starts at half-past eight,
And so, in all his long, long life—he's five years old this fall—
That little boy has never been to Sleepytown at all.

But other wiser little boys, and little girls as well,
As soon as 8 o'clock has struck rush right upstairs, pell-mell,
Get off their clothes and say their prayers, just of their own accord.
And, when the train comes rolling in, they're there to climb aboard.
Then, through a long, delightful night they wander up and down
And have a most exciting time in queer old Sleepytown;
And not for cake or anything that children could possess
Would any of them ever miss the Sleepytown Express.

—James Montague.

METHODS OF CLEANING

THE day of manual "help" seems to be past; the day of mechanical equipment is surely here. Housekeeping, perhaps more than any other business, has been slow to claim the help of mechanical aids. But more and more it is coming to be a case of necessity, not of choice, to find some means of accomplishing more work, more quickly and more effectively by fewer people—and generally by just one, the housekeeper. Perhaps some day the housekeepers will cooperate, as the grocers, the laundrymen, the ice men, the furniture men, the gardeners, and all the rest have done, but at present, as in the past, they are strictly in the position of workers and givers and sometimes it seems as if the whole world outside were the takers. The good days of "give and take" seem far in the future. Meanwhile we will have to do some taking for ourselves.

A guide book to the busy housekeeper has been printed by the Oregon agricultural college, written by Ruth McNary Smith. We have decided to give it to Cultivator house keepers entire, for while many, perhaps most, of its suggestions are already common knowledge, yet they will serve as reminders and a timely urge to avail ourselves of the help we may have for the taking.

* * *

Since the entrance of dust and dirt into a house seems unavoidable, and the housewife must spend so much time in merely keeping things clean, it is important that she be able to do this work as easily and quickly as possible.

General Equipment

Through the use of better equipment, a more systematic plan of work, and better methods, housework is losing much of its drudgery. It is difficult to care for a house properly without undue fatigue if the antiquated cleaning equipment found in most homes is used. In spite of the increasing use of machinery in every field of labor, women continue to be handworkers. The broom, dust pan, and mop, supplemented perhaps by a carpet sweeper and a hand washing machine, are certainly not adequate when used for the great variety of cleaning necessary in the average home. For example, in considering the broom from the standpoint of efficiency, it is evident that it can not be used with equal success on polished floors, rugs, linoleum, and matting. Originally designed to remove such coarse refuse as paper and sticks, it will not serve as well to remove the finely pulverized dirt found most commonly on the floors of the house. It is also evident that the broom merely redistributes a great deal of this dirt, much of which may be inhaled by the worker, and hence it can not be considered a sanitary means of cleaning.

The carpet sweper is useful in a limited way, in removing threads and lint from carpets and rugs, but fails to remove the quantities of dirt and dust carried onto the floor of a house. Recently a large number of so called "vacuum cleaners" operated either by hand, water, or electric power, have been offered for sale. These machines are designed so as to remove dirt from floors by suction into a dust bag, the mechanicism for producing this suction being of various types, that is, bellows or revolving fans in the lower-priced hand and power machines, pumps or turbine blades in the more expensive power apparatus. Some of these cleaners are very efficient, removing practically all the dirt from rugs and carpets in a dustless manner. Others are fairly satisfactory, while a great many are not worth buying because they are not based on a correct mechanical principle. There are really no good electric cleaners of low price, but there is a hand machine which removes dirt very well through suction produced by a bellows, and lint and threads by means of the brushes attached to the back. Some women might find this a little heavy to push over a carpet but it would certainly be less laborious and more sanitary than sweeping. Of course a machine run by electric or water power is much more desirable than the hand-run variety.

To remove dust and lint from a bare floor or around rugs, the oiled or dustless mop is very useful. The price of these mops is low.

Other examples of useful and medium-priced cleaning apparatus are the string mop, pail with mop wringer attached, cleaning brushes of various kinds, the dustless duster easily made at home according to the directions given later, and a chamois skin for cleaning windows.

For Laundry Work

There is probably no kind of house work so utterly fatiguing and back breaking as the laundering of clothes, usually because there is so little to work with, and the arrangement is so poor that every part of the process requires enough stooping, lifting, and carrying to exhaust a strong woman.

When there is plumbing, stationary tubs should be considered as necessary as a bath tub, or a sink. Those made of cement and covered with zinc are moderate in price. Tubs should be placed high enough to make stooping unnecessary, even if pipe is used for supports instead of the legs furnished. If the separate galvanized iron tubs are used, a base should be provided of the correct height.

Many hand washing machines are unsatisfactory because of the labor required to run them, the difficulty of keeping them in repair, and their doubtful efficiency. However, it is possible to purchase cheaply a simple suction apparatus. The lever and clamp for adjusting to the tub are most desirable. Excellent water power machines having a wringer attached to be run by the water motor as well may be bought for a little more. The electric machines are splendid, as a rule, but more expensive than those metioned. In general, that washing machine is good which cleans by means of the rapid passing of air and water through the clothes, rather than by any process of rubbing, twisting, or other motion likely to cause wear on the fabric.

Glass washboards wear better than metallic ones and if the grooves are not too sharply defined, injure the fabric less.

Copper boilers or block tin with copper bottom are more economical in the end than tin.

A securely built, collapsible ironing board is desirable. The same style may be simply folded against the wall and can be easily made by riveting the brace onto an ordinary board and hingeing it to the wall on a narrow shelf.

The weight of irons should suit the user; if too light, much extra pressure is required to smooth the clothes. Those covered with asbestos hold the heat better than the older type. An alcohol iron which burns wood alcohol as a fuel may be used where the electric one is impossible, but care should be used in its selection.

The electric iron is an economy in many ways and wherever electric power is obtainable should replace the old fashioned sad iron. In selecting an electric iron the following points should be considered.

There should be no exposed asbestos.

The porcelain plug should be well protected.

When the current is turned on, the bottom of the iron should feel uniformly warm to the hand; if hot in any spot scorching is more likely.

From six to eight pounds is a comfortable weight.

The voltage marked on the iron should be near that of the current in use.

Cleaning Materials

The housewife, formerly, used soap and sapolio for almost all kinds of cleaning, without much regard as to the qualities of the different kinds of surfaces with which she was dealing. There are a great many materials and compounds now offered for sale to suit every form of cleaning. Many of these mixtures are good, others are no better than one or two of their important ingredients used alone. Every dwelling should have a cleaning closet in which to hang mops, brooms, etc., with shelves for cleaning material where they may be stored together in labelled bottles instead of their being scattered through the house. The simple cleaning aids listed below cover the necessities but commercial compounds may be added.

Kerosene, ammonia, bath brick, rottenstone, whiting, turpentine, gasoline, washing soda, oxalic acid crystals, borax, alum, chloride of lime, boiled linseed oil, paraffin, soap (white laundry, naptha, cold starch, bluing, wood stain. (To make an oxalic acid solution add 3 oz. crystals to 1 pt. of water and allow to dissolve. Bottle and cork well. Label the bottle "Poison").

Schedule of Work

System in doing work is just as important as good equipment, and the housekeeper whose duties "are never done" is often one who never stops to plan out her work to save time, nor tries to prevent unnecessary steps by thinking ahead. Of course where there are small children it is much more difficult to organize the work well than where the family consists of adults. At first thought it may seem that housework is so varied, and made up of so many different duties that it would be almost impossible to make a list of these duties, much less assemble them into a definite program. Probably every woman has some working plan according to which she bakes on one day, washes and irons on another, and cleans at the same time each week. With some housekeepers this plan is practically unchangeable, and Monday being wash day is used for that purpose, even though another day might temporarily, at least, be more convenient. It is time for each housewife to decide whether her plan of work has been adopted because it is the most convenient and least tiresome to her or simply because a similar plan has been her mother's custom. It is possible to save much time for more important things by fitting in the work of the day so as to save unnecessary walking. Many people have found it helpful actually to write out a program of work for a week, seeking to systematize as much as possible.

(Next week "Methods of Work.")

Summertime

There is no lyric can surpass
Morning wind in orchard grass
That dips and swells and dives along,
And winnows out a silver song
Of sun and air and orchard grass;
This no lyric can surpass.

There is no epic that can be
Half so epic as the sea
That chants in caverns green and old
A story that is never told,
Of cities dead and ships at rest,
And moons that rode upon her breast.

—June Bookman

"STAMPED AND SELF-ADDRESSED"

"And that was what she said!" declared Mary, trumphantly. "Didn't I tell you last night, Uncle Jim, that Mrs. Barnes was a horrid, disobliging woman, and that I knew it wouldn't do the least bit of good to ask her to help?"

"Why, yes," said Uncle Jim, slowly, over the top of his newspaper. "If I remember correctly, you did say something like that. Well, then, congratulations, my dear. That's another stamped and self-addressed envelope come back."

"Congratulations?" said Mary. "I guess you didn't understand. I said that Mrs. Barnes had turned out just as horrid and disobliging—"

"As you expected her to be," finished Uncle Jim, briskly. "Yes, I understand. I merely connected it with something I heard the other day. Every day we send out mental messages all round us; and we always inclose a stamped and self-addressed envelope, which brings us in return something of the same nature as the one we dispatch—what we sent for, really!

"I don't believe in swallowing things whole, you know, and so I've been watching myself and my own reactions—and I'm getting a good deal of amusement out of them. There's one newsboy, for example, just outside my office building who, for some reason, has seemed to take a particular fancy to me. Whether I buy or not, he always give me a specially cheery greeting. Of course, I soon began to send him back a special greeting, too, though it wasn't until recently that I realized it was in his own self-addressed envelope.

"And there's one of my clients who always comes to me as if he thought I knew everything about the subject in hand. I'd do almost anything rather than disappoint that man and shake his confidence. That's what he draws in his envelope.

"And there's another person—did you ever experience that kind, Mary?—who looks me over critically from head to foot when I begin to talk. There's nothing in the world, as far as I know, that dries up the springs of one's inspiration like that critical stare. I am just as stupid as that person expects me to be! And I send back her envelope."

"Why, that must be why everybody loves mother so!" cried Mary, eagerly. "She brings out the best in people. I've heard people say so again and again. That's because she looks for it, isn't it? And probably that's why she gets on so well with Delia. Lots of other people have tried Delia for a cook but couldn't stand her because of her temper. You know mother never loses hers—so there's no temper envelope to come back."

"Exactly," agreed Uncle Jim with a smile. "You've got the idea, Mary Ann. Moreover, you're already touched on the other side, which is the really important one: not the kind of envelopes we receive, but those we send out to other people. Suppose we tried to get ours there first? Eventually, we'd raise the level of the whole transaction."

"Yes, I see. But to take a concrete case, Uncle Jim, what sort of envelope, as you call it, could I have sent to Mrs. Barnes? I couldn't think 'She'll be sweet and generous.' I know her too well."

"You might, though, think something like this, mightn't you? 'Nobody could be intentionally disagreeable about a real charity like this. Of course she'll help if she possibly can. It's a privilege!'"

"Humph!" said Mary, doubtfully.

Uncle Jim laughed. "What do you really think as you go round to get contributions?" he asked.

"Really and truly," said Mary, "I guess I think, 'I hate to ask you, and I'm sure you'll hate to help, but I think it's your duty, and I'll be furious if you don't; and I think myself quite superior to you!' Well, no wonder I get the results I do. My envelope says, 'Return a disagrceable answer in two minutes to Mary Mason!' You've given me a great deal to think over, Uncle Jim."

"At least,' 'said Uncle Jim, "that's what the flattering little envelope that you send me always calls for."—Youth's Companion.

HOUSEHOLD QUERIES

How Are Sweaters Worn?

The fashion magazines show very pretty sweaters which seem to be worn instead of waists. We are planning to go to a beach resort for a month and I think that a sweater would simplify the clothes question if I can wear it instead of a waist most of the time. But of course I want to do what "they" are doing.—Reader, Arizona.

"They" are most certainly wearing sweaters instead of waists, especially at the bcach. The hand knit ones can be made very attractive, even beautiful. As you have no doubt noticed in the fashion magazines they are inclined to run to a sort of glorified, frilly Russian blouse with loose sleeves. They are also made sleeveless and collarless in jumper effect; also crocheted of cotton thread in open filet pattern in dainty pinks, blues and yellows.

A SUBSTITUTE FOR A THERMOS BOTTLE

This is the season of the year when numerous picnic parties make a thermos bottle almost a necessity. Unfortunately for many these conveniences are too expensive for the occasional use required, and to these the following will be found a very satisfactory substitute—and the cost nothing at all:

Take two quart fruit jars and fill with cracked ice; wrap each jar with several thicknesses of newspaper and then wrap the two with several thicknesses of papers. It will be found that ice or ice water or iced tea will keep cool as long as in a thermos bottle that costs several dollars.—M. E. Bemis.

RUNNING FOR OFFICE

Away down in Georgia a candidate for county commissioner filed his statement of campaign expenditures, as by law required, which contained among other things the following items: Lost 1349 hours sleep thinking about the election. Lost two front teeth and a whole lot of hair in a personal encounter with an opponent. Donated one beef, four shoats and five sheep to a county barbecue. Gave away two pairs of suspenders, four calico dresses, $5 cash and thirteen baby rattles. Kissed 126 babies. Kindled fourteen kitchen fires. Put up four stoves. Walked 4,076 miles. Shook hands with 9,508 persons. Told 10,101 lies and talked enough to make in print 1,000 volumes. Attended sixteen revival meeting and was baptized four different times by immersion and twice some other way. Contributed $50 to foreign missions, and made love to nine grass widows. Hugged forty-nine old maids. Got dog bit thirty-nine times and was defeated.—Exchange.

WHY HE DOESN'T HEAR IT

"This is the fourth morning you've been late, Rufus." said the man to his colored chauffeur.

"Yes, sah," replied Rufus. "I did ovahsleep myself, sah."

"Where's that clock I gave you?"

"In m' room, sah."

"Don't you wind it up?"

"Oh, yes, sah. I winds it up, sah."

"And do you set the alarm?"

"Ev'ry night, sah, I set de alarm, sah."

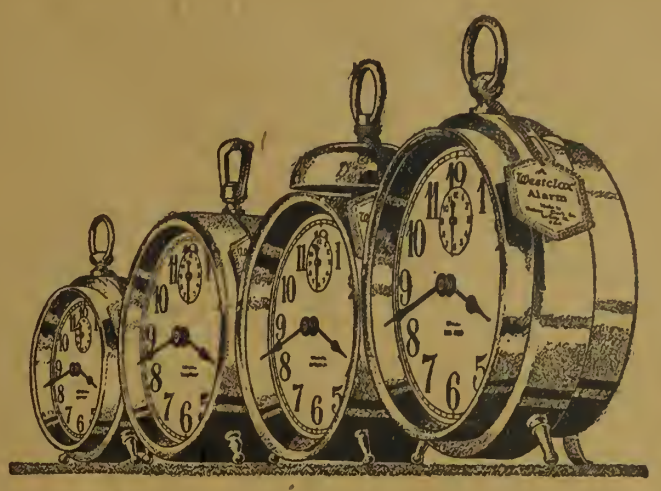
"But don't you hear the alarm in the morning, Rufus?"

"No, sah. Dere's de trouble, sah. Yer see, de blame thing goes of while I'm asleep, sah."—Yonkers Statesman.

THERE'S A DIFFERENCE

"They also serve," blind Milton wrote,
"Who only stand and wait."
This may be so, though why it is
I cannot clearly state.
But there's a proverb quite as true
That in our minds should stick;
They also serve (the devil well)
Who only stand and kick.
—San Diego Union.

A little borax added to the starch gives a gloss to the cothes and prevents sticking when ironing.



Westclox

WESTCLOX is a short way of saying Western clocks. It means a line of good alarm clocks made by the Western Clock Company. Every clock in the Westclox family is manufactured by the patented process that made Big Ben famous. Whether you select Big Ben, Sleep-Meter, America, or Baby Ben you *know* you're getting a good clock because each one is a Westclox.

To make it easy for you to recognize our clocks, we print the family-name, *Westclox*, on the dial right above the name of the clock. We also attach an orange colored, six-sided Westclox tag. These are marks of good time-keeping. Look for them on the alarm you buy.

Stock Raising in Western Canada
is as profitable as Grain Growing
In Western Canada Grain Growing is a profit maker. Raising Cattle, Sheep and Hogs brings certain success. It's easy to prosper where you can raise 20 to 45 bu. of wheat to the acre and buy on easy terms,
Land at $15 to $30 Per Acre
—Good Grazing Land at Much Less.
Railway and Land Co's. are offering unusual inducements to home-seekers to settle in Western Canada and enjoy her prosperity. Loans made for the purchase of stock or other farming requirements can be had at low interest.
The Governments of the Dominion and Provinces of Manitoba, Saskatchewan and Alberta extend every encouragement to the farmer and ranchman.
You can obtain excellent land at low prices on easy terms, and get high prices for your grain, cattle, sheep and hogs—low taxes (none on improvements), good markets and shipping facilities, free schools, churches, splendid climate and sure crops.
For illustrated literature, maps, description of lands for sale in Manitoba, Saskatchewan and Alberta, reduced railroad rates, etc., apply to Superintendent of Immigration, Ottawa, Canada, or

Sulphur

It has been proven and so recommended by the University of California that if you sulphur your grape vines and orchards SIX times they will not be affected by MILDEW or RED SPIDERS.

ANCHOR Brand Velvet Flowers of sulphur, also EAGLE Brand, Fleur de Soufre, packed in double sacks, are the fluffiest and PUREST sulphurs that money can buy; the best for vineyards; the best for bleaching purposes, LEAVING NO ASH.

VENTILATED Sublimed Sulphur—Impalpable Powder, 100 per cent pure, in double sacks, for Dry Dusting and making Paste—(Atomic Sulphur).

For LIME-SULPHUR SOLUTION, use our DIAMOND "S" BRAND REFINED FLOUR SULPHUR. We can furnish you this sulphur at such a low price that it would pay you to mix your own solution and net you a profit equal to the amount paid out for labor in spraying your orchard, even if you pay your men $4 per day for making the solution and applying same.

To create additional available plant food, drill into the soil 100 to 400 pounds per acre DIAMOND "S" BRAND POWDERED SULPHUR, 100 per cent pure. This has increased various crops up to 600 per cent.

Also PREPARED DRY DUSTING MATERIALS, Tobacco Dust, Dry Bordeaux, Dusting Sulphur Mixtures, etc.

And "Anchor" Brand Standard LIME-SULPHUR SOLUTION 33 DEGREES BE., Sulphur Paste, Nicotine, Blackleaf 40, etc. Fungicides and Insecticides.

Carried in stock and mixed to order.

San Francisco Sulphur Co.

624 California St. San Francisco, Calif.

We are equipped to make immediate shipments. Send for "ILLUSTRATED BOOKLET," also booklet "NEW USES FOR SULPHUR", Price-list, and Samples.

Please state for what purpose you use the sulphur, quantity needed, and date of shipment preferred. Telephone Kearny 871.

ARCADIAN

Sulphate of Ammonia

Men who applied ARCADIAN Sulphate of Ammonia to their grain are beginning to reap the profits.

ARCADIAN Sulphate of Ammonia is the well-known standard article that has done you good service in your mixed fertilizers for years past. Especially kiln-dried and ground to make it fine and dry. Ammonia 25¼ per cent. Made in U. S. A. Arcadian is the great American Ammoniate.

For sale by all the principal dealers.

Corn: California yellow, 3.15@3.40 per cental. Egyptian, 2.75@3.25; Milo maize, 2.50@3.00.

Rye: 3.65@3.75.

Wheat: Following are net weight prices for bulk grain, based on federal standards and grades at San Francisco Bay and Los Angeles terminals:

Hard Wheat—	Per Bushel	Per Cental
No. 1	2.20	3.66 1-3
No. 2	2.17	3.61 2-3
No. 3	2.13	3.55
Soft White—		
No. 1	2.18	3.63 1-3
No. 2	2.15	3.58 1-3
No. 3	2.11	3.51 2-3
Club and Sonora—		
No. 1	2.16	3.60
No. 2	2.13	3.55
No. 3	2.00	3.48 1-3

For sacked grain add nine cents per bushel of 60 pounds to above price. Deduction of three-fourths of a pound is made for weight of standard grain bags. Wheat grading under No. 3 and mixed or smutty wheat will be purchased according to merit.

Mill Feed (per ton): Bran 43.00@44.00; mill run, 42.00@43.00; Rolled barley, 52.00@54.00. Linseed oil cake meal, nominal; cocoanut cake or meal, 41.00@42.00 per ton.

HAY

Under date of July 12, Scott, Magner & Miller says:

Receipts past week 2141 tons; for the time between June 28 and July 3, 1123 tons. Since the Fourth of July, as is usually the case, receipts have commenced to increase very rapidly. To offset this increase in receipts business usually increases on account of large feeders laying in their winter supply at this time. Although the new crop is on a basis considerably lower than old crop hay, yet it is bringing fair prices. No. 1 Red Oat and also Wheat Hay is now arriving and orders are being filled without delay. Last year at this time the government was using in the neighborhood of 9000 tons of hay per month for their various encampments. At this time, however, it is only using about 1500 tons per month. As the government purchases were the principal business last year it would naturally be figured that trade should be quite dull. The interior trade, however, has been very fair.

Alfalfa seems to be the best seller, much being moved to interior points. Prices remain about the same as heretofore with our lower range of prices being the more popular and a downward tendency and feeling. Straw is nominal.

We quote today wholesale prices in carload lots for old hay as appear from dealers' transfers upon the hay market—for prices to consumers charges of cartage, commission and handling expenses must be added according to conditions:

Fancy Wheat hay (light 5 wire bales)	17.50@18.00
No. 1 Wheat or Wheat and Oat hay	15.00@17.00
No. 2 Wheat or Wheat and Oat hay	12.00@14.00
Choice Tame Oat hay	15.00@17.00
Other Tame Oat hay	12.00@14.00
Wild Oat hay	10.00@12.00
Barley hay	11.00@13.00
Alfalfa hay	14.00@16.00
Stock hay	9.00@11.00
No. 1 Barley straw, bale	.50@ .80

Citrus Markets

Los Angeles, July 16, 1919.

Weather conditions have been unfavorable to the disposal of oranges, likewise market has been filled with local grown fruits and cantaloupes.

Lemons are likewise in less demand and the price is somewhat off.

Shipments

Shipments of citrus fruits to date since November 1, 1918: Southern California; oranges 26,993 cars, lemons 7642, total 34,635. To same date last season; oranges 11,842, lemons 4819, total 1603. Central California this season; oranges 4422, lemons 354, total 4776. Last season to same date; oranges 2539, lemons 115, total 2654. Northern California; oranges 244, lemons 2; last year same date, oranges 203.

MARKET NOTES

The Bellflower crop of the Watsonville district will be very much heavier than last year. The entire apple output will probably total 2,750,000 boxes.

The dried apple output of the Watsonville district will amount to about 4000 tons; of the Sebastopol district, about 3500 tons.

California's apple crop last year exceeded that of Oregon by more than 1,000,000 boxes; it is estimated that Oregon will lead this year by some 300,000 boxes.

The Tractor to Buy

ARE you one of the many farmers who need more power to handle the farm work properly? Do you have to work with less help than you need?

If so, you need an International kerosene tractor. The size that gives you power for your heaviest load will handle all the work. Internationals use only as much fuel as the load requires. They are made to work with farm machines—the kind you are now using—and special hitches are provided for all kinds of field and road work. Their belt pulleys are large enough to prevent slippage, run at correct speed, and are set high enough to keep the belt off the ground. They all use kerosene or other low-grade fuels which means a big saving in operating expense.

The Company to Buy From

You know that we have supplied farmers with high-grade machines for nearly 88 years. You know that our tractors have furnished satisfactory farm power for more than 12 years. We have far too much at stake to market machines of any but the highest standards of quality. We expect to come back some day and sell you some other machines in the long list you see in this advertisement. In every sale we try to build for the future.

Tractor Service Whenever Needed

In line with this policy, we have developed a service organization which now consists of 89 branch houses and many thousands of loyal local dealers, wide awake and attentive to the needs of their customers. Service is a very essential part of any tractor sale. When you buy an International kerosene tractor you buy with it the assistance of an organization that brings a well stocked branch house or a live, local dealer within telephone call, fully equipped to keep your tractor working steadily.

International Tractor Sizes

International tractors, all using kerosene for fuel, are made in 8-16, 10-20, and 15-30 H. P. sizes. A line to the address below will bring you full information about all our tractors and about any other machines you mention in the list shown in this advertisement.

Showing the World What 600,000 Already Knew

OVERLAND Model 90 is a car of practical utility. It rides with luxurious comfort, and is amply powered for steep hills and rough roads. It gives service that you can depend upon under all conditions.

At the same time, Model 90 has the appearance which is a source of satisfaction to its owner.

The dependability of Model 90 is illustrated forcibly by four recent records, made in widely separated parts of the country and under greatly varying conditions.

In Oklahoma, a Model 90 stock car, motor sealed in *high gear*—broke the world's record, making 4370 miles in 7 days and 7 nights of continuous running.

Again on an informal test trip between Oakland and Los Angeles, a Model 90 covered 947 miles in 28 hours and 45 minutes, averaging 24.28 miles per gallon of gasoline in spite of fighting a heavy storm all the way.

In the "Boston-Springfield Dependability Run," a model 90 stock car made 3852 miles in 7 days and 7 nights at an average speed of 25 miles per hour without motor stop.

Then came the new World's record at Harrisburg—702.5 miles a day for 5¼ days without motor stop, sealed *high gear*. Here again a Model 90 stock car demonstrated its staying power.

Such convincing tests are only conspicuous examples of what thousands of Overland owners know their own cars are capable of doing.

Their experience is a safe guide for you in selecting a car.

Why is the June Drop?

By Many Subscribers

THERE is a proverb applying to the type of questions which may be asked of the wise man and which the wise man may not always answer. The pioneer in any industry always has a liberal number of these questions to ask, and the wisdom of our experts and scientific men of our experiment stations and universities, even of the practical hard-headed farmer, is not sufficient to answer. Fruit growers, especially, are raising questions these days. Our theories on pruning have been upset, our methods all along the line, especially as to fumigation and pest control, have materially changed and the wise men of the West are answering only provisionally.

Especially is this true in the matter of June drop. Hence the letter, copy of which is shown above, has gone to several of the citrus subscribers of the Cultivator, and some are already coming back with answer, or, at least, reply. Some of them, Yankee-like, have other questions which they are asking. It's a good time for an experience meeting, and we hope this page this week will lead to other pages in other weeks, with many suggestions which may lead to definite conclusions. Meantime the department of agriculture, the state university, and the state commission of horticulture are uniting in investigations along the same lines. We would not anticipate any of their findings, and the questions asked in above letter are with the purpose of stimulating thought and inducing our fruit growers to be ready for such suggestions as our scientific people may give us.

> Questions are coming to this office as to "June drop". Of course it is the same ever recuring question, but as old as it is we are unable to give the answer desired as to how to prevent. Possibly no one has any absolute and final information, but we may at least every year gather some information if we can get together some observations from practical growers.
>

>
> Did you plow or irrigate at blossoming time? Does such treatment cause or prevent setting or dropping?
>
> Please give us from your observations any other points which may be of interest to citrus growers along lines indicated by the questions above.

One of the first answers to come back was from a Butte County grower,

E. W. Fogg, Oroville, Butte County

Question: Has the navel drop been more serious this year than in former years?

Answer: Yes.

Q.: Why?

A.: That is exactly what we want to know.

Q.: How did you endeavor to control?

A.: By planting cover crop of Black-eye beans. Did not get them in early enough is our belief. Formerly have relied on irrigation and early pruning. Have used ground sheep manure and cow manure ground. Should act quickly we are told.

Q.: Did you plow or irrigate at blossoming time?

A.: Plowed before and irrigated before.

Q.: Does such treatment cause or prevent setting or dropping?

A.: Perhaps age of trees may be responsible, still we know of like age orchards having good crops in same section, but with cover crop. We are told that alfalfa for a cover crop is the thing. We intend to try it.

* * *

The next answer comes from a citrus growing section nearly 600 miles farther south. Is is from

Geo. W. Waterbury, Corona, Riverside County

One assertion about the navel orange we all agree upon: it doesn't overbear. The lemon tree will sometimes produce too much fruit one year and lay off the next; the bloods that yield heavily one season will probably have a lighter yield the next, and many varieties of deciduous fruits will overproduce unless thinned. But our navel trees take care of their own thinning, and rather too thoroughly in the orchardist's opinion.

Conditions in the interior sections of the citrus belt have been most unfavorable during the past six months for a large set of oranges and lemons. The weather during the winter months was very dry and cold. The rainfall in some sections was the lowest in many years. The spring was cool, rainless and with considerable fog, followed in June by a sudden rise in temperature and very low humidity. It is no wonder that weak navel trees have again dropped most of their young fruit, the best holding on to but a modest portion.

Climatic condition at the time the young fruit is setting is perhaps a controlling factor in the drop. Heat does not play as important a part as moisture in the air; it is lack of humidity that does the damage. I spent one winter in the South Sea islands, where the temperature ranged higher every day than in Riverside County, yet so full of moisture was the air that all vegetation grew with the utmost perfection.

Conditions during the spring months are even more intensified in Tulare County than in Riverside and San Bernardino Counties, and it is a well known fact that the navel tree is a shy bearer in that section on those years when early spring months are hot and dry.

The set of fruit on the navel tree is largely governed, in a comparative way, by the vigor and vitality of the tree itself. I have never seen anything done during a single year that seemed to influence the fruit crop very much during that period. It is rather a matter of good judgment and big financial expenditures over a period of years. If an orchard has deteriorated for three years it seems to be about an equal time in recovering. The mulching system and basin system, in practical orchard work, has not proven a success, and summer cover crops, for most of us, are out of the question, owing to the lack of unlimited irrigating water.

Most orchardists work the soil fairly well, but few prune properly or fertilize well. The killing of the scale is by many prolonged too much, thus devitalizing the trees and making them unable to hold much young fruit during the ensuing spring. Our problem seems to be in doing well the things we know, or should know how to do, rather than in uncertain experimentation. This is the province of the experimental station men and they know that the gathering of a few truths from the realm of the unknown is the work not of months, but of a lifetime.

The most successful orchardists seem to be those who have not been the first to fly to a new and untried system nor the last to adopt for practical purposes one that has been demonstrated to be beneficial beyond all doubt.

* * *

Los Angeles County likewise has had its drop. From that county we have a short communication by the manager of what was once termed the largest navel orange grove in the world. He has been in entire charge of this property for nearly a quarter of a century and his observations are of value. It may be noted, however, that he does not assign to any one cause this drop of oranges, and the sensible suggestion he gives is to have our oranges in the best of producing conditions at all times. Here is his own statement:

Frank L. Palmer, North Pomona, Los Angeles County

As to the "June drop" of the orange, I think we all agree that it is a purely natural process, and it is only when the drop is excessive that we attach any importance to it.

Under normal conditions of temperature, I think the setting and holding of the fruit may be very materially influenced by general good care of the orchard, particularly by observing proper cultural conditions and by keeping the trees well supplied with moisture during the spring months. To this should be added early spraying with lime-sulphur spray if the trees are infested with red spider or thrips.

I have never discovered any fertilizing formula that will make the little orangcs "stick" if proper irrigation and good culture have been neglected.

These remarks refer, as stated above, to seasons of normal conditions of temperature. In June of 1917 we experienced a hot wave that gave for several days a temperature much above normal, and which resulted in loss of a large percentage of the navel crop.

This excessive "June drop" of 1917 has been a subject of special study by some of the experts of the experiment station, and their findings have been widely published.

I feel sure that laymen will do well to study their findings and to follow their suggestions and advice.

My own observations lead me to believe that the trees which had the greatest abundance of soil moisture to draw upon during that critical period of heat were the trees that matured the largest crops of fruit that season.

I advocate and practice early spring irrigation, particularly if the spring rains are light.

And I am also convinced that summer cover crops will exercise a marked influence for good. Unquestionably such crops call for an unusually abundant irrigation supply and are not generally feasible on that account. Orchardists who own a sufficient supply of water to successfully grow a summer cover crop must be voted among the fortunate and favored ones.

* * *

Ventura grows but few navel oranges. However, we have from

C. C. Teague, Santa Paula, Ventura County:

We do not grow any oranges at all. We are exclusively engaged in the production of lemons so far as citrus production is concerned.

Our experience this year in regard to lemons is not much different from that of former years. We have all the lemons on the trees at this time of year that we care for, as we rather prefer not to have a spring set that is too heavy, but would rather have the crop set along throughout the summer and fall months, which gives us more summer lemons.

* * *

Englehart's lemon pruning system has been referred to and studied for years. Mr. Englehart is one of California's for-sure pioneers, and he has not only studied lemon pruning but all the problems concerned with citrus culture. His ideas on lemon drop, three of which he gives, will be of wide interest:

J. P. Englehart, Glendora, Los Angeles County

Both navel and lemon June drop have been unusually serious this year. Observation on my trees leads me to think that the fruit bearing branches were not hardened enough to withstand the sudden great change in temperature. Owing to the scarcity of potash, we dispensed with our usual custom of applying occasional doses of potash during the year. Probably our soil contains as much potash as the trees need, but it certainly is not

OUR ADVERTISERS RELIABLE
We guarantee our subscribers against loss through dishonesty of any advertisers in the Cultivator. We do not attempt, however, to adjust trifling differences between subscribers and honest, responsible advertisers, nor will we pay the debts of honest bankrupts. Notice of complaint must be sent us within 30 days from date of the transaction, and the subscriber must have mentioned the Cultivator when writing the advertiser.

THIS WEEK'S COVER

June drop is being more earnestly discussed than for some months. It may be recalled that two years ago the June drop was more serious than ever before in the history of the industry. Last year, again, we had a good crop. Now comes another serious drop though nothing in comparison with two years ago. There have been many inquiries as to the cause of this drop and many theories advanced to account for it. There are some growers, however, who have no theories to offer, but contribute to the discussion only a big question mark. We have asked a number of experienced growers for their opinions and they are given on the third and later pages of this issue. The cover cut, however, is a normal Washington Navel tree which should bear large and regular crops if the conditions can be made right on those June days when the heat rises above normal.

JUNE DROP

The practical suggestions given in the various articles which begin on Page 3 of this issue will result, we believe, in material increase in another year's crop of Washington Navels.

Large investment is roquired to bring an orange grove to bearing. When this has boen made and the little fruit is setting, and all from the size of peas to the size of hickory nuts begin to rattle from the branches like hail, it brings a sickening feeling to the heart of the orango grove owner. He stands helpless and asks: "Why?"

None of our subscribers pretends to answer this pertinent question though everyone of them has suggestions which are of value. In the main they center around this one thought that every step which makes for healthiest and best conditions of soil and tree gives advantage to the tree when its testing time comes. It is not in superabundance of water; neither is it in application of fertilizers; neither is it in the best and most thorough tilth of the soil; nor yet in pruning, scale eradication nor any other one step; but a combination of all certainly gives some insurance.

EXPENSIVE SMOKES

The forest service reports the fining of two men $50 each because they carelessly threw away cigarette stubs which caused serious field fires. Smoking is necessary to the happiness of some people, but in the dried tinder sections of field and forest at this period of the year there is opportunity for a little self control which will add to the wealth of the state.

PRESIDENT WHEELER RETIRES

President Benjamin Ide Wheeler of the University of California, formally closed his desk on the evening of July 15 and became president emeritus and professor of comparative philology. President Wheeler has served a score of years at the head of California's great educational institution and has seen wonderful advancement in its work and in the attendance.

W. S. S.

The Uniter States treasury has announced that the war savings stamp campaign will be continued indefinitely. This means that the wonderful savings bank opportunity where four per cent may be secured, with money available at all times, is to be extended to the people. In addition there are now to be issued big brothers to the war savings stamps in war savings certificates. These will be issued in $100 and $1000 denominations and may be purchased at first and second class post offices. That is, as to the $100 certificates; the $1000 certificates may be secured only through banks and trust companies. These are all registered securities.

ADVANCING EDUCATION

It is gratifying to know that the state university summer session—rather sessions, for there are now two held, one in Berkeley and one in Los Angeles—are attracting greater numbers of attendants than any preceding year. In the two schools there aro 4075 attendants. The greater number of these are at Berkeley, Los Angeles having this year 885, an increase of 40 per cent over last year, which was the first session held in the south. The Los Angeles branch of the state university now promises to become a great educational institution. It will occupy the site of the former statc normal school which has become a part of tho state university.

One of the most gratifying fcatures of these schools is tho great dèmand for opportunities for agricultural cducation. Dean Hunt of the agricultural college is delivering a series of lectures on agriculture in Europo at the southern sessions this week.

CONTROL PACKING INDUSTRY

The people of the country are becoming concerned as to the grip on the American food supply secured by the so-called packing house trust. This has caused the presenting of a bill in congress known as the Kenyon bill, Senate 2202, which provided that concerns engaged in slaughtering live stock, preparing live stock products for sale, marketing live stock produce, conducting and operating stockyards, collecting or distributing live stock quotations, buying, selling or shipping dairy products, in excess of $500,000 a year, shall secure license from the secretary of the treasury.

The federal trade commission has made extended investigations of the American food situation and is now giving warning to the people that it is of greatest importance that it be brought under national control.

AN INHERITANCE

Among others to whom the Cultivator wrote asking questions as to causes of June drop was that veteran orange grower of Riverside, James H. Reed. Mr. Reed replied that at 86 he was not entering very largely into cultural operations so turned the question over to his son. We are sorry to release from the task of inspiring others to better cultural methods one of Mr. Reed's abilities, but he has earned a rich reward in the rest he is taking these days, and we take this occasion to remind him that he should enjoy them to the fullest with the consciousness that "The father's virtues are the son's inheritance." Therein Mr. Reed has great estate. We hope we may yet hear from him in response to the many questions that still come up before California's fruit growers.

EDWARD W. MASLIN

When the fig industry was young the inquiry was frequent: "Why can I not produce figs on my imported Smyrnas?" and soon the answer suggested itself that it was because of variety, so Asia Minor was searched for the proper variety and a great number of cuttings brought to California. Amongst the largest planters of these cutting was E. W. Maslin who had at that time an orchard near Loomis in Placer County. He stuck some of those cuttings among the great boulders which are so common in that section, and the rich soil gave a wonderful growth of tree. But the trees refused to bear, or rather before the fruit had attained a third or fourth of its mature size it dropped off.

The search for the reason is a long, long story and, as all our readers know, resulted in the finding of the blastophaga, or insect which fertilized the blossoms of the true Smyrna fig and made the industry one of California's most promising.

Mr. Maslin was not only a pioneer; he was a persistent pioneer, for when his trees refused to bring their fruit to maturity he kept them growing. Today that orchard which Mr. Maslin planted is one of the foundation stones of the industry. There are many varieties of the original Smyrna figs in the orchard and the more desirable of these are being used in reproducing other orchards.

Mr. Maslin has now passed; he died at his home in San Francisco a few weeks ago. The orchard which ho plantcd remains, and the industry will long remain as a monument to his work for California.

AUTO GRAPHS

Wonderfully rich lands at Stockton. It's where the dryer stretches of the plains meet the richer, moisture filled lands of the San Joaquin. The grain is tall and the heads wonderfully plump and well filled.

* * *

Almost the first sight of Stockton's manufacturing district was that of the smokestacks of the big tractor factories. Some of America's first tractors were manufactured in Stockton. We recall many years ago a trip through one of the factories there when the big horse drawn combined harvesters were the principal product. Today there are still many combined machines being produced, but the chief energies of two great factories in that city are given over to tractor manufacture. They have proven wonderful aids in times of peace; equally so in times of war.

* * *

The fair grounds at Sacramento are already taking on new life in preparation for the coming state fair. The great central, or horticultural, building which last year was less than half completed is now ready for exhibits from one end to the other. The great central dome makes it an imposing structure.

* * *

Crossing over the Sacramento river from the business district of the city of Sacramento one takes but a few minutes drive until he is on the great causeway connecting Sacramento with the rich farming sections of Yolo County. It's a wonderful piece of road making and, paralelling the Southern Pacific as it does, makes good advertising of California's road system.

* * *

Just beyond the western end of the causeway is the University Farm. We used to think the dilapidated surroundings of this farm indicated that a serious mistake had been made in locating it. It looks different today, and the town of Davis is showing some public spirit and really becoming proud of "our farm."

* * *

The University Farm is worth being proud of. It is not only affording the means for teaching the young agricultural idea how to shoot, but some of the older ideas how to correct their aim. The University Farm is a practical example of California agriculture on the job. There are now something like 1000 acres in this great property. There are vineyards; there are orchards; there are green fields; alfalfa patches; poultry demonstration yards and buildings; silos; dairy barns; piggeries; demonstrations of irrigation appliances; in fact, pretty nearly everything concerned in the diverse agriculture of California. That there is diversity in this state is plain to every agriculturist. In the orchards are plots which have been given over to pruning of trees according to almost every theory of pruning, and these demonstrations are proving some things, for the trees are now nearly a dozen years old, and there are enough of them to show general character as a result of continued methods of work.

* * *

We had the pleasure of a look-in on a bunch of steers. Alex McDonald is doing the feeding. Prof. True is busy and away these days. He has been over at the Islands judging live stock at the territorial fair. When he came home they promptly put him to work pulling off a great San Francisco live stock show. In his absence J. I. Thompson becomes acting professor of animal husbandry and head of the department, and True has nothing on Thompson when it comes to enthusiasm. We have no predictions to make as to that pen of steers, but we are hoping some of them will take a Pullman trip to the International at Chicago this coming December and continue the string of honors which has come to California from that great show.

* * *

Unloading hay is not particularly thrilling. However, it was with a good deal of satisfaction that I noted the way in which a great big load of grain hay was put in the loft of the horse barn in some three or four forkfuls. The University Farm barns are not put up along tho nickel plated line, but they are practical, and the ease with which the big Percheron handled the hay fork and the big load of hay was sufficient to give quite a thrill.

Growing of Alfalfa Important in Arizona

By M. E. Bemis

ALFALFA continues to be the one most important crop to farmers in Arizona and particularly in the Salt River Valley. For the benefit of Cultivator readers I present here some figures showing the acreage value and the value as fed to animals on the farms. These figures were compiled and checked from various sources and are as near accurate, I believe, as it is possible for any estimate to be.

The total irrigated area of Maricopa County is 296,500 acres. Of this, 120,000 acres is in alfalfa, 85,000 acres is used for making hay, 3000 acres for seed production, and the balance is pastured. The total revenue from alfalfa is $7,110,000. Two-thirds of this is fed to livestock on the farms of the valley and brings an additional revenue of nearly $2,000,000.

Revenue From Live Stock
Maricopa County

35,100,000 pounds of milk for the retail trade	$1,404,000
46,800,000 pounds of milk for condensing and ice cream	1,146,000
74,100,000 pounds of milk for butter and cheese	1,556,000
28,000 head annual increase	1,680,000
	$5,786,000

	$4,087,500
Total annual revenue from live stock	$9,873,500

Alfalfa is as old as civilization itself. Lost in the maze of myths and legends the origin of this wonderful plant will ever remain a mystery but its value to the human race increases as the world grows older. No other plant can compare with it; it is the nearest balanced ration of any single plant known; in yields of animal nutrients at a low cost of production it is unequaled.

Scientists have found by analysis of soils and soil products, by careful experiments and painstaking observations that which some farmers learned long ago — namely, that the basis of good sound farming, that which produces the most valuable food for live stock and impoverishes the land least is the growing of legumes. The eastern farmer had his red clover, and the southern planter his cow peas, but each knew that the king of all legumes is alfalfa. All over the country from Canada to Mexico, from the Atlantic to the Pacific, progressive farmers are bending every effort to grow alfalfa, but in no section of the United States does alfalfa do as well as in the arid lands where there is water for irrigation. Here the land is naturally rich in lime, potash and phosphorus, and the alfalfa draws from the atmosphere its own nitrogen.

The Natural Home of Alfalfa

Here there is no tedious and expensive preparation of the land necessary, no fertilizing, no liming, no inoculating the seed. All that is necessary is to level the desert land, thoroughly prepare the ground, irrigate and sow the seed, harrowing it in lightly. While alfalfa seems to find its natural home anywhere in the arid Southwest, the soil, climate and elevation of the Salt River Valley of Arizona seems to be in all things ideal for the cultivation of alfalfa. Dr. Freeman, in his bulletin, "Alfalfa in the Southwest," says that he finds no mention of alfalfa in the early history of the valley, and he reasons that the development of the plant here has been almost entirely in the last 35 years.

The following letter from County Agricultural Agent H. C. Heard shows the average cost of preparing the land for alfalfa and the cost of making alfalfa hay:

Estimates of costs of seeding: Plowing, $6.00; disking, harrowing, leveling, $4.00; two irrigations, $2.00; 15 pounds seed at 16 cents (common) or 38 cents (Hairy Peruvian) $2.40, or $5.70; total $17.70.

"My estimate of the cost of raising and harvesting one crop is as follows: Two irrigations, $1.50; mowing and raking, $1.25; cocking, $1.50; hauling and stacking, $1.75; rent or interest, $4.00; total, $10.00.

"In interpreting, please bear in mind that they were figured on the basis of seven cuttings per year, which, if not pastured in winter, should yield about eight tons per acre. Of course much alfalfa in the valley does not yield this high, but productive possibilities are indicated by an authenticated yield of ten tons per acre per year for four consecutive years."

Yields

From the first year's seeding yields of six tons are on record, possibly this is better than the average, as the first year's crop is not commonly expected to be as much as after it has reached maturity. The second year yields of six to ten tons may be produced by careful management and in addition considerable winter pasturage.

Practice of Dairymen

With the large number of dairy cows in the county there is of course necessity for much pasture, and most dairymen are following a plan somewhat similar to the one mentioned in Dr. Clothier's report of farms of Southern Arizona. Some have practiced a soiling system, or cutting the alfalfa green and feeding it to the cattle in racks. This results in increasing the carrying capacity of the alfalfa fields about 100 per cent. In other words, the same farm will carry nearly double the stock where the alfalfa is cut green and hauled to them that it will where it is pastured. This, however, is where the fields are large and not where a system such as Dr. Clothier describes is followed. The extraordinary amount of labor required for cutting and hauling the alfalfa green has made this system one which is not practicable except when labor can be had at fairly low rates or where hay is very high.

The following letter from State Dairy Commissioner W. A. Barr shows the value of alfalfa when fed to dairy cows. It might be mentioned that the average price of butter fat for the past year has been above 60 cents a pound:

"In determining the cost of milk production at the present time and from that, the value of hay, the Warren and the Pierson formulas were used, applying the same to conditions locally. These formulas state that 32 pounds of grain, 70 pounds of hay and 110 pounds of silage are required to produce 100 pounds of milk. A ration consisting of bran, barley and cotton seed meal at current quotations, and on the basis of five to eight pounds of grain per day per cow, gives an average valuation of $55.00 per ton for grain. Silage by our conservative stockmen is given a rating of $10.00 per ton. An arbitrary value of $20.00 per ton was placed on hay. Under local conditions, about 1 1-3 hours of labor is required to produce 100 pounds of milk. Labor at 30 cents per hour, grain, hay and silage at the figures mentioned and the amounts required to produce 100 pounds of milk gives a total cost of $2.48.

"To produce 100 pounds of milk averaging 3.6 per cent butter fat, this is equivalent to a valuation of 68 cents per pound butter fat. When butter fat is worth 60 cents per pound hay is worth $17.70 per ton, determined on the basis above used. When butter fat is worth 75 cents per pound hay has a valuation of $22.00 per ton. Hay, when fed alone, has a lesser value per ton than when fed in conjunction with grains and succulent feeds. Experimental data show hay to be worth approximately 75 per cent when constituting the dairy cow ration, of what it is worth when fed in conjunction with other feeds. On the basis of a hay consumption of approximately 32 pounds per day per cow, with a production of 75 per cent, of a cow receiving hay and grain, hay is worth $16 per ton when butter fat is worth 60 cents per pound, and when butter fat is worth 75 cents per pound, is worth $20 per ton, against a value of $22 per ton when fed with grain and silage. The basis of production in this determination has been 5000 pounds of milk per cow per year, or 180 pounds of butter fat, which, from available data, indicates that these figures are approximately ac-

Agricultural News Notes of the Pacific Coast

Northern California

Modoc County hay growers are commanding $25 per ton.

Yuba City, Sutter County, is experiencing an epidemic of hog cholera.

A car of assorted fruits from Vacaville, Solano County, recently sold for $3310.

Sacramento proposes to inaugurate a $10,000,000 building campaign for that city.

Apricot growers at Haywards, Alameda County, have sold apricots at $150 per ton.

A Solano County grain grower reports 2160 sacks of grain from 105 acres of wheat

The state of California maintains free camping grounds on the shores of Lake Tahoe.

The state fair premium list provides for $2250 for premiums for Shorthorn cattle

Members of the California farm bureaus are to be asked to vote on the daylight saving law.

It is estimated that 2000 autos passed through Auburn July 3-5 on the way to Lake Tahoe.

Capitalists are investigating as to possibilities of the Hayfork irrigation district in Trinity County.

For the first time in the history of the state fair it offers no premiums for California produced wines.

Yuba County supervisors have appropriated $2000 for continuance of farm adviser expense in that county.

The forest service is making survey for a road projected from Echo Lake to Glen Alpine Springs, Eldorado County.

Gordon H. True is busy arranging for the great live stock show now definitely scheduled November 1-8 at San Francisco.

Valuations of real estate in Alameda County, according to figures in the county assessor's office, have jumped $12,239,000.

A hundred acre range fire which caused serious losses in Alameda County has been traced to the carelessness of a hunter.

Modoc County voted strong for state highway bonds and in addition gave overwhelming vote for the $400,000 county good roads bonds.

The executive committee of the Placer County farm bureau fair has nearly completed arrangements for the county fair to be held late in August.

Sacramento County rabbit enthusiasts have organized a Northern California Rabbit Breeders' Association. Mrs M. Gammon of Sacramento is secretary.

The fish car of the state fish and game commission recently delivered 100 cases of young rainbow trout to streams near Sonora, Tuolumne County.

Rice growers along the Sacramento have crops in excellent condition; planting was early this year and the growth is three or four weeks in advance of last year.

By enactment of the recent legislature the state railroad commission now exercises a new function in regulating the rates of service for storage of foodstuffs in warehouses.

Central California

Tulare County calls for greatest conservation in use of water.

Tulare County grapefruit crop has been practically all shipped.

Merced County will plant a 4,000 acre peach orchard next season.

Hanford, Kings County, reports almost total failure of honey crop.

The Merritt wage scale calls for eight hour day, 45 cents per hour.

All fruit dealers and grain brokers are now paying special tax of $50 per year.

Parlier, Fresno County, is planning a model community camp for fruit workers.

Toppers at recent hog sale of the Tulare County farm bureau netted to the growers $18.70.

Tulare public auction of fat hogs resulted in sales aggregating $11,160. toppers went for $18.70.

Tulare recently held public sale of mules. 71 sold for $10,600. The topper span went for $565.

The headquarters of the state dairy bureau has been removed from San Francisco to Sacramento.

Several Gilroy, San Benito County, apricot growers dried apricots whole because of labor shortage.

Fishermen along the San Joaquin River have been lucky in landing large numbers of fine salmon.

Tulare County farmers are recommending the use of war flame throwers in the control of grasshoppers.

Salinas, Monterey County, is moving for an agricultural fair and educational exposition to be held in October.

The board of supervisors of Fresno County will soon appoint fruit inspector to have charge of inspection work in fruit packing houses.

The San Joaquin Valley Milk Producers' Association is engaged in a big drive to secure 2,000 members owning over 100,000 cows.

One evaporator recently installed near San Jose dried grapes in best of condition in 12 hours, apricots in six hours, plums in nine hours.

Stockholders of the Visalia creamery have voted to accept the offer of the Valley Milk Producers' Association to purchase their plant.

A large warehouse filled with wheat, together with four cars loaded with wheat on the siding at Los Banos. were destroyed by fire last week.

Commissioner Rutherford of Stanislaus County is organizing systematic war on weeds. Ten inspectors of the county office are directing the campaign.

F. W. Krogh, at the head of large pump manufacturing company of San Francisco, died recently. He was interested in farming properties in Tulare County.

The Farmers' Union at Mountain View, Santa Clara County, is appealing for widening the apron or shoulder of the pavement on the highways of that section.

Tho Vegetable Growers of California Inc. have now paid Santa Clara County growers 75 per cent of tho amount due on last season's tomatoes. Some canners have sued because of non-fulfillment of contracts.

Southern California

Cotton growers are anticipating $60 per ton for seed.

Several canneries have been running day and night on apricots.

San Jacinto, Riverside County, is appealing for the erection of a cannery.

Outlying sections in Orange County are asking for extension of rural free delivery.

Canneries and dry yards are gradually reaching the end of their season on apricots.

Palo Verde Valley is growing dates and will make exhibit at the coming Riverside fair.

Uplands, San Bernardino County, proposes to make clean-up of mealy bug from citrus orchards.

Puente, Los Angeles County, reports its walnut trees as loaded almost to the breaking point.

Prof. Fawcett is giving demonstration before citrus growers in methods of fighting citrus gum disease.

July 14 was annual picnic day in Fairmount Park, Riverside, for the Arlington Poultry Association.

Palo Verde Valley growers are topping their cotton, claiming they get sturdier plants and more bolls.

Santa Paula, Ventura County, says its "Big Four" is made up of the lemon, walnut, apricot, and Lima bean.

Hemet, Riverside County, dairies have been improved by the importation of pure bred Holsteins from Wisconsin.

Practically every fumigator will this year use liquid gas instead of the former cyanide-acid method of generation.

Buyers are offering to contract Palo Verde cotton at 32 cents, the highest price yet offered under contract to Palo Verde growers.

The corn ear worm is making its regular attack on Lima beans in Ventura County. It is feared the damage may be quite serious.

The First National bank of Hemet is offering $300 in prizes for the best apricots and peaches grown in the Hemet-San Jacinto district.

Imperial Valley cantaloupe season proved to be a longer one this year than any preceding year. The total shipments aggregated 7485 cars.

Commissioner Brock of Ventura County reports that fumigation on citrus trees during the fall will be more general than in any former year.

State Dairy Inspector Biles is canvassing San Diego and Imperial Counties urging tuberculin test and other sanitary measures required under state law.

Orange County's sealer of weights and measures has been following hay balers and insisting on correction of weighing abuses which have prevailed for years.

A Ventura County surgeon, called to a far away ranch at Santa Susanna to a boy with a broken arm, made the trip in an airplane. The 30 miles was made in 22 minutes.

Two-thirds of California's walnut crop is grown in Ventura, Los Angeles and Orange Counties. The production for tho present year will be 10,000,000 pounds greater than last year.

The Coast and General

Hood River, Oregon, shipped 98 cars of strawberries.

Hood River, Oregon, county fair will be held September 19, 20.

Vancouver, British Columbia, prices on eggs are now at 55 cents.

Great losses of fruit on New York docks have been caused by strikes.

Colorado potato shippers recently held their annual meeting at Manitou, Colorado.

Canning companies at Portland, Oregon, are offering ten cents per pound for canning cherries.

A conference of the cattle growers and United States forest officials was held at Prescott, Arizona, July 7.

The livestock association of Stevens County, Washington, will hold its annual show at Colville, October 1-3.

The city water main is being extended from Phoenix to the state fair grounds, in order to furnish adequate fire protection.

This is the height of the fishing season from Ketchikan to Nome. Canneries along the coast employ some 20,000 people.

The American Fruit Growers' Inc. has purchased some of the best fruit bearing orchards in the Wenatchee Valley of Washington.

The Kansas-Oklahoma fruit jobbers at a recent meeting made demand that express companies agents must quit handling goods on consignment.

Express companies have refused to handle watermelons from the Waterford district of Texas unless they are crated, and the growers and shippers are in arms because they are not prepared for this method of handling.

The Southwest Cotton Company owning two big plantations of several thousand acres each, 15 and 30 miles respectively from the central office at Phoenix, have purchased a Curtis airplane for the purpose of quicker transportation between the main office and the two plantations.

Seventy-five representative fruit and nut growers, from every important producing district of Oregon, met in Portland and formed the Oregon Growers' Cooperative Association. Its organizers said this is the largest organization of the kind ever attempted in the Northwest. It closely follows the California plan of cooperation.

Professor S. C. Mason of the United States bureau of plant industry, has been investigating the date industry in the Salt River Valley. As a result of his investigation, future plantings will be made at the Salt River Valley experiment farm near Mesa Professor Mason believes that the high altitude of the Mesa farm will be better for date culture than the old Tempe date farm.

The reports of the bureau of crop estimates of the United States department of agriculture show that the acreage of Egyptian cotton in Arizona this year will be about 95,000, of Sea Island cotton about 65,000. The acreage of Sea Island is much less than a year ago. The acreage of Long Staple in California is 2,000 as against 4,000 last year. It is thus apparent that about three-fourths of the American Long Staple cotton will be produced in Arizona this season.

Prune Prices Fixed Upon

THE prune growers have been getting restive and some even more than restive because the association did not name prices as they desired. Some have even violated their contracts and disposed of fruit on the outside. Presumably now they will wish they hadn't. The association now gives prices for the coming season's output in a circular from which we quote:

Prices to be paid California prune growers for their 1919 crop hy the California Prune and Apricot Growers, Inc. which will mean millions of dollars to the farmers of the state, were announced today by the growers cooperative organization which was formed two years ago on a basis controlling 75 per cent of the state's output of prunes.

The growers will be paid a bulk basis price of 13.56 cents per pound. Basis prices according to sizes run: 20-30's 22 cents flat, 30-40's 16 cents 40-50's 14 cents, 50-60's 12 cents, 60-70's 11½ cents, 70-80's 11 cents, 80-90's 11 cents and 90-100's 11 cents. One cent per pound premium will be paid for fruit delivered before Septemher 20. On small sized fruit 8½ cents a pound will be paid for 100-120's and 7½ cents for 120's and up.

These prices, which will bring the grower an average of a little more than 14 cents a pound for his fruit mean that the value of this year's production to the farmers inside the cooperative association will amount to more than $25,000,000. It will be a flood of prosperity such as the fruit growers have never experienced hefore.

In comparison to prices paid by independent packers, who in a bitter fight against the association have been trying for several months to buy crops from the growers before the naming of the association price, the association is paying an average price from four to five cents above the average offered hy the outside interests.

Careful estimates of the early buying done by the independents are that they have paid 9 cents or under for 75 per cent of their purchases and that a 9½ cent bulk basis would he a fair average for all sales made to them hy the outside grower as compared with the 13.56 cents a pound which the association will pay to its memhers. Most of the independent buying was done from 7 to 8½ cents a pound bulk hasis.

The occasional reports of 13½ and 14 cents a pound paid by the independents to the grower, which have been widely advertised among the farmers, include only occasional offerings on the part of the independents for choice lots of fruit, according to H. G. Coykendall, general manager of the association.

Under the price named today hy the association the growers will get an average of 14.22 cents a pound for their crop dried and delivered at the association packing houses located in their district. This amounts to $284.40 a ton. The independent packers have averaged about $190 a ton on purchases made from growers outside the association, who have lost in their gamhle that this price would be higher than the one to be named by the state association.

The high price named by the association and the consequent golden shower which will rain on the growers who turn their crops into the association apparently fully justifies the formation and continued existence of the state wide non profit cooperative organization formed two years ago hy the growers to get for themselves the full benefit of their investments in their orchards and a fair return on their lahor hy stahilizing market conditions and eliminating as far as possible the speculative juggling which resulted with the selling end of their husiness in the hands of private interests.

In announcing prices today it was stated that sales had been made of millions of pounds of prunes during the past few months to wholesale grocers and johbers who had agreed to pay any price named by the association. Scores of orders were turned down and no sales have been made for several weeks it was said hecause the association had sold all the stocks it dared until a more accurate estimate of the size of this year's crop could be made. When sales are again thrown open it will be at an advance over the prices named today according to officials of the association.

H. G. Coykendall, general manager of the association, in announcing price today gave out this statement to the growers:

"The association has justified its existence a hundred times over in the prices sent out today to its members. California prune growers could not have a more convincing proof placed hefore them of the value of cooperation."

Save the Water

MR. GEO. B. MORTIMER, connected with the Wisconsin college of agriculture, makes striking statements in Hoard's Dairyman as to duty of water. This is not so much with reference to irrigation as to natural soil water as it has to do with Eastern crop production, but it is so forceful that we give it entire:

Adopt a plant from its wild state into the family of useful plants and it soon loses many of its undesirahle qualities through proper breeding and selection. Like man, no plant can serve two masters efficiently. Just as its usefulness is enhanced by care and protection, so will its fighting habits disappear in proportion. In fact, the lack of usefulness comhined with fighting qualities is what makes a plant a weed, and the demand which economic plants make upon man for their protection is the price we must pay for their improvement. A weed is a Johnny-on-the-spot, and it takes a Johnny-on-the-spot farmer to comhat it.

It is estimated that our annual corn crop suffers a ten per cent loss due to weeds alone—a loss sustained under normal cultural practices. While the reasons may not be clearly understood why crop yields are reduced by weedy growths, they must center around food, light and moisture supplies, together with an interference of proper root development on the part of the crop heing grown. Undouhtedly, the latter is of greater importance than we are inclined to attach to it.

But whatever the underlying causes may be, it can be said with safety that no one single factor will cut down on corn yields so effectively as to allow weeds to choke the young plants in the hills or rows. The good corn grower never overlooks an opportunity to rid his corn field of weeds. It looks much easier ahout corn planting time to keep the field clean than it does later on when the plants are a foot or more high. But unfortunately this is not the case.

Did it ever occur to you that all the weeds which will appear in the corn field this season are there now either as seeds or biennial and perennial roots? In the case of fall-plowed land that is to he planted with corn much can be done to rid the soil of weeds before the corn is planted. Perhaps no one day's lahor will yield such big returns as the one spent in disking or harrowing up the fall-plowed corn land early in the spring. The opening up of the soil will warm it and allow the air to enter. This will set thousands of weed seeds to germinating, many of which will he brought up from the lower soil depths.

A subsequent harrowing on a sunshiny day will destroy those which have sprouted, accomplishing what cultivations are expected to do—but wherein they often fail. It gets the weeds in the "white stage," before they have done any material damage. Besides, it is much easier to destroy them at this time. But this is only half of the story.

Much of the crop will be made from the water in the depths of the soil, stored there from the winter's

Germain's

CERTIFICATE OF QUALITY

MELILOTUS INDICA

TESTED MAY, 1919

Purity 99.35% Lowest Germination 90.20%

Found free from the following noxious weed seeds: Dodder, Star Thistle, Thistles (*Circium spp., Carduus spp., Cnicus spp.*) Morning Glory, Johnson Grass, Hoary Cress and Ribwort.

GERMAIN SEED & PLANT CO.
LOS ANGELES

Every planter realizes the wisdom of buying only high-test seeds. Low-test seeds are expensive at any price. They cost as much to ship, plant and irrigate as the best—yet they produce only a partial crop.

Germain's Melilotus Indica — the most successful cover crop grown—shows an average test of 99 35-100 purity, and 90 20-100 and better for germination.

Orders for Melilotus Indica seed should be placed now while prices are lowest.

Send for samples and prices.

We are headquarters for high-test seeds in all varieties of cover crops.

Liquid Gas

For Citrus Tree Fumigation

Made from Areo Brand Grade X Cyanide furnished by The American Cyanamid Co. of New York

Our plant is nearing completion and will be ready to make liquid gas in any amount required. As previously stated, we have made connections with the American Cyanamid Company of New York, which is going to furnish us with cyanide for our entire output of gas this season, at a price which makee it poesible for us to furnish you the liquid gas at the rate of 60 cents per pound at the plant at Azuea. We will contract to do this in any quantity and the quality will be guaranteed under etate inspection to be 96.98 per cent pure. Containers for same will be sold to you at the plant, at cost. Pumpe will be about the same price ae last year. Delivery hae been arranged for at a price which will cost much lees than you can afford to haul the same for, and this delivery is guaranteed to be satisfactory.

This gaa is made under our patents granted by the U. S. Patent Office, and our improved methods and enlarged plant, built under epecification of the moet skilled engineers and chemists employed by the American Cyanamid Company, make it poesible to render you the eervice that you will require, and our guarantee is backed by them.

We invite you to the plant at any time, and will be glad to show you its workings.

and spring rains. This is Nature's great plant watering tank. We cannot afford to allow any of it to go to waste, beyond those amounts over which we have no control.

For every pound of dry matter produced, both in stalk and grain, corn needs from 250 to 400 pounds of water. These amounts seem rather large, nevertheless they are the results of scientific investigations made by crop and soil experts. Looking at it in another way, from 18 to 20 tons of water must pass through the plants for every bushel of grain produced. This would mean from 8 to 14 inches of rainfall required by the plants alone to produce a 50-bushel crop, not considering that which is lost through the agencies of evaporation, run-off, and seepage. Furthermore, this amount is largely needed during a comparatively short time—about six weeks in July and August.

It is a much safer plan to conserve the moisture already in the soil than to depend upon the rainfall, which is often too slow in coming—during July and August. Both are needed, but the former is a guarantee against the failure of the latter.

Early harrowing puts a dust mulch on the surface that helps materially in checking the loss of moisture by evaporation. This conserved reservoir may be the means of keeping the crop developing normally during drouthy spells in July and August.

The case of spring plowing is somewhat different, but in principle the same. Newly turned soil, if left exposed to drying winds, will lose much of its moisture. An amount equivalent to two or three inches may very easily be lost in this way.

Since the furrow slices are not turned completely over against the bottom of the furrow, air spaces usually remain between the two. They are bad for several reasons.

First of all, air spaces will not permit of a proper root development. The soil must be in close contact with the roots if they are to grow strong and vigorous. Secondly, unless the soil is in close contact with the turned under organic matter, it will not decay as readily. In other words, its manurial values will be held up. Thirdly and very important, a newly plowed soil does not allow for the natural rise of moisture from the soil beneath or the subsoil. To rise properly the soil particles should be in close contact with each other. This might result in the surface soil becoming too dry, with the consequent failure of seeds to germinate or perhaps the death of the roots of those that do.

All of these dangers may be avoided by a judicious use of the roller and harrow. A roller or compactor which does not leave a smooth surface is very desirable. The soil is not only compacted but a dust mulch is provided to prevent losses of moisture by evaporation.

Spring plowed land for corn should certainly be treated in this way for the reasons already given, while for small grains seeded on spring plowing, compacting the soil is always one of the essential steps in seed bed preparation. Our attention needs to be centered upon the corn crop now if the best results are to be obtained.

New Auction Plan

Notification that all receivers and auction companies in New York have decided to block together in auction catalogs has been received by General Manager Charles E. Virden of the California Fruit Distributors. The details of the plan, outlined in a resolution, are given herewith for the information of growers:

Resolved, that all receivers should block together in all auction catalogs and sell, in lots of not less than 100 packages of cherries, apricots, plums, grapes, peaches and half boxes.

That all receivers should block together in all auction catalogs and sell in lots of not less than 80 packages for all lug boxes and full boxes of pears, apples, quinces, etc.

That all receivers should block together in all auction catalogs and sell in lots not less than 40 packages for all kegs, drums and double crates of grapes.

Each grower's fruit will be assorted separately, but should any individual grower in any car ship a lesser quantity than as above specified, all of his cherries, regardless of variety when less than 100 packages, should be sold as one lot.

All of his plums, regardless of variety, when less than 100 packages, should be sold as one lot.

All of his apricots, regardless of variety, when less than 100 packages, should be sold as one lot.

All of his grapes, regardless of variety, when less than 100 packages, should be sold as one lot.

All of his pears when contained in full boxes and less than 80 packages should be sold as one lot.

All of his lug boxes when less than 80 packages should be sold as one lot.

Also that cars containing deciduous fruit of the same growers' mark of the same size and variety shall be catalogued and assorted as two items only. The bulk of the fruit is one line and the second line containing the top tiers.

When a car of deciduous fruit contains one variety, but of two or more sizes, it is agreed to assort and catalog according to size, providing the lots are not less than 100 crates of peaches, plums, pears, grapes and half boxes, and not less than 80 lug boxes of full boxes and not less than 40 crates, drums and double crates.

The above applies to all varieties of fruit,—regardless of size, sizing, number of tiers when contained in similar packages.

Pears in California

More than half the pears in the United States are grown in California. The present year's crop of the United States is now estimated by the bureau of crop estimates to aggregate 7,691,000 bushels. Of this California will produce 4,000,000 bushels. The next largest pear growing state, which is far below this state in total production, is Washington with 1,560,000 bushels. Oregon follows with only a little over a half million bushels. New York is the largest Eastern pear growing state, with 540,000 bushels. This is much lower than her 1918 production, which was 828,000 bushels. On the other hand the Pacific Coast states are all producing far greater amounts than in 1918. Regarding California's place in pear production the bureau of crop estimates says:

California, which is the most important pear state in the Union, has prospects for almost a full pear crop this year. Attention is called to the fact that only about half the total pear production of California is shipped fresh. Approximately 30 per cent goes to the cannery and 20 per cent is dried. The pear crop for 1919 is now estimated at approximately 4,000,000 bushels as compared with 3,814,000 bushels in 1918. Reduced to tons the 1918 crop was estimated at 54,850 tons shipped fresh, 27,500 tons canned and 13,000 tons dried, or a total of 95,350 tons. It now appears that this year's crop will equal and probably exceed that of 1918.

The same bureau's report on other Coast states is:

Washington

The Yakima Valley, which is the principal pear producing region in the Pacific Northwest, and in which the Bartlett is the leading variety, now promises about 2200 cars of pears, or a 15 to 20 per cent increase over last year. The Wenatchee Valley also has excellent prospects and will ship approximately 600 cars. The Western crop moves almost entirely in bushel boxes.

Oregon

The Rogue River Valley, centering about Medford, which is the leading pear region in Oregon, has prospects

for from 700 to 800 cars of 512 boxes each. Bartletts are particularly well set and all other varieties are fairly well set with the exception of Bosc and Howells. The 1919 crop for this region amounted to about 560 cars. The Hood River Valley, best known for its apples, has a limited acreage of pears and promises about 150 cars in 1919. Quality is reported excellent.

Eastern States

New York, the leading commercial pear state of the East, has really only a third of her crop this year. Compared with the 1917 crop of 1,217,000 bushels, this year's half million bushel crop looks small. Expressed in cars it means that this year's output will be slightly over 1000 cars, while the 1917 output was 2720; Niagara, the leading pear producing county of that state, has only 14 per cent of its normal crop. Missouri seems to be going out of the pear industry for the bureau says:

The commercial pear crop of Missouri is rapidly decreasing. Blight and lack of care is causing considerable loss in trees. Pike and Daviess are the leading commercial pear producing counties. Probably not to exceed 50 cars will be shipped this year. Kieffers are principal variety grown.

SAN DIEGO COUNTY FAIR

San Diego County proposes to have a fair. Secretary Mellinger writes that it has been eleven years since the last San Diego County fair was held in Escondido. The Escondido people have held a grape festival annually for many years on September 9. This will be continued and the newly organized fair will be held at Balboa Park in San Diego and will be a general live stock and agricultural fair.

The work of arranging for this event has been promoted by Farm Adviser Weinland and members of the farm bureaus.

GETTING ALL THE BERRIES!

"These are surely the days of the berry picker in Northwestern Washington," says The Packer. Not content to furnish him with tents, free wood and water and free potatoes, one large grower has built houses for their accommodation. Even the picker of wild blackberries is being catered to. This year one packer will select the fastest pickers in his tame berry fields and send them into the highways and byways of Skagit County with tents and necessary equipment. On one farm two-room cottages have been built for pickers. They are well ventilated, have clean bunks, kitchen utensils and a cook stove. There are also community houses with ample kitchens, some accommodating 20 or more pickers. Furthermore, pickers who remain the entire season are paid a bonus.

WAGE SCALE IN VENTURA APRICOT ORCHARDS

A wage scale for the coming season has been set by apricot growers of the Fillmore district. This scale is $3.50 per day for the field workers, nine hours to constitute a day. For pitters, 17½ cents per box will be paid if the pitter remains through the season. Otherwise 15 cents per box will be paid. Growers on the avenue recently agreed on a minimum of $3 for field workers for nine hours and a minimum of 15 cents for the pitters.

CANTALOUPES IN THE SAN JOAQUIN

Cantaloupes from the Turlock district are now going out in carlots. Other cantaloupe sections are opening up. This year 500 acres are planted near Bakersfield in Kern County; also there is considerable acreage planted near Porterville and Manteca.

BIG FIG CROP IN BUTTE

Butte County will this year put out one of the largest fig crops known. The fruit so far has developed under apparently ideal conditions. Picking is expected to start September 1.

ALMOND POLLINATION

The experiment station of the college of agriculture is mailing Bulletin 306 to those who inquire for it. It has to do with almond pollination and is written by Warren P. Tufts. It gives a list of the early bloomers and the late bloomers amongst almonds, the pollen production of various varieties, the relation of the normal set to final crop and a series of tables showing results of cross pollination. Almond growers will find it invaluable.

POLLINATION OF BARTLETT PEARS

Warren P. Tufts of the University of California has written Bulletin 307, "Pollination of the Bartlett Pear." The bulletin is for free distribution by the University of California, Berkeley. Pear growers will find it invaluable.

GROWING ALFALFA

Continued from Page 85

curate for the average producing cow of the Salt River Valley. The hay consumption of 32 pounds per cow per day may seem a little high, but I believe you will agree that waste must be charged against the cow, and that where the hay consumption is large the percentage of waste will be relatively high. Prof. R. W. Clothier's figures show a hay consumption of 27½ pounds per animal unit on the farms coming under his investigation. You no doubt understand that he considers as an animal unit an animal one year old or above. He states that the hay consumption for dairy cows under the farm conditions here varies from 30 to 35 pounds per animal."

Varieties

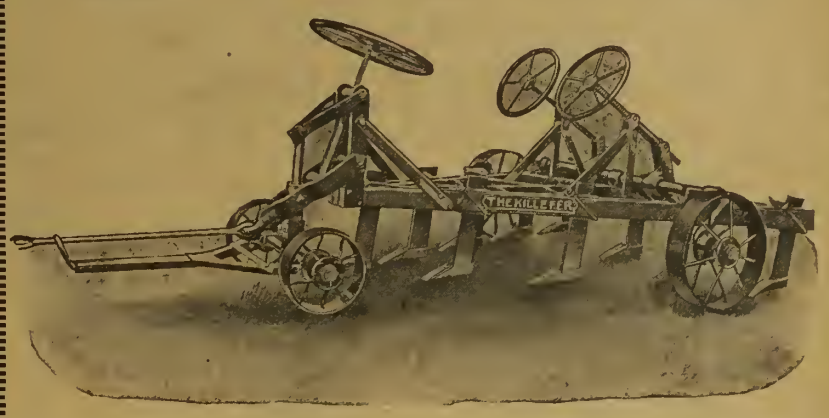
The common variety of alfalfa, or Chilian, has been grown almost exclusively until the past few years. Recently it has been found that the Hairy Peruvian yields from 25 to 50 per cent more, and is claimed to have a higher protein content. C. J. Wood, superintendent of the Mesa experimental farm (a branch of the state experiment station), has been growing the Hairy Peruvian for nearly ten years and he recently stated in a public meeting that ten tons to the acre each year can be produced by growing this variety and following out approved methods.

Tractor Chisel

Catalog No. 60

Killefer Quality

Killefer Efficiency



All authorities are agreed that three elements enter into plant life, viz.: air, heat and moisture and when these are totally or in part excluded by formation of plow sole, due to the old methods of cultivation, just to that extent is plant life cut short in some cases to total failure. How often is heard the statement that certain pieces of land are worn out and will not produce a crop, while we maintain that they are only shut out and by this we mean, that owing to the formation of this plow sole, the elements above named are not allowed to penetrate the soil, which naturally results in partial or total failure of the crop and it has been proven in every instance where this plow sole has been broken by subsoiling or chiseling, that as good or even better crops have resulted from this operation the first season.

Our Tractor Chisel is being used by a great many ranchers who have proven its worth many times over and as one successful rancher said in comparing the cost of plowing with chiseling, "We figure that the Tractor Chisel pays for itself every twenty-three days of continuous operation." This does not include the valuable time saved with the Chisel compared with plows, when so much time is lost in repairs.

Our Tractor Chisel is made from special high grade steel and will stand the strain of the largest tractors. Write for our booklet on Deep Tillage which will tell you what others have done and will do for you. Send for catalogue and prices.

WHY IS JUNE DROP?

Continued from Page 83

available on our ranch, as for 25 years we have found that when we omitted extra applications we have June drop. This is especially true in lemons because lemon wood is softer than orange wood and because there is more flowing sap in a lemon tree. For 25 years we have observed that when our trees were hardened by potash there was less injury from frost, as well as heat. Therefore we have concluded that potash hardens the wood.

It is, of course, more necessary in a well-kept grove than in others. This is illustrated in a neighbor's grove. One corner of this grove contains neglected lemon trees, not pruned nor even properly irrigated. The trees are tough in texture; they did not receive enough irrigating water to make young shoots or water-sprouts of any consequence. They were never forced to bear by fertilizing. This summer not a lemon was dropped there. Not so in other parts of the grove that were properly cared for. June drop there is very bad. Trees seem to be made less hardy by forcing them and giving them proper care.

Mulching and summer cover crops have not been deemed practicable here, so we cannot say how they affect June drop. Time or manner of irrigating seems not to have had any effect in controlling the drop. We pay no attention to blossoming time in plowing or irrigating. Of course we try to keep the soil wet and plow as early as possible, but we always plow when trees blossom, as we give our cover crop a chance to grow in winter and spring. We never have trouble about setting fruit or dropping, providing three things are done: Potash application comes first; the second is fall plowing as well as spring plowing.

One of the chief uses of fall plowing is to cut the feeding rootlets and let them lie dormant until after the spring plowing. The third is to prune with regard to cutting out or breaking off the wood that is not hard, such as suckers and white wood. Leave only hard, fruit bearing wood. At least, prune with this idea in mind that eventually you will get only hard wood. We must work up to this gradually, and keep our ideal in mind.

Soft wood is too tender, nor does it bear the fruit that is really good and worth shipping. Nature takes care that we do not harvest such fruit. Nature eliminates the unworthy fruit on tender trees, in spite of our coddling it with plenty of water and fertilizer. It is our custom here to take out suckers and soft, impure wood at any and all times of the year.

These two superfluities are really detriments, as they take away and monopolize sap that should be at work making fruit branches vigorous and resistant, as well as profitable in fruit bearing.

Quick acting fertilizers, we believe, are of no avail, being unnatural stimulants and not real food. We have never been successful with them.

An interesting fact in the use of potash was found by a friend of mine near Columbus, Ohio, a Mr. Joseph Wetherall. He was the first man there, to apply commercial fertilizers to grain growing. He received immense crops but the stems would not stand up in the fields. Next he applied extra doses of potash, when the stalks stood up straight and firm. Potash, as we all know, is what sustains desert plants. It enables them to withstand the climate. Potash surely hardens. It is an ingredient of glass.

As we look about us, we notice, for instance, a plain, hardy palm, while beside it is a tender, delicate one, which invariably suffers from extreme heat or cold. We find that the former has tough, hard stems, leaves and fruit. Its texture and cells are not so watery and tender as those of the latter. If then, we can, by one or more agencies make our citrus trees more tough and hard in leaf, stem, bark and fruit, we have the ideal tree.

It seems as if these three agencies are necessary; for something is needed to counteract the detrimental effects of the continual fertilizing, irrigating and cultivating which are really unnatural, as they are stimulating. Look at a neglected tree in an abandoned place! How hardy it is! There is nothing to freeze or burn there. But the commercial, growing tree! How different!

* * *

Tulare County growers have had occasion to make fullest investigation of June drop. We believe the experts are now working in that county on that problem. We are glad to have as one of the representatives of that county.

Frank Daybell, Ducor, Tulare County

If I knew exactly how many orange growers there are in California I should probably know exactly how many theories there are as to the cause of June drop. That being the case I have less diffidence in giving my observations on the subject than I otherwise would have.

The dropping of citrus fruits early in the season has become a serious menace to the citrus industry but is in my opinion merely a phase of the problem that now confronts the growers, a problem that is as large as the industry, and on the solution of which some of the ablest men in California are concentrating their efforts.

The causes of June drop are many and include almost all the ills that citrus trees are heir to. Undoubtedly the citrus tree has a decided tendency to shed its fruit when under stress that can only be likened to custom of ancient mariners of throwing overboard the cargo when the ship was in distress.

With citrus trees the causes of distress are many and varied, which may account for the divergence of opinion amongst the growers. Anything that is detrimental to the citrus tree is a contributory cause of June drop and may range from lack of water on the one hand to excess of water on the other. Extreme heat and insect pests can also be included as contributory causes on the same grounds. Some have claimed that late plowing has been harmful and some that no harm has been done.

On our place we plowed some tracts early in the season and some only a little before blossoming time, but can find little difference. We commenced running the water April 1 and can not see much difference between the groves irrigated then and those irrigated one month later. We have noticed, however, that on the groves plowed in the fall and early winter, and which were also irrigated first in the spring, that rather a better crop seems to have set, but the difference is not great.

The situation this year is not normal in that many trees have shown

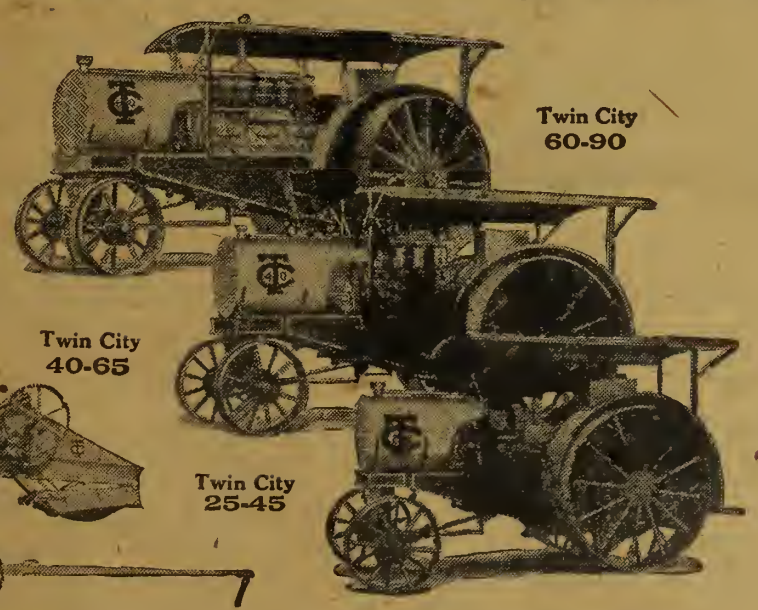
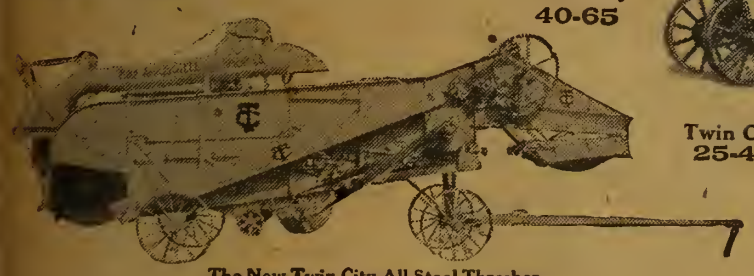
Twin City 12-20—the most powerful tractor in its class

More Power to your Farm

WE GAVE this Twin City 12-20 the opportunity to prove itself a worthy member of the famous Twin City Line on every farm task conceivable. We subjected it to heavy strains seldom encountered in farm work. We are proud to trust it with our reputation and our trade-mark.

Its power and strength are only equaled by its extreme simplicity and ready accessibility. It is a tried and proven success. Built to do the *work—not* to meet a price.





The New Twin City All-Steel Thresher

We say conservatively that the Twin City 12-20 Tractor delivers 25% more than its rated horsepower. It is equipped with the famous 16-valve (valve-in-head), four-cylinder engine which is unrivaled for power, strength and stamina. This double-valve area means complete clearance of burnt gases; a pure fuel mixture, and therefore more power and lower fuel cost.

Other important features include: removable cylinder sleeves; counterbalanced crankshaft; spur-gear transmission (running in oil) with two forward speeds, direct drive on both. Though completely enclosed and dust proof, there is quick and easy access to all moving parts.

This tractor is built by one of the largest tractor organizations in the world. This is important to every farmer. Write today for full details.

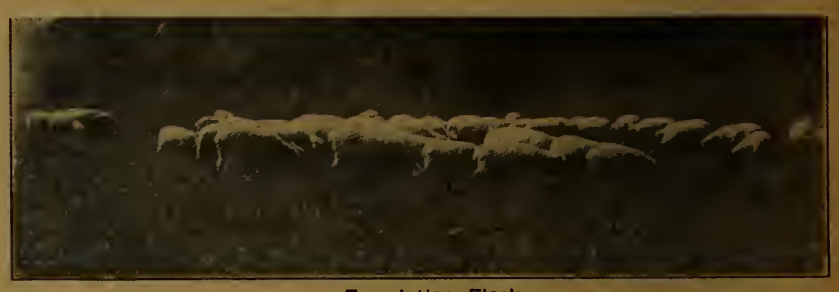
A Ranch with a Story and a Mission

By R. P. Royce

DURING the Panama-Pacific International Exposition the press agent of a certain Middle West state issued a booklet setting forth in approved press agent style the varied resources of his state. Particular importance was given to the position occupied by his commonwealth in agricultural and livestock affairs. Without attempting to recount all the claims made, we remember that some of the statements were to the effect that his state owned more Shorthorn cattle than the British Isles, more Jerseys than the Isle of Jersey, more Guernseys than the Isle of Guernsey, more Clydesdale and Shire horses than England and Scotland and more Percherons than France. The booklet was brought to the attention of a prominent livestock man who had some regard for facts and he inquired of the press agent if what was said happened to be true. The exuberant writer replied that he did not know, but added that "it sounded all right."

We are reminded of the above after a visit to Glenn County—not that Glenn County is making any sort of claims just because they "sound all right," but because Glenn County is working toward the time when it can truthfully be said that Glenn is the leading live stock county of the state. Glenn County doesn't make such sweeping claims as yet, but it is claimed that they have more registered Berkshires than any county in the United States. They also believe that they have as many individual owners of registered Shorthorn and Jersey cattle, Duroc-Jersey swine and Shropshire sheep as any California county—and the Poland-China breeders are out to make an equal record.

When any movement starts and continues to grow it is usually found that back of all is a story of a lot of hard work and persistent effort on the part of a few, and when the real story of Glenn County's livestock development is told it will be found that the stimulus was furnished by a few, among whom no one has rendered higher service or is entitled to more credit than W. S. Guilford. The mention of Guilford always brings to mind the Butte City Ranch, and because the development of this ranch should be an inspiration to all and is an example of the possibilities that are still open to all if they take the time and have the courage to seek them out, the story of the ranch is worth the telling.



Foundation Flock

Butte City Ranch has found Shropshire sheep highly profitable and has been responsible for the establishment of many small flocks in Glenn County.

In 1910 W. S. Guilford—Billy Guilford or Gil to nearly every one in the Sacramento Valley—came to California as director of agriculture for the Superior California Farm Lands Company organization that had under development 130,000 acres in Glenn County. Guilford was not long in reaching the conclusion that if a sound agricultural development was to be registered livestock of all kinds must be given a large place in the general scheme of operations, and having a wide and intimate knowledge of the livestock industry he knew that the better the livestock the better the business. From the first he talked livestock, and because he recognized the opportunity the new community afforded for making a center of pure bred livestock, he talked and promoted the establishment of pure bred herds, not herds of any particular breed, but pure bred livestock. As the community developed and interest in livestock grew, it became apparent that there was a real need for an establishment near at hand that could supply the demand for breeding stock—hence Butte City Ranch and this story.

The Sacramento constitutes most of the eastern boundary of Glenn County, and practically the entire length of the county is leveed, the levee running very close to the river. Just opposite Butte City, which is on the east side of the river is a tract of about 750 acres between the river and the levee, that for years—probably since the "memory of man runneth not to the contrary"—had been idle The entire tract was covered with a dense growth of heavy timber and underbrush so thick that in places it was difficult to make one's way. Almost every year during the spring the back waters of the river at flood time would overflow all the tract except a small knoll and leave a deposit of the best soil in the world. These annual overflows had naturally added greatly to the fertility of the land, and the fact that it was overflow land and covered with trees and brush had not made the place attractive to the land seeker, there being plenty of good land that could be put in cultivation with less effort. Accordingly the value placed on the land was low as compared to the land protected by the levee. On the whole it was not a particularly attractive proposition, but it looked good to Guilford, and the fact that it would require a lot of hard work did not deter him from tackling the job. In 1913 he interested W. P. Dwyer of the California Transportation Company in the proposition, and together they took over the place and started work, to literally carve out a farm. Clearing operations were begun and continued until at present about 300 acres are cleared and in cultivation.

From the first their plans contemplated fruit growing in connection with their livestock operations, and orchards of prunes, pears and walnuts were set out. Today about 180 acres are in fruit, 80 acres in prunes, 30 in Bartlett pears, and 70 in Eureka walnuts and a few acres in pecans. The oldest trees are now five years old and are the marvel of all who see them. So fertile is the soil that the trees have made a growth equal to most eight or ten-year-old trees. Another point of interest is the fact that the trees are subjected to scarcely any heavy pruning, the owners, proceeding on the theory that conditions of moisture and soil fertility are so nearly perfect that best results are obtained by permitting natural development of the trees. During the past five years the trees have been under six to ten feet of water, for varying lengths of time during three years. Most of the orchards are producing alfalfa between the trees. About 100 acres are producing alfalfa for hay and pasture, and owing to sub-irrigation it has only been necessary to irrigate a few times. Eventually about one half of the place will be in orchards and the balance in alfalfa, corn and other grain crops. No barley is being produced.

Before taking up the livestock activities of the farm, it will be interesting to describe the methods used in clearing the land. As stated above, much of the place is covered with a dense growth of underbrush. Guilford has found that the most practical way, and at the same time profitable way, of handling the brush is to run hogs, sheep and cattle. Hogs and sheep are first turned in to clean up the smaller stuff. Cattle come next, and by the time they are through, most of the brush is out of the way and only the heavy timber is

She Lives in Glenn County

Some day there will be many small herds on Sacramento Valley ranches, supplying stock like this to ranges and large farms. This is Bracelet's Beauty 2d.

left to be cleared. As fast as the hogs and sheep open up the brush, grass makes its appearance, and when the cattle are put on they have good forage of grass and brush missed by the first stock. Several hundred head of stock are maintained and fattened with little expense by the above plan.

The first venture made with pure bred livestock was with Berkshire swine, and the herd has been largely responsible for the position occupied by Glenn County as a Berkshire center. Subsequently a herd of registered Shorthorn cattle and a flock of registered Shropshire sheep were established. Guilford is an ardent believer in pure bred livestock of all kinds, but he has never allowed himself to lose sight of the fact that utility is the essential of all breeding operations, and he has at all times followed the policy of managing and maturing his herds and flocks under as near natural conditions as possible. This does not mean that they are turned loose to shift for themselves, but it does mean that they are not pampered and developed under conditions that often render breeding stock unsatisfactory when in the hands of purchasers. With plenty of range for exercise, and abundant forage, thrifty, healthy stock is produced.

In the establishment of the various herds and flocks it has been the aim of the owners to buy as good blood as possible and to dispose of the produce at prices that beginners and small operators could afford to pay. They have also made it a point to assist beginners in developing their herds and to dispose of the surplus. At present about 125 head of Berkshires, 125 head of Shorthorns and 300 head of Shropshires are maintained. At the head of the Berkshire herd are the following boars: Butte City Leader, a grandson of the famous Grand Leader 2d, and Onward 4th, a son of the imported boar, Epochal. Victor Stamford, a son of White Rock, and therefore a grandson of the noted Whitehall Sultan, stands at the head of the Shorthorn herd. The Shropshire flock has been built on Minton, Cavendish, Wardwell and Broughton breeding.

Until this year practically all the surplus stock was disposed of at private treaty, but from now on the owners plan to hold at least two annual public sales at which representatives of the breeds handled will be sold. A spring sale was held and a fall sale is under way. This method of selling is proving highly satisfactory to both sellers and buyers.

So much for the actual operation of the ranch There is a bigger story, the story of influence exerted by the Butte City Ranch on the livestock development of Glenn County in particular and Northern California in general.

To say that Butte City Ranch deserves entire credit for the remarkable strides made in livestock affairs by Glenn County would be putting it too positively, but to say that the ranch has been one of the powerful factors in such development is quite within the facts. Butte City Ranch has served to encourage Glenn ranchers to regard livestock raising as a necessary and profitable adjunct to their operations. It has stood for and furthered the cause of pure bred live stock regardless of breeds. It has proven that livestock production is a profitable business, a clean business and a dignified business. It has served as a source from which beginners could secure foundation stock. On every hand the owners have lent their aid and advice to every movement that touched livestock affairs. By adopting a broad and friendly attitude toward all breeds they have stimulated such an attitude on the part of others. They have preached the value of local shows and organizations and of boys and girls pig clubs and calf clubs. They have left no stone unturned to promote in every way the cause of better agriculture and a better citizenship. And because of all they have done they have been given, and hold, the confidence of the community in which they operate. The establishment of such a ranch on land that was not in use has added to the wealth of Glenn County and stands as proof of the possibilities and reward of well directed honest effort. Glenn is a better county today because it is the home of the Butte City Ranch.

An Opportunity to Buy Hampshire Bred Sows and Gilts Ortega-Underhill-Rancho Santa Barbara, Wed., Aug. 6

Do You Know?

1. That Hampshires are prolific, good mothers, unexcelled as rustlers, make rapid and economical gains, mature quickly and dress out high?

2. That at the 1918 International Livestock Exposition Hampshires won the grand championship for carloads?

3. That Hampshires have made more progress during the past ten years than any other breed?

4. That Hampshires are the most profitable hogs because of the above facts?

Announcement

In announcing this sale of Hampshire boars, bred sows and gilts, which will afford the buying public of this state the first opportunity to purchase at public auction Hampshire breeding stock, it is not out of place to make a brief statement concerning the herd from which the offering is drawn. When I determined to establish a herd of pure bred swine I had absolutely no prejudice as to any breed. What I wanted was the breed that would make me the most money for the feed and labor expended. I therefore conducted a most careful investigation of all the leading breeds. I took no one man's word. I talked to hundreds of successful hog men. I took up the question with the leading packers. While all did not agree, the majority of opinion thus gained led me to select the Hampshire. Once having determined on the breed I made equally as searching investigation of the most popular blood lines of the breed—the lines of breeding that the records indicated were producing the most desirable types. I then set about assembling a herd that represented these blood lines to the highest degree. The question of price did not enter into the selection. I wanted the best and was willing to pay for them. I have never had cause to regret my selections and through this sale I am certain that I will find ample justification. My hogs have proven money makers for me and I know that they will prove equally profitable to others. I take pleasure in inviting you to attend this sale.—Francis T. Underhill.

The Herd Boars

GENERAL TIPTONS MASTERPIECE, a son of the famous GENERAL TIPTON, and counted his best son. There is no better boar within the breed and his ability as a sire is unquestioned. We recently refused an offer of $3000 for this boar. Many of the sows and gilts are sired by or bred to him.
EXALTED RULER is a line bred LOOKOUT, being sired by EXALTED LAD and out of LOOKOUT QUEEN. We believe he will develop into one of the largest boars of the breed.
ROD, sired by LIEUT. MESSENGER, is considered by Secretary Stone to be one of the best fall yearlings he has seen. A number of the choice sows are bred to ROD.
DRAPER LADDO is by DRAPER LAD first in the aged boar class at the 1918 Iowa State Fair. He combines the best blood of the breed and was considered one of the best junior yearlings of last year.
GENERAL ALLEN'S COUNTERPART was selected by Secretary Stone as being the best boar calf last year in the great Crouch herd.
ADMIRAL BLYTHEDALE is a son of the famous BLYTHEDALE JIM, one of the greatest sires of the breed.

The Offering

includes 65 head of bred sows and gilts, and consists of 27 young sows, 21 yearling sows and 27 fall gilts. The entire lot has been selected and prepared for sale with great care. All are either bred to or sired by the above boars. As a whole we are proud of them. They have plenty of size and bone combined with that high degree of quality for which the Hampshire is noted. Established breeders or beginners will find this sale an excellent opportunity to buy at their own price foundation stock of outstanding merit. Practically every sow or gilt will be carrying her own guarantee by sale day, and every animal sold is positively guaranteed to be a breeder and with pig. The mating of the sows and gilts to the boars to which they have been bred has been done as though they were to stay in our own herd. Satisfactory litters are assured.

The sale will be held on the ranch, four miles East of Santa Barbara on the Coast Highway, near Montecito. Free barbecue. For catalog and other information address Walter Folk, Western representative of the American Hampshire Record Association, in care of the Ortega-Underhill Rancho, Santa Barbara.

Col. Ord L. Leachman, Sacramento, Auctioneer.

Hampshire Breeders To Organize

During the morning of the sale the California Hampshire Breeders Association will be formed. Every one interested is invited to join. Secretary E. C. Stone will be present.

Remember The Date and Place Plan To Be Present Ortega-Underhill-Rancho Santa Barbara, Wed., Aug. 6

Prince Walker Cornucopia

The Highest Record Son of Prince Gelsche Walker

His dam: ALBA SADIE CORNUCOPIA CREETA has just completed official records of 36.26 pounds butter from 516.7 pounds milk in seven days. Her previous records were as follows:

At seven years—
Milk 338 days.....18,849.40
Butter 866.28
At six years—
Butter seven days 34.13
Milk 532.40
At five years—
Butter seven days 28.85

She is a daughter of Sir Sadie Cornucopia, son of the first 30 pound cow, Sadie Vale Concordia.

Over 60 of our best females are bred to PRINCE WALKER CORNUCOPIA, and he will be given the fullest opportunity in this herd. Put one of his young sons at the head of your herd.

The Necessity of a Higher Producing Cow

The following is part of an address delivered before the meeting of the California Dairy Council, San Francisco, July 8, by H. Brown of the Burr Farm, Los Angeles. Mr. Brown has been largely responsible for changing a losing dairy into a very profitable plant.—Editor.

THERE are fewer cows in the country at the present time, than some years back. The high price paid for beef, together with the high price of feed and labor has forced the dairyman to sell his unprofitable cows to the butcher.

Scientific research has discovered that there is nothing to take the place of the butter fat in the milk, for the human being. Business men who are not slow to take advantage of what benefits them, are advertising this fact to the world and it is increasing the demand for whole milk in the cities to a greater extent than ever before.

The main reason for the necessity of a higher producing cow is the fact that it would be impossible to produce and sell milk at present prices, with a cow of twenty years ago. Feed and labor are three to four times as high as they were at that time, consequently it is necessary that the dairy cow be bred for production and production alone. We might as well try to grind wheat with the old time millstone as to try to produce sufficient milk for the world with a scrub cow.

Farms must be operated to supply people with food. Many farms are so situated from the market that they must produce a product that can be marketed in a concentrated form and there is nothing that will take raw farm products and convert them into a high priced article as will the dairy cow.

Farmers have been making a living on the dairy farms, but when the cow testing association came along and kept records of the different cows it was found that a good many things had to be corrected, and the chief thing was to get rid of the low producer as she did not pay for her feed and labor. A better producing cow had to take her place.

The Iowa state college in experiments with common cows showed that they produced only about 175 pounds of fat per year from 4,000 pounds of milk. Their daughters from purebred sires show a production of over 5,000 pounds of milk and 250 pounds of butter fat.

The health offices of the various cities and states are enforcing necessary sanitary regulations that make milk production more costly, and it is up to the cow to produce more cheaply in order to meet this expense.

This question of the necessity of a better producing cow was a very pertinent one to us in 1917 when we purchased a 300 cow dairy in order that we might have milk for the city trade. This dairy was producing less than a half a pound of fat per cow, which did not pay for the actual feed consumed and the labor, let alone the incidental expense and depreciation in interest on the investment. We knew it was absolutely necessary to get greater production at once and went to work with this in view. The milk of each cow was weighed and tested. The cows were stabled according to production so that each cow could be fod the proper ration to bring up her production. By weeding out the poor producers we doubled the production of the herd within a year and changed the operation of the place from a loss to a profit. We knew the great benefit of the cow testing association and were instrumental in getting one organized and for the past year have had the benefit of that work which has helped greatly in building up the herd.

Last year there were 200 cows in the cow testing association of Los Angeles. This year there are 2,800 cows signed up.

The first sale in Southern California, at which the records from the cow testing association were used was at our sale in February of this year. This sale made an average of over $200 per head, the highest average in that part of the state for grade cows.

In our herd almost every cow without exception is showing an increased production this year over last on account of having been fed properly the past year. In a great many cases we are showing as high as 100 per cent increase, especially where cows had been fed no grain the year previous to putting them into our herd. This proposition of getting higher producing cows is past the experimental stage. The many purebred cows of all breeds are producing up to 20 pounds of butter per week and a great many Holsteins as well as other breeds producing over 1,000 pounds per year.

An architect in building always looks to the foundation and so constructs his building that it will sustain the load it has to carry. I believe the same thing should be taken into consideration in the building of the Dairy Council. In planning its work the greatest consideration should be given to the development of a higher producing cow.

My work has taken me out among the dairymen, both the experienced man who knows how to make a profit and the beginner who has everything to learn. Only last week I had a letter from a woman asking me why she didn't make a profit and how she could. She had cows that were giving from a gallon to a gallon and a half a day. That woman wants to go ahead with the dairy business but how can people like her continue unless the Dairy Council reaches them with the right kind of information. The farmer should be taught to keep books on his cows and also their proper feeding and breeding and when he changes from grades to purebreds he must keep his registration papers and certificates in a proper manner.

I am sure there is going to be a greater demand for milk and milk products than ever before, but in order to get this milk the farmer must have a cow that is a big producer. We can not lose and we are bound to win if we get this better producing cow, and it is up to the Dairy Council to help. This they can do by helping to organize cow testing associations; by seeing that purebred bulls are used in every herd in the country; by helping along with cow and calf clubs; by putting dairy papers into the couutry schools and by teaching the farmer the proper feeding of his cattle. One of the best ways of all is to see that there is a representative exhibit of dairy cattle at every fair or show held in the state of California.

LEGUMES, SUDAN GRASS AND CEREAL CROPS FOR SILAGE

The wide use of the silo as a means of preserving corn for feeding purposes has aroused interest in the possibility and advisability of utilizing the same method as a means of preserving other forage crops. With some of these crops, especially those belonging to the sorghum family, and including ordinary sweet sorghum, kafir, milo and feterita, when the necessary conditions are observed, the results are practically as successful as with corn. For others, especially those of the legume family including clover, alfalfa, field peas, cowpeas and soy beans, the results have not been uniformly successful. In University of Missouri Bulletin 162, C. H. Eckles discusses these various crops for silage and comes to these conclusions.

Under proper conditions legume crops may be preserved in the silo with entire success, but as a rule they are best preserved as hay on account of the much greater weight to be handled if put into the silo and the lack of suitable machinery for handling the green crop in the field. When conditions make it advisable to put legumes in the silo, in addition to ordinary precautions concerning exclusion of air special attention is necessary that the proper amount of dry matter is present in the material.

For proper preservation in the silo a dry matter content of approximately 40 per cent gives the best results. Legume crops in the stage of maturity as cut for hay may contain as low as 20 to 25 per cent of dry matter. If put into the silo under these conditions the silage will have an extremely disagreeable odor when removed and be almost worthless for feeding purposes. The wide variation in results from using legumes for silage as reported in agricultural literature is largely explained on the basis of the dry matter content of the materials used.

Sufficient dry matter to insure proper preservation may be assured by allowing the crop to reach a suitable stage of maturity before cutting, or in case the crop has not reached the stage of maturity necessary to insure the dry matter content desirable, by allowing the forage to lie in the field five to six hours after cutting before putting into the silo.

Alfalfa can not ordinarily be allowed to stand in the field until the proper stage of maturity is reached, and except in a season of drouth when the dry matter content of the plant is abnormally high, it should be allowed to lie in the field four to six hours so that some of the surplus water can evaporate.

Canada peas and oats are in condition to go into the silo when a stage of maturity is reached where the pea pods are becoming yellow and the oat heads are showing the first indications of ripening.

Soybeans are in the proper stage of maturity for silage when the plant shows signs of approaching maturity. The beans should be well developed and the pods beginning to turn yellow.

Cowpeas should show the same conditions as described for soybeans. On account of the wide variation in condition and time of planting it is often necessary to put cowpeas in the silo before the proper stage of maturity is reached. Under these conditions partial drying in the field is essential to good results. Silage from legumes is superior in protein content, but somewhat inferior to corn silage in total digestible nutrients. With a proper amount of dry matter present the loss of feeding value while in the silo is no greater with silage from legumes than with silage from corn.

Sudan grass is preserved readily in the silo with no special attention necessary to the amount of dry matter. Its feeding value will range from two-thirds to three-fourths that of good corn silage depending upon the maturity of the crop when put into the silo.

Wheat is used to some extent for silage and supplies a silage of reasonably good quality, having a feeding value approximately the same as corn silage. It should be put into the silo when the wheat grains are in the dough stage. No special precautions are necessary to insure a proper preservation.

Rye may be preserved readily in the

Fresno Duroc Breeders to Organize

The Duroc-Jersey breeders of Fresno County will meet in Fresno August 2 for the purpose of perfecting an organization for the advancement of their chosen breed of swine.

The organization will encourage the present breeders and assist beginners in securing the right kind of foundation stock. A little later arrangements will be made for holding a public sale which will be made a permanent feature.

Much Interest in Underhill Hampshire Sale

The first public sale of Hampshire swine ever held in California will occur at the Ortega-Underhill Rancho, the property of Francis T. Underhill, near Santa Barbara, on Wednesday August 6. The event is attracting more than ordinary attention for the reason that it is not only the first opportunity California breeders will have to buy representative Hampshires at auction, but because of the high excellence of the herd. When Mr. Underhill decided to enter the hog business he selected the Hampshire breed, and it is doubtful if any herd has been assembled with greater care than Mr. Underhill gave in the selection of his foundation stock. The blood lines on which the herd has been built are the recognized sources of the best animals, and each of the herd boars represents in a way a distinct line of breeding. Consequently it is expected that a careful blending of these lines, as determined by experience, will produce a superior class of animals. There is no denying the fact that Hampshire swine have made a phenomenal growth during the past ten years and that their popularity is increasing, and because this breed is destined to take an important place in the swine industry of this state California breeders congratulate themselves on having such a superior herd from which to draw breeding stock.

It is expected that the sale will attract a very large crowd and it is planned to make the day a real Hampshire event. During the morning of the sale the California Hampshire Breeders' Association will be organized and Secretary E. C. Stone will be present to lend his aid, advice and enthusiasm to all. A barbecue lunch will be served.

The sale will consist of 65 head of sows and gilts, all of which will be sold bred to one or another of the famous herd boars owned by Mr. Underhill.

Col. Ord L. Leachman of Sacramento will be the auctioneer, and Walter Folk, Western representative of the American Hampshire Record Association will manage the sale.

Inaugural Sale of Poland-Chinas

The inaugural sale of Poland-China swine of the Fresno County Poland-China Breeders' Association will be held on the Fresno fair grounds Wednesday, August 20. The committee appointed to select the animals eligible for this sale have made their report to the secretary, Walter C. Ficklin, who states the animals selected meet the requirements and standard set by the association. The Fresno County Poland-China breeders have been liberal buyers at past sales held in the state and have imported a large number from the leading Eastern herds. As a result they believe their offering should attract a large number of buyers and that the animals to be sold will return a handsome profit to their purchaser.

Will Hold Berkshire Sale in August

W. M. Carruthers, Live Oak, who recently held the record breaking sale of Shorthorns at Sacramento, has announced that on August 20 he will sell at public auction 65 head of registered Berkshires. The offering will include a number of boars and a particularly choice lot of bred sows and gilts. The sale will be held at Carruthers' Farms, Live Oak.

Cut the Cost with Silage

RIGHT NOW is the time you need an Ideal Green Feed Silo. Mill feed is high and likely to remain so. The farmer or dairyman who owns a silo is not only saving money on his feed bill, but is getting one-fourth more milk from his cows than the man who has to use dry feed altogether.

Summer or winter you will find this silo a profitable investment. It maintains an unfailing supply of juicy, succulent feed at the lowest possible cost. No other one item of farm equipment will return so much profit on the money invested.

The Ideal Green Feed Silo

will make your farm or dairy one hundred per cent. efficient. It eliminates all waste and enables you to produce six to eight times more feed per acre than could be raised without a silo to preserve it.

The choicest California Redwood is used in the construction of the Ideal Green Feed Silo. Tongue and groove staves of selected tank stock insure a perfectly joined, airtight container. Heavy round hoops of soft steel, set 30 inches apart bind the staves into a rigid circle. Long cold-rolled upset threads, provided with heavy hexagon nuts and our heavy malleable iron straight-pull lugs, permit easy adjustment and add to the life of the silo.

Refrigerator Doors

The doors on the Ideal are of the refrigerator type, interchangeable, and held in place by strong oak locking bars. **No other silo has doors like them.** They fit in the frames like the doors of a safe or a refrigerator, only they have no hinges. Three points of contact make them airtight and leakproof. Inside they are flush with the walls of silo, thus doing away with all danger of air pockets.

Many special features of the Ideal, together with high-grade material and skilled workmanship, make it the most perfect silo ever built. Our silo catalog, giving full particulars and prices, is yours for the asking.

Water Brings Wealth

It is just as foolish to try to get along without a water tank as it is to do without a kitchen stove. **A Pacific Redwood Tank** will provide water for all your needs—for your household as well as your stock. Used for irrigation purposes, it will pay for itself many times over through increased production.

Pacific Redwood Tanks are equipped with patent non-shrinking system, which absolutely prevents leakage. Let us tell you more about them.

We also manufacture **Pacific Wood Stave Pipe,** in various sizes, for every purpose. Ask for our pipe catalog.

THE BIG AUCTION SALE

Butte City Ranch

Owned by W. P. Dwyer and W. S. Guilford

Butte City Glenn County California

Saturday, August 2, 1919

Buyers who want foundation breeding animals of excellent quality will find a good selection in this offering. The owners of Butte City Ranch expect through their annual sales to sell from their herds and flocks the sort of animals that will prove profitable in the hands of new owners and bring them back again as buyers in the future.

50 Registered Shorthorns

The offering of registered Shorthorns is an especially well balanced one. There are big, thick fleshed cows with calves at foot, bred and open heifers, and some choice heifer calves. Most of these are by such sires as Victor Stamford, Vermillion, Gloster Archer, Roan Chancellor, Crescent Dale, Gibson's Goods, Ringleader, Perfection and Sir Type. All of the bred females are in calf to Victor Stamford, who is by one of the best sons of Whitehall Sultan and out of a Stamford dam. An excellent opportunity will be found among these females to

There are big prices. There are 12 young bulls in the sale, a desirable offering throughout, and they are all in vigorous, thrifty condition. Breeders and rangemen will be pleased with this selection.

Every animal tuberculin tested; every animal sold as a single lot guaranteed to be a breeder; every young animal permanently immunized against blackleg by Purity Blackleg Aggressin made by the Kansas process.

130 Registered Shropshires

Breeders who already have established flocks will like these Shropshires and can find among them a wide selection that would add strength to any flock. Those about to establish flocks will find in this offering the sort of animals to use for foundation. The farm flock can be made one of the most profitable items on most California farms, and in the aggregate one of the largest sources of farming revenue. The animals in this sale represent Broughton, Cavendish, Minton, and Wardwell breeding, and are of very desirable type besides being in splendid physical condition. The owners of Butte City Ranch selected for this sale 35 of their very best mature ewes, 40 ewe lambs, 35 yearling rams, and 20 ram lambs.

50 Registered Berkshires

Seldom does the buyer have an opportunity in a public sale to select registered Berkshires of such uniform breeding as will be found in this offering. The entire 50 head are sired by two boars, one of them Onward 4th, son of the famous imported English boar Epochal, the other Butte City Leader, a grandson of the world's grand champion Grand Leader 2nd. Both of these boars are famous for the size, smoothness, and quick maturity of their get, and Butte

City Ranch is offering well grown gilts and young boars of more than usual attractiveness. These blood lines are sought after by the best breeders in the country and beginners can make no mistake in founding herds bred along the same lines. Every Berkshire in this sale is permanently immunized against hog cholera by Purity Hog Cholera Serum and Mixed Vaccine.

10 Shetland Ponies

Butte City Ranch Shetland Ponies are justly held in high esteem wherever they are known, and this is one of the very few places in the west where these splendid miniature horses may be purchased. Some of the best on the ranch have been selected for this sale.

GENERAL INFORMATION—The sale will start promptly at 9:00 A. M. owing to the large number of animals to be disposed of in one day; all animals will be loaded on board train or boat free of charge; Butte City Ranch is 80 miles north of Sacramento, 19 miles north of Colusa; 16 miles southeast of Willows, 25 miles southwest of Chico.

STERILIZER FOR SMALL DAIRY

The Western office of the dairy division of the United States department of agriculture offers the following instructions as to how milk can be cheaply and efficiently cooled:

As the warm weather comes on complaints about loss of milk through souring are to be expected. It is now recognized that one of the principal causes for loss of milk through souring is inadequate sterilization of utensils. This fact has long been recognized by the managers of city milk plants and large concerns and adequate equipment has been installed for the purpose, but both dairymen and dairy officials and instructors have not known of practical and cheap equipment for sterilizing, suitable for the small dairyman. This difficulty is now entirely overcome and equipment both cheap and thoroughly practical may be had.

C. F. Hoyt, market milk specialist, reports that Mrs. B. F. Van Dyke of Madford, Oregon, devised a sterilizer for this purpose several years ago. She did this by placing a false bottom in an ordinary clothes boiler. She then placed a little water in the boiler and placed her milk bottles and other utensils on the false bottom and steamed them by causing the water to boil.

The same sort of a sterilizer was devised by a dairyman near Los Angeles. Its value was recognized by the Los Angeles city inspectors. Largely through their activity the use of this sterilizer became general in this section and goes far to account for the high quality of milk produced there. It consists simply of a box of galvanized iron which may be placed on any source of heat. A stock size carried by dairy supply houses is 29 by 29 by 29 inches and the price is $8.00.

A modification of this box sterilizer has been made by Mr. J. E. Hathaway, a dairyman of Norwalk, near Los Angeles. For the galvanized iron box he substituted a box having cement sides and a thick iron bottom, which he heats over a wood fire. He built a foundation of cement and on this foundation placed an old kitchen sink of perhaps one-fourth inch thickness.

Then he built up his box of cement on woven wire from the sides of the sink, and placed a cover on the top. The walls of the cement box were about one inch thick, and inside dimensions 24 by 28 by 32 inches. He used one sack of cement, costing two dollars and did the work himself. For this kind of a sterilizer there is no cost save for the cement and the discarded sink. Mr. Hathaway has used this sterilizer about a year now with complete sucess. He believes it cheaper and more durable than the galvanized iron sterilizer in general use.

FIVE RULES FOR SUCCESSFUL DAIRYING

Jake White, veteran dairyman of Ohio, recommended to a group of dairy students the other day the following practices which he says have been largely responsible for his success:

Buy a purebred sire, a few good cows, and improve the herd by breeding.

Feed a ration that is palatable as well as balanced.

Keep the herd free from disease by rigid sanitation and by introducing few new animals.

Keep the cows quiet and satisfied, if you want big milk production.

Go after the business hard. Don't be afraid to borrow money.

Mr. White has been in the dairy business for over 25 years, and has had no competitor for years in supplying his home city of 4,300 population with 2,000 pints of milk a day from 115 to 120 of his purebred Jersey cows.

MILK GOOD FOR LUNCHES

In a certain town in Illinois a factory employing 1,400 men has recently introduced the plan of permitting milk venders to go through the plant at 10 and 3 o'clock each day with sweet milk and buttermilk. Most of the men buy a pint each time. The foreman stated that since the drinking of milk has become so popular with the men not only is their efficiency improved, but they are more contented and even tempered.

In New Haven, Connecticut, the manager of one department store had posters made entitled "Why we should drink milk," and sold six milk tickets for 25 cents to the employees, no attempt being made to show a profit on the sales. Half pint bottles of milk were distributed to the clerks in the middle of forenoon and afternoon. Straws were furnished with each bottle of milk, as the manager believes that too often people drink milk too fast, causing bodily discomfort.

MORE BARLEY FOR FEED

With the elimination of the brewery industry a considerable amount of barley which has been consumed in beverages will be available for feeding purposes—especially for hogs—says a bulletin sent out by Armour and Company.

"In sections where barley is available," it is stated, "farmers can get good results by substituting barley for corn in the hog ration. In a recent test at the Wisconsin experiment station twelve lots of pigs were re-fed, using ground barley in the ration. The return for each pig over the cost of feed was $14.38 for the barley-fed pigs and $12.38 for the corn-fed pigs.

"Interesting facts were brought out in this experiment as to how barley might be used in various combinations, one being barley and whey, which netted a handsome return, due to the quick gains made."

TESTING CALVES FOR TUBERCULOSIS

Calves may become infected with tuberculosis at an early age, and any effort to eradicate this dreaded disease from the herd should not overlook the younger animals. Diseased stock may undoubtedly transmit the ailment to calves by association with them in the same stable or feedlot and even by contact through a fence which divides the younger from the older animals.

The youngest age at which department veterinarians recommend testing calves for tuberculosis is six months. In special instances, however, numbers of animals under this age have been satisfactorily tested with tuberculin. The present regulations of the bureau prescribe a dose of two cubic centimeters of tuberculin for calves ranging from six months to one year of age.

BIG INCREASE IN HOG ENTRIES

Chas M. Paine, secretary of the California state fair, says that to date more than 1000 entries have been made in the swine department. This phenomenal increase indicates the great strides that the hog industry is making in this state and presages the greatest hog show ever held in the West. Paine states that he expects more entries, but that he is hard pressed to find pen room for those already entered.

CARE IS NEEDED IN GIVING SALT TO HOGS

Salt poisoning of hogs is not of rare occurrence, according to an article by H. C. H. Kernkamp, University Farm, St. Paul. Pigs, says Mr. Kernkamp, should not be given salt as other farm animals are. Whenever salt is used for pigs it should be mixed with the feed or used as one of the ingredients of a tonic or conditioner. It should never be placed in a container alone where the hogs have free access to it.

BUFFALO GNATS

This pest of early summer is one of the worst biting insects we have. In swampy land they sometimes become so numerous as to make pasturing an impossibility. The eggs are deposited in shallow streams, the larvae attaching themselves to sunken logs or stones and there remain feeding on material which the current carries to them.

The only known preventive is cleaning and deepening the stream channels, for the gnat breeds only in shallow water.

Tulare Duroc Sale a Success

July 16, the Tulare County Duroc-Jersey Breeders' Association held its second annual sale at Tulare Fifty-nine head were sold for an average price of $119 with a top of $300 paid by Alex Whaley of Tulare for No. 6. The sale was additional evidence of the determination of the pure bred live stock breeders of Tulare County to make their county one of the leading livestock centers of the state. The sale was the first to be held in the new livestock sale pavilion which was recently completed through cooperative effort on the part of the breeders and the business men of Tulare.

Quite different was this sale, as expressed by several of the older breeders, from the first sale held last January. At that sale considerable difficulty was experienced in gathering a consignment of 30 head, but in this sale twice that many were secured with ease.

The sale attracted breeders from all parts of the state and while the majority of the animals went to found new herds, a goodly number were purchased by old and established breeders. Among the breeders present from a distance were: W. R. Gatton, manager of the Diamond Bar Ranch, Spadra; M. C. Allen, Winsor Ranch, Bonita; Elmer Lamb, Ceres; Harvey M. Berglund, Dixon; Clayton Slocum, Willows; F. D. Burr, San Francisco. Other prominent live stock men about the ringside were: Professor J. I. Thompson, University Farm, Davis; Chas. L. Hughes, manager of the California Breeders' Sales and Pedigree Company, Sacramento; J. J. Doty, publisher of the Duroc Bulletin, Chicago, and C. R. Thomas, manager of the Los Angeles Live Stock Show. At the opening of the sale J. K. Macomber, president of the Tulare County Livestock Breeders' Association, introduced M. C. Zumwalt of the Tulare Board of Trade, who told of the results obtained by close cooperation between the breeders, farmers, merchants and bankers of Tulare. J. J. Doty discussed the modern Duroc-Jersey type. Chas. L. Hughes gave a very concise review of the rapid development of all kinds of pure bred live stock in this state and discussed the relative values of a few years ago and those of today. Professor J. I. Thompson told of the recent results of feeding tests of grades, crosses and pure bred hogs.

Col. George W. Bell served as auctioneer and displayed unusual ability on the block.

The complete sale report follows:

Consignment of Henry Cummins, Visalia
1. F. D. Burr, San Francisco, $130.
2. Allen Thompson, Visalia, $100.

57. C. P. Morgan, Shafter, $110.
58. W. L. Caldwell, $95.

Consigned by Tagus Ranch, Tulare
Extra. Mrs. W. L. Fisher, $75.

PROMPT CUTTING MEANS MORE ALFALFA

Experiments conducted at the Nebraska agricultural experiment station indicate that alfalfa produces more if attention is given to the proper time of cutting. Tests were made for total yields per season when alfalfa was cut two, three, four and five times. It was found that three or four cuttings, depending on the season, gave the largest yield for that section of the state in which the experiment station is located. "Forage Crops," Experiment Station bulletin 169, says there are two indexes for the proper harvesting time. They are the appearance of the first bloom and the starting of a new growth at the crown and lower part of the old stem. Cutting should begin at the appearance of either index. Experiments also show that getting hay into the stack or barn at the proper time means a saving of more leaves, which form 50 per cent of the value of the hay. In good drying weather a half day or less in the swath and a day in the windrow will ordinarily do. Rain or dew is more likely to cause mold in the stack than the moisture in the plant. It is often better to stack a little green and let the hay brown cure than to have it rained on or lose too many leaves.

IT'S A GAY OLD WORLD

It's a gay old world when you're gay
And a glad old world when you're glad,
But whether you play
Or go toiling away
It's a sad old world when you're sad.

It's a grand old world if you're great
And a mean old world if you're small;
It's a world full of hate
For the foolish to prate
Of the uselessness of it all.

It's a beautiful world to see
Or it's dismal in every zone.
The thing it must be
In its gloom or its glee
Depends on yourself alone.
—National Magazine.

"How sweet to think, whate'er the day,
Howe'er we go or come,
Or slow or fast hours slip away,
The nightfall brings all home."
—Mrs. M. E. C. Bates.

THE BEST LINIMENT
OR PAIN KILLER FOR THE HUMAN BODY
Gombault's
Caustic Balsam
IT HAS NO EQUAL

For the Human Body — It is penetrating, soothing and healing, and for all Old Sores, Bruises, or Wounds, Felons, Boils, Corns and Bunions. CAUSTIC BALSAM has no equal as a Liniment.

Questions and Answers

ANSWERS BY EDITOR AND STAFF

Questions to be answered in this department should be received at the office one week before reply is expected. Write plainly on one side of the paper and sign full name and address. Unsigned communications receive no attention.

Slobbering Horse

Can you inform us of a remedy for a bad slobbering horse? He slobbers continually and there seems to be nothing wrong as far as we can tell. He has just recently had his teeth well fixed and otherwise he is perfectly normal, although getting somewhat thin. His manger and stall are constantly wet from the excessive secretion.—Subscriber, Santa Barbara

From "Diseases of the Horse," issued by the department of agriculture we note on page 45: "This is often seen as a symptom of irregular teeth; inflammation of the mouth or tongue, or of the use of such medicines as lobelia, mercury, and many others. Some foods produce this, such as clover, and particularly second crop; foreign bodies, such as nails, wheat chaff, and corncobs becoming lodged in the mouth. If the cause is removed no further attention is necessary, as a rule. Astringent washes may be applied to the mouth as a gargle or by means of a sponge."

From "The Farmer's Veterinarian" by Burkett: "Some kinds of food cause an unnatural flow of saliva. Fresh crimson clover hay is one of these. Of course the continual flow is undesirable and unpleasant. It is unnatural and should be checked as soon as possible. This can be accomplished by changing the feed and then washing the mouth out with alum water. If a change is not observod soon, give a good physic. For horses use eight teaspoons of bitter aloes, a teaspoon of common soda and a teaspoon of ginger. Mix these in a pint of water and give as a drench. For cattle dissolve a pound of Epsom salts, a tablespoon of common soda and a tablespoon of ginger in a quart of lukewarm water and give as a drench.

Kangaroo Rats

Is there any way of ridding land of kangaroo rats? Some of our land is badly infested with them. They do the most harm at bean planting time as they eat the planted beans before they germinate. In some places they are so bad that beans had to be planted three times. As the runways of the rats are very small and the land soft the setting of traps as well as the laying of poison in the runways is impossible as the land falls in as quick as you open the runways.—Subscriber, Arroyo Grande.

Our experience with kangaroo rats has been as pets, therefore we can only give general suggestions and at the same time ask subscribers who have had experience in controlling them when they become a pest. The first suggestion we would make is to write State Horticultural Commission, Forum Building, Sacramento, and ask for the California Ground Squirrel Edition of the Monthly Bulletin, Vol 7, Nos. 11 and 12. While this is principally devoted to ground squirrels and the method of control, there is a short chapter, or rather appendix, touching upon destruction of pocket gophers, mice, jack rabbits, rats, etc. While waiting for this book to come get busy with carbon bisulphide, Klimol, burning sulphur, smoke, or other poisonous gases and fill their runways so full that many will be destroyed. We recently saw the operation of a machine intended to dust sulphur on vines and trees but which had an attachment which might be lighted and as the sulphur is blown through the machine it burns and the fumes are forced into gopher holes, or squirrel burrows. Such a machine as this, as well as the ordinary bisulphide of carbon fumigating, will destroy thousands of the rodents.

Potao Scab

Would you kindly tell me the cause and remedy for scabby potatoes?—Subscriber, Buena Park.

The cause of the scab is a fungus or rather a bacterium, Actinomyces chromogenus. There is no remedy for the crop now growing and infested, but by planting in disease free soil, clean seed which has been dipped, one may have a crop entirely free from the pest One should refrain from applying lime, manure, etc. to the ground while the potatoes are growing. The dip usually used is: Formaldehyde, 40 per cent solution, one gallon; water, two ounces. Immerse potatoes one hour before cutting.

Fertilizer

What is the best fertilizer and the best method of collecting, rotting, and applying barnyard manure?—Subscriber, Buena Park.

There is no best manure, for the fertilizer and manure question is dependent upon so many things as to crop, condition of soil, rainfall, etc. that an article which is the best in one case may not be best in another. However, we may say that stable manure from grain fed animals is generally considered the most desirable. As to commercial fertilizer the question is too big and there is too much diversity of opinion, for some believe the "simples" such as mineral nitrates or blood or tankage for nitrogen, bone or rock phosphate for phosphorus, or sulphate or muriate for potassium, are best while others believe complete mixed commercial fertilizers are best. Unless one understands the situation more than most of us do it is perhaps best to apply the complete fertilizer although many maintain that California soils are sufficiently rich in potash that such a high priced product need not be applied. Also another general statement: There is little danger of ever getting too much vegetable matter in our California soils. Do not compost manure but apply as rapidly as made and if possible work in as made.

Poultry Diseases

Where can one get literature on the diseases of poultry?—Subscriber, Fresno.

Mrs. Koethen's book, "Poultry for Profit" gives several pages to diseases and treatment and at the same time puts greatest emphasis on the first paragraph of the chapter on sanitation and prevention. However, we are all rather too lax, and conditions which permit disease are allowed to prevail at times. For such the experiment station, University of California, Berkeley, has published, and will send for the asking, Circular 150, "Roundworms in Poultry"; Circular 162, "White Diarrhoea"; and Bulletin 156, "Fowl Cholera". From the secretary of the Department of Agriculture, Washington, D. C., one may secure Circulars 170, "The Fowl Tick", of the bureau of entomology, by F. C. Bishopp; Farmers Bulletin 801, "Mites and Lice on Poultry"; Bulletin No. 8, "Investigations concerning Infectious Diseases Among Poultry", by D. E. Salmon of the bureau of animal industry; Bulletin No. 12 of the Bureau of Animal Industry, "Tapeworms of Poultry", by Salmon. It is possible the department has other publications on poultry diseases. The Agricultural Experiment Station, Orono, Maine, has issued a very complete bulletiu, "Poultry Diseases and Their Treatment". We are not certain whether this would be mailed to residents of states other than Maine, but presume that if postage were sent to cover it probably would be mailed.

Flies on Lemon Blossoms

Three years ago we set out two lemon trees that were then two years old. They have grown and look well, but we never have any lemons. There is a fly that gets on the blossoms and the blossoms fall off. Do you think the fly is the cause?—Subscriber, Palms.

These flies are not the cause of the short crop. Their exact name cannot be given, but enough is left of the specimens sent in the letter to show that they are one of a large family of small beneficial insects which are usually present in large numbers where there is aphis infestation on tips of the trees. So our guess is that these flies indicate that your trees were infested with plant lice, or aphis. They should have been sprayed with tobacco extract or weak kerosene emulsion. Watch for the little green bugs on the tips of the branches and if present give them quick attention.

Tree Protectors

For young citrus trees which is the better plan, to whitewash or to use tree protectors?—Subscriber, Los Angeles.

We would prefer the yucca protectors for they afford better protection from sun, and in addition afford perfect protection from rodents or other pests.

Pruning Young Citrus Trees

In pruning young citrus trees is the better plan to cut off all but three or four main branches and then permit just two on each of those? On young trees how can you tell sucker wood from fruit wood?—Subscriber, Los Angeles.

Instead of allowing all the branches to grow at will and ripen their wood we would prefer to have the growth controlled by thumb pruning, that is, pinch the young tender tips of all excepting the three or four which are to be preserved. These should be carefully selected according to their distribution around the main trunk so as to balance the tree. The others pinch back week by week as suggested above so as to control and subdue, still allowing leaves to remain and encourage most thrifty growth. Then at the end of the first year more may be entirely removed as may seem best. The same plan to be followed with the small branches which will come out on each of these foundation branches. A sucker may be considered the strong, vigorous growing branch or shoot which may be coming out near the ground and grow so vigorously that it in time subdues the main trunk of the tree and ultimately the entire tree. The best way to deal with these suckers, provlding the selected trunk of the tree is vigorous in growth and has not been injured, is to suppress by continual pinching back of the young growth, or it may be removed entirely Again, some growers call suckers any strong growing branches which come from the top of the tree. These may be controlled by the same method of pinching back. If allowed to grow without control they soon make another top of the tree. Wood bearing branches, on the other hand, instead of throwing out one or possibly more strong shoots which grow directly upward, are the horizontal branches, yet vigorous enough that they will send out a large number of blossom twigs next spring. The present day method of pruning, especially with lemon trees, calls for suppressing this strong upright growth and forcing the sap into these smaller fruit bearing twigs.

LOS ANGELES DEMONSTRATION

Manager O'Neil of the Traction Engine and Implement Dealers' Association reports Los Angeles lining up for a great demonstration this fall, presumably some time in September. The association has secured through the courtesy of George A. Hancock a portion of the La Brea Ranch at the corner of Melrose and Crescent Avenues just west of the city. This is not far from the demonstration grounds of last year but affords better conditions. The site is just east of Mercury Aviation Field, formerly De Mille Field.

Tannin is all right for tanning leather, but nobody wants it in tea.

The way to get tea-flavor without tannin is to buy a fine tea and then not boil it—steep it just long enough to get the tea-flavor.

Get Schilling Tea and make it this way, and you have a fine rich invigorating drink at the very low cost of ⅓ cent a cup.

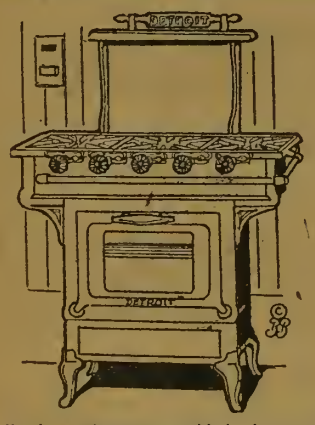
There are four flavors of Schilling Tea—Japan, Ceylon - India, Oolong, English Breakfast. All one quality. In parchmyn-lined moisture-proof packages. At grocers everywhere.

A Schilling & Co San Francisco

Detroit Vapor Stoves

Work Like Gas

Burn Oil, Gasoline or Distillate



Here's a stove you ought to know more about. It makes friends on sight and keepe the housewife good-natured and happy, because it always does the right thing at the right time—and is such a splendid baker besides.

DETROIT VAPOR STOVES are made in several styles and sizes, and burn kerosene, gasoline or distillate. They eave practically one-fourth of the fuel required by other liquid fuel stoves. Simple to operate and cheapest to buy when you consider eervice and durability. Write for illustrated, descriptive circulars and prieee.

THE LANDLORD

The landlord used to come around
As regular as a clock.
Upon the door we'd hear him pound—
Oh, 'twas a glad and joyful sound
To hear that landlord knock!

He knocked upon the entry-way,
He knocked upon the door;
He came around the first of May
And saw the puppies at their play,
And then he knocked some more.

That landlord used to hand us knocks
Because we had a cat,
A bird, a rabbit in a box,
And half a hundred Plymouth Rocks—
What think you, now, of that?

But when he acted meanest yet
Was over Gwendolen;
When she was born, the littie pet,
He growled and said, "You mustn't let
This thing occur again."

We have another landlord now
And he is different.
We've bought a parrot and a cow—
He doesn't holler, anyhow,
Or press us for the rent.

Now Gwendolen has sisters four
And she has brothers two;
They pound the walls and pound the floor,
And still this landlord doesn't roar
Like that one used to do.

We've put that landlord mean to rout,
And I will tell you how:
We have a cottage farther out,
With vines and roses 'round about,
And I'm the landlord now.

METHODS OF WORK

OUR article in last week's Cultivator dealt almost entirely with equipment for making housework more business like. This week we give best methods of cleaning floors, woodwork, walls, windows, metal surfaces, etc., as described by Ruth McNary Smith of the Oregon agricultural college.

It is important that the housewife should not only have the proper tools to work with and a practical working plan, but also the best methods of doing her work. The following suggestions are made for the average housekeeper who does the work herself with the cooperation of the members of her family.

Care of Floors

Floors should be made of well-seasoned, well-laid two-inch boards, which give better wear although they cost slightly more. The grain of wood floors should be straight because boards with straight grain are less likely to splinter.

Short lengths are undesirable and should not be accepted. Hard wood floors wear better, look better, and are more easily cared for than soft wood but the cost is high in some localities. However, the living-room floor should be maple or oak, if possible.

An easily cared for finish on pine or fir is one coat of light brown stain and two coats of orange shellac, after the cracks have been filled with a preparation for that purpose. Applying shellac once a year, or twice a year in front of the doors, will keep such a floor in good condition. The best way of removing the daily accumulation of dust and lint from such floors is by means of an oiled mop. Floors should not be painted except as a last resort. A painted floor may also be dusted with a mop and washed occasionally with lukewarm water containing a little kerosene. A finish for a hardwood floor requiring but little care and wearing well is one made by filling, shellacing and rubbing down. The waxed floor requires constant polishing with weighted brush and frequent rewaxing and is not practical in the average home unless a man can do the necessary polishing.

Woodwork

The woodwork should be as plain and free from grooves as possible. Stained woodwork in gray or similar tones is attractivo but unless shellaced or varnished over is absorbent and not durable.

The ordinary shellaced woodwork may be cleaned occasionally by going over it with a cloth dipped in tepid water containing one tablespoon kerosene to about a pint; it should be dried immediately with dry cloths. Painted woodwork may be washed occasionally with a good white soap, such as Ivory, followed by thorough rinsing and drying. Whiting applied on a damp cloth will usually remove spots and finger prints.

Furniture

Nothing saves time and labor like plain, dull finished furniture of substantial design. General dusting should be done with a black cheesecloth duster prepared in the following manner. Dip the cloth into hot water, wring dry, then put into boiled linseed oil which has been thinned with one-third its volume of turpentine. Wring out the duster and hang outdoors until perfectly dry. It may be washed and retreated. Cedar oil may be substituted for the linseed, but not being a drying oil it is apt to be more greasy.

Furniture polishes should be avoided as most varieties contain cheap shellac which only covers scratches temporarily and leaves the wood in worse condition than before. If not completely removed, any oily restorative when applied to wood will collect dust and form a dark, sticky spot. This sticky surface may be removed with turpentine. Oils, in general, with the exception of paraffin and poppy seed oil, tend also to darken wood. Scratches may be concealed by applying on a cloth a small amount of water color for wood, to match the finish of the furniture.

White spots due to heat or water are easily removed by applying an oil of some kind such as linseed or sweet oil. The oil is then allowed to stand for an hour or so; it is rubbed vigorously and the treatment repeated until the varnish becomes clear once more. Care must be taken to remove every trace of oil. Sal soda and kerosene may be used for very bad spots; the soda is sprinkled on and rubbed with a cloth dipped in kerosene. Dullness due to long usage may be improved by treatment with a mixturc of two parts boiled linseed oil and one of turpentine. The oil is rubbed off completely with a woolen cloth. This treatment may be followed by applying a good polishing wax in a very thin film, allowing it to stand an hour or more, and rubbing the surface vigorously with a woolen cloth and finishing with a polishing buffer. A suitable buffer is made by covering a brick with several layers of padding, over which a woolen cloth is fastened securely.

Washing furniture occasionally with lukewarm water and kerosene, drying immediately, is also helpful in removing the greasy film likely to appear on it.

Cleaning and Polishing Metals

The same kind of polish is not suitable for all metals. Metal utensils are either solid or plated and some are lacquered to prevent darkening. Different methods of treatment are necessary to suit these different kinds of metals. If lacquered avoid polishing.

Silver, Solid. 1. Put into a bright tin or aluminum pan and boil until oxide disappears. The addition of one tablespoon of soda and one tablespoon of salt helps this action.

2. Polish with whiting or silicon and ammonia, or lard, for a satiny finish.

Plated. 1. Use method No. 2 under solid silver.

Steel Ware. 1. Polish by rubbing a cork into powdered bathbrick and then over the moistened steel. Rinse and dry thoroughly.

Brass and Copper. 1. Remove bad tarnish with vinegar and salt, working quickly and rinsing off thoroughly. (Avoid if plated.)

Polish with a paste made by mixing rottenstone with olive oil, sweet oil or linseed. Wash, rinse and polish off with a flannel cloth or chamois.

Nickel. 1. Boil in vinegar or alum mixture—two ounces powdered alum, one quart vinegar.

2. Polish with whiting and ammonia or lard and whiting.

Zinc. 1. Clean with kerosene.

Aluminum. 1. Fill utensil with water containing a little vinogar, boil five minutes or more. Wash thoroughly and dry. The addition of one-half teaspoon of vinegar to tho contents of an aluminum vessel will prevent the darkening due to the action of alkalis.

2. Polish outside with whiting and ammonia or alcohol.

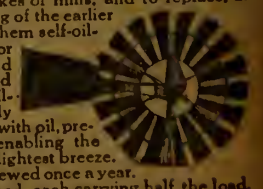
Adams Pipe Works
Bay and Mateo Sts. Los Angeles, Cal.

THE SELF-OILING WINDMILL

has become so popular in its first four years that thousands have been called for to replace, on their old towers, other makes of mills, and to replace, at small cost, the gearing of the earlier Aermotors, making them self-oiling. Its enclosed motor keeps in the oil and keeps out dust and rain. The Splash Oiling System constnatly floods every bearing with oil, preventing wear and enabling the mill to pump in the lightest breeze. The oil supply is renewed once a year. Double Gears are used, each carrying half the load.



We make Gasoline Engines, Pumps, Tanks, Water Supply Goods and Steel Frame Saws.
Write AERMOTOR CO., 2500 Twelfth St., Chicago

Washing Windows

Remove paint and stains with turpentine.

For badly soiled windows prepare a thin mixture of whiting and ammonia. Apply with a cloth over surface. Let dry, rub off with clean cloths. Polish with chamois skin, with newspapers, or orange wrappers.

Put one tablespoon of ammonia into a pan of warm water. Wash windows, drying and polishing. Chamois skin is most satisfactory to finish with.

Cleaning Enameled Plumbing Fixtures

Avoid coarse scouring materials as the glaze is injured and staining occurs more readily.

Wash with hot soapy water, using kerosene to remove black marks and dilute hydrochloric acid for iron stains.

Clean occasionally with the following mixture and a brush, rinsing out thoroughly afterwards: One-half cup chloride of lime, one-half cup whiting, one cup sal soda.

Powder fine and sift or mix thoroughly and put in a glass-topped jar. Sprinkle a little into sink or tub.

Avoid the use of lye in sinks or tubs for cleaning pipes. This forms an insoluble soap plug and results in plumber bills. Sal soda and plenty of hot water should be substituted.

Plaster and Wall Paper

A long handled wall brush covered with lambs wool is useful in keeping walls free from dust but a broom covered with a sack or cloth is a good substitute.

Grease spots may be removed by covering them with warm talcum powder until absorbed.

Linoleum

Inlaid linoleum wears better and is more economical in the end than the painted variety. It is more easily cleaned if laid with a sanitary base as follows:

In measuring floors for linoleum allow two inches extra on all sides.

Fasten the edge two inches above the floor by means of a narrow flat molding, all around the room so that the linoleum joins the wall in a curve instead of a right angle. Linoleum should be shellaced at least once a year to lessen wear. Wash with lukewarm water containing a little kerosene, avoiding soap powders, yellow soaps or hot water.

The addition of a little milk to the rinsing water tends to prevent cracking.

MY FRIENDS THE HUMMINGBIRDS

I first saw my little California hummingbird before my window, running her bill into one clematis flower after another. Finding nothing, she darted off; but was soon back. Evidently she was finding little to eat, so I mixed some honey and water together, and filled the blossoms. Presently she returned, and, half-heartedly, tried a flower. At the first taste, the whir of her wings quickened, and, with an air of pleased surprise, she cleaned up every drop. Two or three other hummers discovered the new lunchroom that afternoon, and it met with instant approval.

I had always supposed that hummingbirds were timid, but three days after the first meal, one, growing impatient, came down while I was filling the flowers, and began to eat. Afterwards she hovered around my head a minute. Another time she sat down on the vine about a foot from me, and inspected me at her leisure. Later I read in a bulletin of the California Fish and Game Commission that the hummingbird was "quite courageous, and seems to have little fear of man. It has even been known to light on flowers held in the hand."

They were curious as well. If I started to pull weeds, or sat down on the porch, they sailed down to see what I was doing, and one day I noticed a very interested hummer sitting on the vine at the window, and craning his neck to watch me.

They soon decided that I was the source of supplies. If they found the flowers empty, they would sit on the wire fence or in the pepper trees until I came. Finally they learned to hunt me up. I would see a hummer hovering before a window; then, when it had attracted my attention, it would dart away to the clematis vine.

They soon learned to eat out of a flower held in my hand. One day, about a month after our acquaintance began, I held my finger in front of the flower, and slowly raised it until it touched the hummer's body. To my breathless wonder, she straightened out her legs, and finished her luncheon perched on my finger.

I learned to recognize only three of them apart. One, which came only a few times, had a fawn colored back, and was, probably, a rufous hummingbird. The other two were of the Anna variety. Their heads and backs were green, and they were gray underneath. The larger hummer learned to perch on my finger also, but he was never as trusting as the smaller one. She would fly up, and examine my face, sit down and scratch her head (she could also perform this feat in the air) pretend to fall off my finger, adjusting herself with much fluttering, eat out of a teaspoon, and run her tongue out at me. I do not think she meant this impolitely, but as a delicate mark of appreciation.

What puzzled me, however, was where she kept that appalling length of tongue. Her bill was about three-quarters of an inch long, and she could run her tongue out fully as far again I have since read that there is a small cavity at the back of the bill in which the tongue coils up like a watch-spring

The male would drive the female away if he found her at the flowers. One day, after chasing her out of sight, he took his station on a vine over the porch, now and then gazing fiercely into the sky for more hummers to conquer. Meanwhile, the female came around from the other direction, and took the last drop of honey.

Sometimes she would refuse to be driven away. Then the male would fly at her again and again, like a vicious little pendulum. He never succeeded in hitting her, but, if he had, there would have been an explosion of small feathers.

One day, after driving her off, he came to the window where I was, and, hovering in the air, sang a song of victory. It was a sweet song of five or six notes, and he repeated it two or three times. I had never known before that the hummingbirds sang, although they had often chirped when there was no honey waiting for them. When angry, they make a chattering sound, and when they fight, they give a tiny shriek.

The last I saw of my hummers that year was near the end of August. The female disappeared first. A few days after I saw the male at the window. I opened it, but, instead of coming down for the honey, he hovered in the air, looked at me for a second or two, and then flew away.—Our Dumb Animals.

AUNT MARY HAD THE IDEA

Aunt Mary Wells is one of the few "befo' de wah" darkies left in a little Kentucky town. Recently she was discussing with her employer the merry-go-round that was running up on the corner.

"Nawsuh, Mr. Malcolm," she said, "nawsuh, I don' ride on none o' dem things. Why, Mr. Malcolm, I've seen some o' these fool niggers git on that thing and ride as much as a dollar's worth, an' git off at the very same place they gits on at; an' I sez to 'em, 'Now you spent yo' money, nigger, whah yo' been'?"—H. I. C.

THE DIFFERENCE

"Why is it, Sam, that one never hears of a darky committing suicide?" inquired a Northern man.

"Well, you see, it's disaway, boss," answered the negro. "When a white pusson has any trouble he sets down an' gits to studyin' 'bout it an' a-worryin'. Then firs' thing you know he's done killed hisse'f. But when a nigger sets down to think about his troubles, why, he jes' nacherly goes to sleep!"

Cut out the fault finding, be sparing of adverse criticism, and be more generous of deserved praise and appreciation. The good traits developed under this system usually crowd out the annoying or bad.

DRIED FRUITS

The California Prune and Apricot Growers, Inc., the growers' cooperative nonprofit organization composed of 7000 farmers controlling 75 per cent of the prune acreage of the state, announced prices at San Jose Tuesday which will be paid its members for their 1919 crop.

The growers will be paid a bulk basis price of 13.56 cents per pound. According to the percentage of sizes in a normal crop this means that the growers will average a little more than 14 cents a pound or $284 a ton for their fruit. The base price announced according to sizes are 20-30s, 22 cents flat, 30-40s 16 cents, 40-50s 14 cents, 50-60s 12 cents, 60-70s 11½ cents, 70-80s 11 cents, 80-90s 11 cents, and 90-100s 11 cents. One cent a pound premium will be paid for fruit delivered before September 20. On small sized fruit 8½ cents a pound will be paid for 100-120s and 7½ cents for 120s and smaller.

On the basis of prices named by their association the prune growers of the state who have stood by the organization will collect more than $25,000,000 on the largest crop which has ever been produced by the California farmers. It is estimated that the association will market 180,000,000 pounds of prunes for its members.

It was announced in naming prices yesterday that hundreds of orders for stocks from the 1919 pack had been turned down in the last few weeks by the growers' organization because it had already made as many sales as it dared until a more accurate estimate can be made of the size of the yield this fall.

Growers who gambled on beating the association by selling to independent packers, who, in waging a bitter fight against the cooperative organization have been trying for months to buy up crops before the association named its prices, have lost and in rare cases stand to lose almost $100 a ton on their fruit in comparison with the amount the association members will receive.

Peach prices for the 1919 crop were announced at Fresno, July 16, by the California Peach Growers Inc. The price list agreed upon by the directors and announced by General Salesmanager Sturtevant, follows:

Effective this date and until further notice, our prices f. o. b. our California factories, on 1019 crop dried peaches for the domestic and foreign trade: September, October, November shipment, sellers' option: guaranteed against our own decline until January 1, 1920, are as follows:

Standard yellows, 14¾; Muirs, 15.

Choice yellows, 15¼; Muirs, 15½.

TiziT TiziT

Cost of Fruit Loss vs. Cost of Tizit

The loss to the grower of degraded or smutty fruit is many times the cost of spraying with Tizit Spray.

Any method that leaves smut and dead scale or scale not killed cannot be said to be perfect. Tizit Spray cleans off dead scale, moss and lichen that retard the growth of the tree and hinder the development of the fruit.

It is an investment and not an expense, as we can prove to you by the experience of many growers who find that they have more fruit and that it grades better.

You will be surprised at the results and what can be accomplished at so small a cost. Remember Tizit is not an oil base spray. It is positively harmless to tree and soil. Navels sprayed with it every year for the past five years have borne fruit that passed the 8 to 1 test several weeks ahead of groves adjoining. One Black scale will produce 2000 to 3000 young. Think of the condition your grove will be in if you delay treatment until the weather is cool enough for fumigation. Tizit costs less than half and works all season.

It is the most efficient Black Scale and Citricola Scale eradicator that can be used at a price that is ridiculously small compared with the results obtained.

Let us send you the names of grove owners who have been using Tizit Spray during the past five years so you can compare what Tizit has accomplished with every other method and the C O S T.

Tizit Spray Mfg. Co.

1344 Willow St. Phone 12089 Los Angeles

Also may be ordered through our local agents, or

Fancy yellows, 16½. Mulrs, 17½.
Extra fancy yellows, 17¾; Mulrs, 18¾.
Slabs yellows, 14½.
For "practically peeled" add 1½ cents per pound (any grade).
Prices above are all bulk basis.
For packing in: 50-pound or 25 kilos boxes add 1 cent per pound.
25-pound or 12½ kilos boxes, add 1¼ cents per pound.
10-pound boxes, add 2 cents per pound.
Blue ribbon peaches packed five-pound cartons, 12 per case, 12.00 per case.
Blue ribbon peaches packed two-pound cartons, 24 per case, 10.00 per case.
Bakers' special, "practically peeled," 16¾ per pound, bulk basis.
Figs: Wh. stand., 16; ch., 18½; ex. ch., 20; fy., 22½.
Apples: Ch. (in 50's), 21; ex. ch., (in 50's), 21½; fy., (In 50's), 23.
Pears: 1919 crop, stand., 20; ch., 22½; ex. ch., 23½; fy., 26.

BEANS

Demand and movement moderate, market steady. Carloads f. o. b. usual terms —valley and common rate points—small whites, sacked mostly 6.50; Black Eye, 4.75.

GRAIN AND FEEDS

Oats: Red feed, 2.20@2.40 per cental.
Corn: California yellow, 3.15@3.40 per cental. Egyptian, 2.75@3.25; Milo maize, 2.50@3.00.
Rye: 3.65@3.75.
Wheat: Following are net weight prices for bulk grain, based on federal standards and grades at San Francisco Bay and Los Angeles terminals:

Hard Wheat—	Per Bushel	Per Cental
No. 1	2.20	3.66 1-3
No. 2	2.17	3.61 2-3
No. 3	2.13	3.55
Soft White—		
No. 1	2.18	3.63 1-3
No. 2	2.15	3.58 1-3
No. 3	2.11	3.51 2-3
Club and Sonora—		
No. 1	2.16	3.60
No. 2	2.13	3.55
No. 3	2.00	3.48 1-3

For sacked grain add nine cents per bushel of 60 pounds to above price. Deduction of three-fourths of a pound is made for weight of standard grain bags. Wheat grading under No. 3 and mixed or smutty wheat will be purchased according to merit.
Mill Feed (per ton): Bran 43.00@44.00; mill run, 42.00@43.00; Rolled barley, 52.00 @54.00. Linseed oil cake meal, nominal; cocoanut cake or meal, 41.00@42.00 per ton.

HAY

Under date of July 19, Scott, Magner & Miller says:
Receipts past week 183 tons. A large part of these receipts arrived by water. It looks now as if there would be a decided shortage of rail equipment. Demand for hay has been fair and receipts have been moved without difficulty. Choice quality red oat and wheat have met with good demand. The country demand has been fairly active and considerable hay has moved in this direction. There has been very little demand for export, and with the exception of a call from the government for about 1500 tons of hay and alfalfa there has been nothing particularly interesting. Some sales of round lots have been reported as having been made in the country during the week; especially is this so as regards alfalfa, which market has taken on considerable strength and is quoted higher.
We quote today wholesale prices in carload lots for old hay as appear from dealers' transfers upon the hay market—for prices to consumers charges of cartage, commission and handling expenses must be added according to conditions:

Fancy Wheat hay (light 5 wire bales)	17.50@18.00
No. 1 Wheat or Wheat and Oat hay	15.00@17.00
No. 2 Wheat or Wheat and Oat hay	12.00@14.00
Choice Tame Oat hay	15.00@17.00
Other Tame Oat hay	12.00@14.00
Wild Oat Hay	10.00@13.00
Barley hay	12.00@15.00
Alfalfa hay	14.00@18.00
Stock hay	9.00@11.00
No. 1 Barley straw, bale	.50@ .80

Citrus Markets

Los Angeles, July 23, 1919.

Valencias are looking up a bit though conditions have been unsatisfactory for some time. There are still nearly 8000 cars to go forward. Shipments are approaching 100 cars daily.

As to next season's crop there is much diversity of opinion but guesses range usually around 60 to 75 per cent for navels, while Valencias will run not far from 75 per cent.

Lemons are selling well, though some low grade stock has sold at little more than cost of transportation.

Shipments

Shipments of oranges from Southern California to date since November 1, 1918: 28,052 cars; lemons, 8060; total, 36,112. To same date last season: oranges, 12,-188; lemons, 4347; total, 16,535. From Central California to date this season: oranges, 4427; lemons, 354; total, 4783. Last season same date: oranges, 2539; lemons, 115; total, 2654. From Northern California to date: oranges, 244; lemons, 2; total, 246. Last year: oranges, 203.

AT THE AUCTIONS

July 17

New York: 18 or., 2 lem. Poor stock selling low. Val. $1.40-6.10; grapefruit, $5.25; lem., $1.50-4.20.
Philadelphia: 6 or., 6 lem. Val. $2.80-5.25; lem., $1.20-4.05.
Boston: 8 or., 6 lem. Lower. Val. $2.40-4.65; lem., $1.75-4.45.

July 16

New York: 25 or., 2 lem. Val. $2.95-5.10; grapefruit, $2.30-5.00; lem., $1.05-3.75.
St. Louis: 5 or., 5 lem. Val. $3.35-5.10; lem., $3.15-5.75.
Pittsburg: 7 or., 4 lem. Val. $3.40-6.05; lem., $2.05-4.60.
Boston: Lower on lem. Val. $3.05-5.70; lem., $1.00-5.35.
Philadelphia: Slightly improved condition. Val. $3.50-5.10; lem., $1.35-3.90.

July 18

New York: 10 Val., 1 lem. Val. $2.20-6.10.
St. Louis: 3 or., 7 lem. Val. $3.40-4.75; lem., $1.85-5.45.
Cleveland: 2 or., 3 lem. Val. $4.00-5.85; lem., $2.70-4.50.
Cincinnatia: 4 lem., $2.10-4.85.
Pittsburg: 3 or., 2 lem. Val., $3.55-5.00; lem., $1.70-5.00.
Boston: 3 or., 4 lem. Val. $2.60-4.40.

July 21

New York: 20 or., 1 lem. Val. $1.80-7.55; grapefruit, $3.10; lem., $3.00-4.70.
Pittsburg: 7 or., 4 lem. Val. $.50-5.20; lem., $2.65-5.30.
St. Louis: 3 or., 6 lem. Val. $3.50-4.55; lem., $1.75-6.05.
Cleveland: 1 or., 4 lem. Val. $2.15-6.40; lem., $3.00-4.30.
Boston: 6 or., 7 lem. Val. $2.90-5.00; lem., $1.25-3.50.

MARKET NOTES

Arizona cantaloupe growers had shipments curtailed by car shortage caused by wrecked bridge.
It is estimated by the U. S. crop bureau that Arizona's cantaloupe shipments will double those of last year.

A large proportion of the cantaloupes grown in the Los Angeles district are consumed locally, but this year there will be a few hundred cars for shipping out of the district. Unusually heavy plantings were made this season and they are practically all coming on well.
San Fernando Valley and Glendale in Los Angeles County have big acreage planted to cantaloupes.

The Turlock melon district complains of heavier disease infection than usual. The season as a whole has not been favorable. Heavy shipments will be late.
Potatoes generally are not of as good quality as usual. Poor seed is given as the cause.
Fusarium wilt is very prevalent in potato fields.
San Fernando district will ship about 225 carloads of potatoes.
Watermelon shipments from Imperial Valley have been heavy this year. Crop has been about twice as large as last year. Los Angeles County also will have a big increase in production over last year.
Sweet potato shipment from Imperial and Coachella Valley has closed. May and June shipments amounted to 112 cars this year, 88 cars last year. The new district, Irvine Ranch, Orange County, has started shipments with good prospects.
An investigation made last year showed that seven per cent of the acreage of corn in California was cut green for ensilage and 14 per cent was cut for green feed, leaving only 79 per cent harvested for grain. Federal crop reports show a slight increase in acreage planted in this state, with a forecast of 2,500,000 bushels.
In some parts of the state there have been a few days of desiccating north winds which did some damage to all field crops especially cereals. "It is worthy of note in this connection," says J. E. Rickards, field agent, "that the supply of water for irrigation purposes is getting alarmingly low in some parts of the San Joaquin Valley. These two unfavorable factors are reflected in the condition figures of all crops, and unfortunately at this time of the year there can not be any improvement.

Though there has been an increase in acreage planted to potatoes in the Delta region, the state as a whole shows a slight falling off—91,000 acres as compared with 93,000 last year. The production, based on a condition of 88, warrants the forecast of 12,252,240 bushels.

California's acreage of sweet potatoes is practically the same as a year ago, with a forecast of production of 968,000 bushels for California.
There have been sown this year in California about 140,000 acres of rice as compared with 108,000 acres last year. Although the general condition of the crop is favorable the fear is expressed that the late sown rice may not mature unless the season is unusually favorable. Based on the present condition of 94, our forecast of total production is 8,685,600 bushels.
The north winds in June, following the lack of spring rains, reduced prospects for wheat since early spring. The federal forecast is 13,916,610 bushels for California. The forecast of production for the United States is 1,000,000,000.
Last year's average weight of wool per fleece was seven pounds. This year it is increased to 7.4 pounds.
Alfalfa in many sections is showing loss of condition through lack of water.
All vegetable crops, except on irrigated land, are suffering for want of water.
Good prices for hops at the close of the season last year have induced planting a larger acreage than was picked last year.
Fruit crops are holding up, away above the ten year normal average. Prunes top the list, showing condition on July 1 of 131.6 per cent.
The weather has been a trifle cool for drying apricots in some places, but this weather has insured a regular ripening.
More than half of California's peach crop is grown in the San Joaquin Valley where nearly every county has better than a full crop.

DR. MEAD ON BANK COMMITTEE

Dr. Elwood Mead, professor of rural institutions in the University of California, and chairman of the land settlement board of the state of California, has been appointed a member of a committee of which Edward A. Filene of Boston, director of the United States Chamber of Commerce is president, formed in New York to draft measures providing for bank credits on short time for farmers and industrial workers.

DATES AT INDIO

Under date of June 11 a letter from Indio, Riverside County, says: "Individual clusters of Deglet Noors in the government date orchard have already attained an estimated weight of 40 to 50 pounds, and in numerous instances this weight will in all likelihood be exceeded at maturity."

PATTERSON FAIR

Patterson, Stanislaus County, has organized a fair association and has chosen August 22-23 for its first annual

The Almond Growers' Exchange is putting bleaching machinery in its plant at Lodi. Other improvements are being made at a cost of $12,000.

The crop of Elberta peaches in Texas is now moving to market. It is estimated at 1800 carloads.

WEATHER REPORT

San Francisco, California, July 19, 1919.

THIS thirty-two page illustrated booklet is of vital interest to every farmer in the United States. It answers the questions you have been asking. It solves the problems you have been wrestling with. It gives you just the kind of information about tractors and tractor farming that you have been looking for. Sent free to any one. Mail the coupon today for your copy.

Why the Cletrac TANK-TYPE TRACTOR Best Meets Your Needs

The *Cletrac* is a "year round" tractor We believe that we can conclusively demonstrate to the average farmer that he can get *more* work out of the Cletrac *more* days in the year than out of any other tractor on the market. The Cletrac is invaluable in winter as well as in summer. It pays you dividends in the fall as well as in the spring. It is a "year round" machine. Send for the booklet shown above. It will open your eyes to the tremendous possibilities of tractor farming with a machine that serves you *twelve months in the year.*

The *Cletrac* has a wider range of use It is small enough to be used economically on light jobs, yet powerful enough to handle the majority of the so-called *heavy* work about the farm. It plows, harrows, plants, reaps, binds, threshes, hauls, cuts ensilage, fills silos, saws wood, and does practically all the work formerly done by animal and stationary power.

The *Cletrac* is built to stand hard usage It is rugged—*and powerful.* It is designed and built by practical men who know what a farm tractor must stand. It is economical in its use of kerosene and oil.

Don't wait! Get your *Cletrac* now Orders are coming in fast and we are filling them as rapidly as we can. In another month we will be behind again. If you want your Cletrac promptly *order it now—today!* Don't wait! Every day's delay means a later start in reaping the greater profits that are bound to come with year round Cletrac farming.

Send for this booklet "Selecting Your Tractor." It goes into *your* problems—*and solves them.* It doesn't do a lot of theorizing but gets right down to cold hard facts that are of real live interest to every progressive farmer. Fill out this coupon *now*—and mail it *today.*

WHY IS JUNE DROP?

Continued from Page 90

distress all through the winter, some trees bloomed in January and again in March and in June. The bloom was more or less erratic, sometimes the whole tree, sometimes one side of a tree and the last bloom, in June, was evenly distributed over the trees and set quite a little fruit which subsequently dropped.

That the hot weather is a contributory cause is generally admitted, but that it is the primary cause as claimed by some writers would seem to be disproven this season as most of the fruit had fallen before any hot weather came and, in fact, compared with previous years, we have had no hot weather yet. The bulk of the fruit that fell in the San Joaquin Valley had fallen before June 1 or had taken on the characteristic yellow color of the orange that is sure to drop.

In some cases the trees showed a lack of vigor and a dying of small branches, that for want of a better name has been called die back. Some of the die back has the characteristics of citrus blast, and it may well be that in some cases a mild form of this disease is the cause of the trouble. Another abnormal condition is shown this season in the heavy leaf drop. Almost all the older foliage is turning yellow and dropping off. This is quite noticeable whereas in ordinary years the fall of citrus leaves is a hardly noticeable occurrence.

Many growers complain that the trees that generally produce the heaviest are this year producing the lightest crop and in one grove those trees fertilized heavily with stable manure last season are carrying practically no fruit while other and apparently less vigorous trees are bearing a moderate crop.

I have myself noticed the extremely patchy manner in which the crop is showing up this season. A tree here and there will be loaded while trees on either side and in the same row will have no crop. This in cases where all trees have had the same treatment.

That this is caused by climatic conditions is hard to believe. Navel oranges have been raised successfully in California for many years and it is hardly reasonable to suppose that the older trees would now change in their reaction to a climate they have withstood successfully for 20 or 30 years.

It would seem more reasonable to suppose that some element of the soil had become deficient and deprived the trees of some support to which they had been accustomed or else that some deleterious substances had been deposited in the soil by the irrigation water, from which a toxic condition had arisen.

With younger groves on virgin soil this could not apply to any great extent and here it would be wise to consider for a moment how far these young trees are from the parent stock and to look for some deterioration in the trees due to the well known faculty of plants for "running out" when not grown from consistently selected buds. For many years buds were "consistently" selected from sucker growth and the trees grown from such water sprouts may well tend to grow their luxuriant foliage at the expense of the fruit.

Some instances have been reported where the use of windbreaks combined with summer cover crops have proven very beneficial. This system requires much water and in many cases more than is available. It is, however, well worth trying out. Care should be taken, however, that a summer cover crop is planted and not the winter crop left over until summer before turning under.

To sum up the situation from the standpoint of the grower it would seem that those trees having the best general care are least susceptible to June drop.

That plowing should be done in the fall or early spring.

That fertilizer should be applied in time to insure the trees being in a good vigorous condition when the fruit is setting.

That care should be taken to supply sufficient moisture and that where a summer cover crop is grown it should be sown early enough to enable it to have a lush growth by the time the warmer weather comes and that sufficient water be supplied for the needs of both crops, otherwise if there is a shortage the trees will be the ones to suffer.

It is quite possible that a system of mulched basins, especially combined with an overhead irrigation system, would solve some of the problems of June drop, and it would, I think, be interesting to hear from Cultivator readers who have experience along those lines.

* * *

R. H. Shoemaker, Tulare County

Generally speaking, this district is in good shape as far as the set is concerned, excepting on certain soils. However, we do not think our growers use sufficient fertilizer to raise heavy crops and until such time as there is more interest taken in the fertilizer question our navel crops will not be very heavy

* * *

E. L. Koethen, Riverside, Riverside County

Drop has been more usual but not equal to drop two years ago It is doubtless due to the sudden advent of the hot weather Besides the hot week was attended with the dry north wind which seems always to increase the drop.

No special effort was made to control it except that it is advisable from all past observation to keep the soil well supplied with moisture. Wherever the soil has been deficient in moisture at the critical period there has been an increase of drop.

Pruning that was done just previous to the advent of the hot wave lessened the drop on those trees. Well pruned trees all show less drop than unpruned trees.

Observation teaches the writer that everything should be avoided at this critical period that will in any way devitalize the trees; a shock from too little water or an excessive long run, plowing so deep as to disturb any of the feeding roots, a lack of sufficient plant food in the ground or unavailable food or any other adverse condition will increase the drop.

A careful survey of a large number of orchards where the history of the orchard is known has resulted in the inevitable conclusion that in this section at least the drop is almost invariably in proportion to the environment of the trees this year at least That is, orchards that are in perfect care as to all the essentials of fertilization, cultivation, freedom from insect troubles, frost and all other adverse conditions have at this time a full setting of fruit on the trees. This down to an entire dropping of the entire crop where the conditions are all unfavorable

There were one or two apparent exceptions to this rule, but we were convinced that if all the conditions were known the rule would hold good in all cases.

The Fall Poultry Shows

By Jean A. Koethen

IT is a good thing perhaps that breeding fancy birds and producing commercial eggs, however interdependdent they may be in fact, are externally two distinct and separate branches of the poultry industry. If they were not there would be no summer vacation for anybody. As it is, the commercial folks, who see their pullets well started and their old hens just going into the molt, are laying off, while the fanciers, who have to get through hatching earlier, have had their rest, and August sees them hustling back onto the job.

A good sized job it is, too, and getting bigger every year. What with the old fellows, like Mr. Walthew and the Goodacres, and Mr. Harrison, who have had their shoulders to the wheel for years, and the little new chaps, with all their high aspirations for the blue, or at least the yellow, and the women who have broken into the magic circle and now can't be left out, and all the crowd of "better poultry" people, and the backlotters who know they only want a chance to become fullfledged fanciers, and the folks that have read, and the folks that have heard, and the back-to-the-landers, but mercy on us, where is it all going to end? The whole world seems to have started out after chickens.

I have a neighbor who several years ago bought a setting of fancy eggs. That fall she had one bird so promising that she took him to a local show and he took first. Then she took him to the Los Angeles show and again he took first. She sold him for $25, but he proved to be such a fine breeder that his new owner sold him, if I am not mistaken, for $75. Reads like a fairy story, doesn't it? Every year since that woman has bought eggs from the same breeder and hatched birds for the shows, but this year she is hatching from her own stock. Hers is just an ordinary backlot establishment, with the difference, perhaps, that she has a good cow. And this is what thousands of women are doing, and thousands more are planning to do. The backlot fancier has come to stay and is a immense factor in the boosting of the poultry industry.

Now all this zeal and effort has as its foundation the poultry show. If there were no shows there would probably be no "better poultry" movement. Egg-type is not quite as tangible, not as easy of apprehension, as blue and red ribbons and beautiful plumage. And so we begin with the most tangible things. Later on we shall work up, some of us, to scientific breeding for high production. The poultry show has always been, and always will be, the greatest single factor in stimulating an interest in high class poultry.

Since the war taught us to conserve all our resources, utility and fancy are joining hands to this extent, that many breeders of exhibition stock keep their egg records and breed for eggs as well as for points. Leghorn breeders have done this for a long time. I have in mind now three or four Rhode Island Red breeders who are doing the same thing, and who point with pride to their 200-egg averages. I met a breeder a few days ago who told me his flock of Reds had averaged 205 eggs the past year. I mention Reds because I know most about them, but I don't doubt I could hear the same thing in a meeting of fanciers of any other breed. The two go together, eggs and feathers, you can't separate them.

An August Show

The first show of the season comes off this year the 23rd of August. It is not a public affair, just a little private show gotten up by the Rhode Island Club and the Ancona Club, to be held at the Goodacre place at Compton. Only club members are to exhibit, I believe, and only pullets and cockerels are to be shown. As there is to be a basket picnic in connection with the show, the public is not invited, but I fancy any one who has a promising bird of either breed and would like to show it might easily become a member before August 23 by writing to E. A. Weaver, secretary of the Rhode Island Red Club, or to W. H. Hocking, secretary of the Ancona Club. This little show will be valuable to novices since it gives them an opportunity to size their birds up alongside those of experienced breeders.

Fall Shows

The Sacramento show comes on in September. This is always one of the biggest and best. It attracts a large number of farmers from the central and northern portions of the state and is one no regular breeder feels he can afford to miss.

The Riverside show is always held in October. It is not so large as some, but is always, to quote a prominent breeder, "a corking good one." The folks come in their autos from miles around, many from Los Angeles, for the trip is easily made in a day, and enjoy county fair and races and poultry together. Riverside is becoming more of a poultry center every year, and breeders from San Bernardino, Pomona and Ontario always make a good deal of this show. This year E. I. Hammond, who has been secretary since the first show was held, some five of six years ago, retires, and Harry Suits, returned soldier and son of the late W. G. Suits, takes his place.

In November there will be, I understand, another Liberty Fair, with its attendant show. In December the Los Angeles Poultry Association will show, as it did last year, and in January comes the big wind-up in the Poultry Breeders' show. It's a bit hard on the birds that have to go to all, but it gives everybody a chance to find out who's who in poultrydom.

HONEY PROSPECTS IN ARIZONA

By B. A. Hadsell

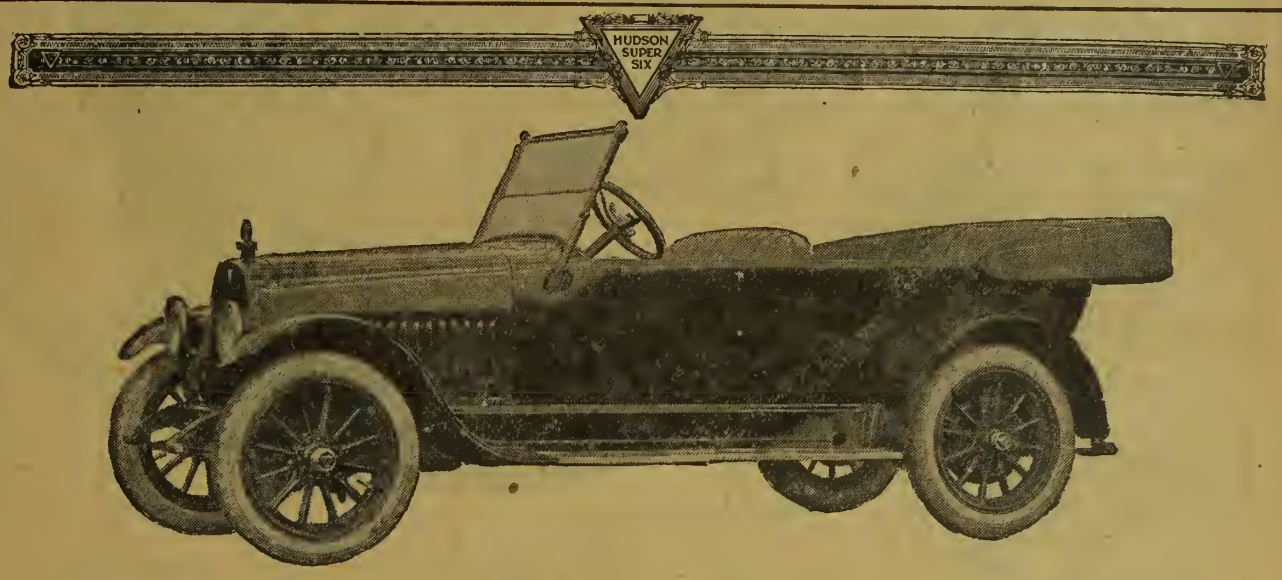
As far as I am able to learn from our bee inspector, foulbrood has only been discovered in two places in Arizona. The bees wintered in a fair condition, but wintered in a fair quite yielded little honey, and very few young swarms were secured. As alfalfa, which has plenty of moisture and irrigation through the winter, is so rank and the blossom so deep that the honeybee can not reach the honey or fertilize it for a seed crop; it is therefore pastured or mowed for hay. But the second and later crops, if not overirrigated, yield heavily in both honey and seed, providing there are no other insects to suck the honey from the bloom during the night. For the past few years small insects and butterflies have greatly reduced the yield of honey. This year the bloom is alive with insects. Many of the apiaries so far have not secured enough to winter on. And beekeepers in Southern Arizona report only about one-fourth of a crop. It is possible that some honey may be gathered yet from alfalfa and cotton

Considerable rain has fallen through this section, giving plenty of water for irrigation with prospects for heavy crops of cotton, maize and alfalfa. The biggest crop of wheat and barley ever produced in this section has already been thrashed.

"Father, what kind of beasts were the rams they used so much in the civil war?"

"They were probably the ancestors of the ewe boats of today, my boy."

A live wire won't get stepped on.



What Car Now Rivals The Hudson Super-Six?

Experience Gained in Building 60,000 Super-Sixes Result in the Car Which Men Say Has No Rival

Owners of earlier Hudson Super-Sixes—there are 60,000—are the most appreciative appraisers of the new model.

They know the reliability of Hudson endurance and have long said it was potentially the greatest car built. The improvements their experience has suggested have been made. Annoyances that have been regarded as inevitable to all cars have been eliminated.

With practically every dealer, his first sales of the new Hudson Super-Six were made to those who have owned Hudsons for years.

They Saw Qualities You Will Want

This is the tenth year of Hudson leadership. The Super-Six is four years old. When it came the trend was towards motors of many cylinders. But its freedom from vibration, obtained by a patented motor which added 72% to power without increase of size or weight was what had been sought for. Smoothness meant easier riding and greater endurance.

The Super-Six established its leadership in these qualities in every avenue open to such proof. It became the most famous speed car.

But the Super-Six was not designed as a race car. It merely established its speed qualities in the development of its value as a reliable enduring car such as you want.

Those qualities were established with the first Super-Six. Subsequent models revealed the refinements that came only from experience. Each year saw an advancement over previous models. This new model attains the ideal for which we have sought.

No other fine car is so well regarded by so many people. There is a Hudson Super-Six for each six miles of improved roadway in America. You will see more Hudson closed- and chauffeur-driven cars on Fifth Avenue than of any other make. It is the choice car of the business man, the farmer, the rancher, the mountaineer and the tourist. With changes that can be made in any Super-Six, it is the car upon which race drivers rely to win prizes in 500-mile speedway events or in the most famous road races.

How It Was Improved

The new Super-Six starts easier, rides easier and runs smoother. All its excellent qualities you know are retained—in many instances, enhanced.

Owners of earlier Hudsons see its finer values as you detect the matured nature of a friend in whom you have long admired qualities of sturdiness and reliability.

Each season has seen a Hudson shortage. Reports from dealers indicate sales are increasing faster than production. Buyers have waited months to get the car of their choice. You will do well to decide now.

'Chain'

'Usco'

Take it in the Car

Think how your car shortens those trips to town!

Going or coming—carrying any one of the hundred and odd things you have to carry, how much it means to you in time saved, alone!

Give it tires that will vouchsafe its greatest usefulness and most economical operation.

Experience has taught hundreds of thousands of folks—both in the cities and on the farms—that United States Tires are good tires; the best tires they can buy.

Last year, when thrift was a necessity and dependability vital, United States Tires showed the remarkable superiority that has always marked their performance.

That is one reason why the 1919 sales of United States Tires are far beyond any previous demand.

Another big reason is this:

There are five separate and distinct types of United States Tires—among them tires that will meet—and meet exactly—any existing need for tires. This means greatest economy, longest mileage and most satisfaction all 'round.

United States Tires are Good Tires

The United States Sales and Service Depot Dealer in your neighborhood will gladly point out the tires that will serve you best. Let him help you.

Turning the Stubble Under

TiziT TiziT

Tizit Spray

Shows Big Results on White Rose Ranch

Four years ago the 20 acre orange and lemon grove of the late Kaspare Cohn at Montebello was badly infested with Black Scale although fumigated seven years out of eight previous to that time.

There was perhaps no more badly infested grove in Los Angeles County.

Mr. Enyart, the manager, was discouraged on account of the dirty condition of the grove and its non-productiveness. He was persuaded to try TIZIT SPRAY. This was in 1915 and Tizit has been applied each year since.

On July 25th, 1919, the grove was carefully inspected by Mr. Enyart, Mr. Ben R. Meyer, administrator of the estate and Mr. Wyliie, citriculturist of the TIZIT SPRAY CO. After a careful inspection of all parts of the grove Mr. Enyart said:

"If I were offered $1.00 each for every live Black Scale I could find on this ranch or $2.00 per day hunting them, I would take the $2.00."

The crop on this grove in 1918 was the best in ten years and this year another splendid crop is set.

The cost of spraying these 20 year old trees with TIZIT SPRAY has been approximately $10.00 per acre per year. Figure the difference yourself between the cost of this and the cost of fumigating, and the results.

Another grove in the Montebello district which has not received a pound of fertilizer in five years but has been sprayed in the bloom has a crop set this year that is truly phenomenal and the owner attributes it solely to the use of TIZIT SPRAY, which has been used exclusively.

Investigate this thoroughly tested and proven eradicator of Black and Citricola Scale.

You can clean and protect your grove with TIZIT in a most effective and economical way.

Our citriculturist, Mr. Wyliie, will confer with you regarding your scale troubles.

3 PAIR OF HANDS-

A Saw, a Hammer, and a Monkey Wrench are all you need to Build

THE INDIANA

Still not too late to have your

INDIANA SILO

ready for this harvest-time

As soon as your order is received we ship complete directions for buildings. The complete Silo is shipped by the time your foundation is built.

You need no skilled carpenters to erect the Indiana Silo. The usual size is easily put up in two days with a couple of unskilled helpers, a saw and a hammer, and a wrench.

—and when it's up you know it's going to STAY UP.

The straight grained fir staves, held firmly together with shaped steel hoops form a wall that will not burst. The silage juices actually preserve the fine fir fiber.

Send in right away for the full statement of the EASY TERMS and a blank contract.

SEND FOR FREE SILO BOOK, TOO

Address Dept. C

The Chas. K. Spaulding Logging Co.

SALEM, OREGON

NO WASTED SILAGE

The Air-tight walls and doors of the Indiana Silo keep the silage sweet. None thrown away. It's *all good* in the Indiana.

"Kissel" Motor Trucks

Are Money Makers For the Farmer

For hustling around the ranch—going into open fields where trails have never been blazed—hauling heavy loads where need be—or speeding to town over boulevards the "Kissel" truck is the farmer's standby.

One extensive farmer, who has a "Kissel" truck and several others, says, "The 'Kissel' is the best truck we own. We put it through every day where our other trucks won't go, and

I only wonder how it does it."

Gear ratio to suit the farmer's needs.

Extra large loading space.

¾, 1½, 2, 3½ and 5 Ton Models.

LAST CALL

THE WEST'S GREATEST

HAMPSHIRE SALE

Ortega-Underhill Rancho

Santa Barbara

Wednesday, August 6

65 BRED SOWS AND GILTS 65

This sale will afford a real opportunity for the selection of Hampshire breeding stock that represents as good blood lines as the breed has produced. Every sow and gilt has been bred to our great herd boars and every one is guaranteed to be a breeder.

Remember that Hampshires are the coming breed of the West and that now is the time to lay a foundation for a sure and profitable business.

Hampshires Are Popular Because:

They are prolific, good mothers, splendid rustlers, make rapid and economical gains and are vigorous.

Hampshires are the Hogs of No Regret

Better Grasses for Forage and Silage

ONE of the greatest needs of the California stockman is for pasture or forage grass. In seasons of abundant rainfall the rich covering of wild oats, bur clover, alfilaria, Bermuda, salt grass, Australian salt bush, and even foxtail, affords rich pasture. In some sections the underbrush, bunch and many other grasses cure so as to afford a living for some of the stock. Still the stockman asks for something which will grow with a minimum of water and still make rich luscious pasturage, soilage and silage. Years ago the state experiment station of the University of California investigated and introduced seed of various plants which have been tested.

One of these, a so-called millet, oryzopsis miliacea, was first introduced nearly a third of a century ago. Some of it was sent to San Diego County, scattered on the hills, and is now developing into a grass of remarkable economic worth. This is a low-growing but very rich forage which is exceptionally satisfactory to all live stock on which it has been tried.

But this is only one of the grasses which have been introduced within the past few years.

To give visible evidence of the worth of some of these grasses the Aggeler and Musser Seed Company made experimental planting in a small plot of ground in Los Angeles. Soil conditions are not of the best, but water has been applied to give a good one year test of a great number of these grasses. The plot has been under the direct supervision of H. L. Musser who is a decided enthusiast in the matter of things which will prove of economic value to California. There are plots of Red Cob Ensilage corn, Eureka Ensilage corn, Orange County Prolific corn, Hickory Cane corn, Pima and other corns. Then there are millets, a dozen varieties, rows of Napier, Para, Guinea, Cocksfoot rye, or wild rye, Fog grass, Paspalum, Billion Dollar grass, Rhodes, Natal, Perennial and Italian rye, brooms, forage crops of various types, sorghums and a brand new introduction, Teff grass.

The Indian corn which is being tested is all of the silage making type. Some of it was 13 and 14 feet in height. The Rhodes grass has been tested in this state for a few years, and from its manner of growth on the test plot it appears it should have more general planting than has ever been given to it. It is shown in illustration Number 1 on this page.

Number 2 illustration shows a really wonderful plant; in fact, it is called the Wonder Forage plant. There have sometimes been known to be as high as 60 husky stalks from one seed. The plant in the illustration had its seed deposited in the ground April 3. This plant was only introduced in 1916 and first planted in Riverside County. As may be seen in the illustration it grows extremely tall, has been known to grow as high as 16 feet. It is estimated that it will produce 40 tons of silage per acre.

Another type of grass, more of a pasture plant, is that shown in the lower left hand corner of the illustration. This is Teff grass, Eragrostis Abyssivica. Mr. Musser has lifted one plant which shows remarkable growth of fine nutritious grass. This grass is being tested on alkali land and so far has given exceptionally good results under most trying conditions. It is also known to do well on dry hillsides and even under trees. It is an annual and seeds freely.

Forage Grasses and Silage Makers are Being Tested Out

1.—Mr. Musser standing on post holding Rhodes Grass plant, seed for which was planted some three months ago. Prof. Keinholtz standing by Mr. Musser's side. 2.—Wonder Forage plant just beginning to seed out. Sometimes as high as 60 stalks will stool from one seed. Seeds from this plant placed in ground April 3. 3.—A bunch of millets. Taller millet in background, Indian; shorter, in foreground, White Wonder. 4.—Teff Grass, one of the latest to be introduced from Australia. 5.—Smilo, introduced many years ago. It has persisted in growing on the dry hills of San Diego County. It is now being more generally planted. 6.—Broom Corn, taller variety in background, dwarf variety in foreground.

Mutual Fire Insurance Companies Need Uniformity

NEARLY 2000 farmers' mutual fire insurance companies in the United States have a total of $6,000,000,000 of insurance now in force. These companies in general have shown a high degree of stability and have proved of much value to their members, specialists of the United States department of agriculture say in Department Bulletin 786. These companies are organized in all states except Florida, Louisiana, New Mexico, Arizona and Nevada, more than four-fifths of them being located in the Middle Atlantic and North Central states.

Of the 1161 companies replying to questionnaires, 124 were incorporated by special acts of congress, while 967 were incorporated under general statute, and 21 existed as voluntary associations without incorporation. The smallest membership of any company was 25, and the largest was 32,433, the average membership being 1532. The prevailing plan is to allow each member one vote regardless of the amount of insurance or number of policies held. More than four-fifths of the companies follow this plan.

All the companies returning a questionnaire gave information concerning the hazards against which insurance was written. Thirty-three companies insured against fire only, 958 against fire and lightning, and 170 gave combined protection covering fire, lightning and windstorms. The giving of the last named form of protection can be engaged in with safety only by the larger companies with their risks widely distributed. The more local mutuals in many states have cooperated with one another in the organization of statewide companies to care for the wind storm insurance of their members.

Among the 898 companies which reported the maximum single risk was $15,000, and the lowest $750. A total of 349 companies reported their maximum single risks as large as $4000, and only 58 companies provided for a maximum of less than $2000. The average maximum risk for all companies reporting was $3994.

While rigid uniformity may not be desirable a reasonable approach to uniformity in the plans and practices, at least within a given state, would be a material advantage. The general public would be more easily convinced of the soundness and real value of these companies. The approval and support of the insurance department of the state would be more easily secured than is sometimes the case under present conditions. Financial institutions which lend money to farmers would more readily accept the policies of these companies as collateral, and lastly the companies themselves would find it easier to cooperate with one another in matters of reinsurance or joint insurance, as well as in meeting other problems that arise.

Agricultural News Notes of the Pacific Coast

Northern California

Many wine grape growers have perfected arrangements for drying.

Newcastle, Placer County, reports plums selling around $4.85 to $5.25 per crate.

Vaca Valley fruit growers have been shipping to canneries outside of Solano County.

Nevada County reports outlook for pears exceptionally good; plums and apples also looking well.

Vacaville has now shipped about 500 cars of fresh deciduous fruits, shipping each week approximately 60 carloads.

One Vacaville farmer has produced an exceptionally fine crop of tobacco which he thinks will command a dollar a pound.

The cannery at Yuba City has a baby checking room where mothers working in the cannery have the children cared for

The Butte County farmers bureau is making a definite campaign against "citrus blast" which is affecting many of the orange groves.

Gravenstein apple picking in the Sebastopol section is in full swing. It's the biggest crop in the history of the industry in Sonoma County.

There has been some injury to the grape crop of Sacramento Valley because of exceptionally warm weather during several days about July 15.

Tuolumne apple orchards are bearing their biggest crop ever and the growers are giving much attention to spraying for codling moth and expect big returns.

The California Tractormen's Association has engaged 200 rooms at Sacramento hotels during state fair week. They propose to be the whole show—pretty nearly.

The Penobscot Farm in Eldorado County and McFarland Farm in San Mateo County have received the state's largest shipment of Ayrshires. It is from Canada.

Colusa County's barley crop is nearly harvested. It is the largest in some years. The Sacramento River steamers are moving the crop to market as rapidly as possible.

Shasta County is fighting the Iron Canyon irrigation project. The claim is made that the dam will back up waters of the river so as to destroy $15,000,000 worth of property.

Sacramento is becoming headquarters of garden pea seed. This year's crop has been exceptionally successful. Over 1000 acres are planted in the Natomas district alone.

The first year of the cow testing association of Alameda County is just ended and steps are being taken to continue the work another year It is anticipated many new members will be added.

Rio Vista, Solano County, had the biggest asparagus cut of any year in its history. The California Packing Corporation's plant put up over 200,000 cases of grass; this is 30,000 cases more than last year.

Sacramento Valley canners piece work is on the following schedules: For preparing fruit—asparagus, per 100 pounds, 22 cents; cherries, 65 cents; apricots, 47 cents; cling peaches, 31 cents; free peaches, 20 cents; hand-peeling peaches, 50 cents; pears, 55 cents; plums, 16 cents

Central California

San Joaquin County farm bureau is talking county fair.

U. G. Strader, the Ceres Dutch Belted breeder, died recently.

A $200,000 potato dryer or dehydrator, is to be installed at Turlock.

A 135 acre barley field near Modesto went up in smoke last week.

Bartlett pears are now selling in carlots at approximately five cents each.

The first dried apricots delivered in Fresno County were brought in on June 25.

Cooperative associations never had such control of dried fruit markets as this year.

150 acres of Lindsay grown tomatoes will be packed by the Terra Bella Canning Company.

Commissioner Marchbank of Madera County is outlining a campaign for squirrel warfare.

The Farm Owners and Operators' Association will install grain graders at its Stockton headquarters.

California Dairy Council is discouraging the suggestion that Japanese milkers be employed in dairies.

During the height of the harvesting season in apricots at Hanford one association employed 1287 people.

Fresno estimates the San Joaquin Valley will ship 1500 carloads of peaches to Eastern markets this season.

Tulare County Cooperative Poultry Association is materially increasing its membership and amount of business.

Farmers of San Joaquin County who refused to abate the squirrel pest on their lands are being sued by the district attorney.

San Joaquin County farmers, especially those about Linden and Waterloo, are planning volunteer fire fighting organizations.

Fred Brosius, commissioner of Sacramento County, is making persistent fight on deceptive packs in fruit and vegetable markets.

A public sale of fat hogs at Tegner by the Stanislaus and Merced County farm bureaus brought what is claimed to be the highest price paid in this state, $19.75.

The Monterey County Cattlemen's Association recently met at Salinas and discussed cattlemen's interests, especially appealing for the ending of over-pasturing.

Representatives of various cooperative creameries met recently in Fresno to discuss turning the plants over to San Joaquin Valley Milk Producers and arranged to sell ten plants to that association.

The cantaloupe fields near Turlock, Stanislaus County, are being attacked by a fungus which it is claimed has reduced the crop at least 50 per cent The state horticultural commission is investigating.

Kings County creameries are paying: Lucerne Cream and Butter Co., 66 cents; Los Angeles Creamery Co., 66½ cents; California Central Creameries, 64.75 cents; Riverdale Cooperative Creamery, cream 65 cents, butter fat in milk, first grade, 82 cents, second grade, 77 cents; Kings County Creamery, 63 cents.

Southern California

Apricot growers are anticipating $37.50 per ton for pits.

Riverside citrus orchardists are installing new type orchard heaters.

San Bernardino is planning a fine county exhibit at the Riverside fair.

Nematodes have been causing serious losses in some cantaloupe sections.

Flowing artesian wells are showing a greatly reduced flow compared with former years.

Field and forest fires swept over 6000 acres of Etiwanda and Lytle Creek Canyons.

Lima bean crop of Ventura County, will be but little more than 60 per cent of normal crop.

Yucaipa shipped 4500 boxes of early peaches and is now busy shipping early summer apples.

Two canneries at Pomona put up in one week 1,300,000 pounds of apricots. The payroll for the week aggregated $13,000.

New edition of "Agriculture in the Imperial Valley" by W. E. Packard is being issued by the college of agriculture.

Architects are in consultation with Bruce Drummond and date growers of Indio devising plans for a date packing house.

A great number of women of the former Women's Land Army went into the apricot sections and aided in harvesting and cutting.

Citrus growers of Pomona in Los Angeles County, have asked an injunction against the city of Pomona enforcing its anti-smoke ordinance.

Orange County reports: "Valencia crop fair". However, Valencias have been more seriously affected by a few hot days this year than any preceding.

San Bernardino people near Urbita Park have declared war on the bull frogs because of their rich deep basso. One was killed which measured 13 1-3 inches.

The San Jacinto and San Bernardino mountains were given a terrific thunder shower, nearly an inch of rain falling and aiding many of the summer irrigators.

Rev. Mr. Gillan of Coachella Valley recommends a date association to market the products of the valley, the association to be founded along the lines of those followed by the fruit exchange.

A petition has been signed by a large number of irrigators under the Palo Verde levee, asking for changes in the management of affairs, especially with reference to the work of two engineers.

The Poultry Producers of Southern California Inc. are signing up contracts which will go into effect on January 1, 1920. This contract to take the place of the one which has been in existence for the past three years.

San Dimas, Los Angeles County, is still discussing the possibility of large water storage in the hills. Waters of the San Gabriel River have been filed upon to the extent of 25,000 acre-feet.

The County Beekeepers Association of Ventura have resolved, in a formal statement to the board of supervisors of the county, that the district attorney investigate matters in connection with the office of the county bee inspector.

The Coast and General

Schools of Arizona will cost $564,017 for next year.

Hood River is packing immense quantities of cherries.

Corn acreage in Arizona shows an increase of ten per cent.

Pima County, Arizona, is to vote on a bond issue of $1,500,000 for good roads.

The assessed valuation of mines of Arizona shows an increase of $7,000,000 over the valuation of 1918.

The state of Arizona is to have 300 trucks and other road equipment from the government for use on state and federal roads.

Heavy rains have occured throughout the entire state of Arizona. This has resulted in much benefit to the range and considerable damage to roads.

Klamath Falls, Oregon, started a campaign against grasshoppers with a showing of 120 of them to the square foot. The menace has been greatly reduced.

Retail dairymen supplying the Phoenix market have been obliged to raise the price of grade B milk from 12½ cents to 14 cents, on account of a ruling of the city milk inspector requiring them to keep it cooled to a temperature of 60 degrees.

It is probable that an election of the Salt River Valley Waters Users will be held in the near future to decide whether or not they will purchase and operate a cement plant, not only for the benefit of the association but for the manufacture of cement to be used in road making. It is said that by manufacturing the cement locally, a saving of more than $1,000,000 will be made in the building of the system of roads voted on at the recent road bond election.

A new system of checking the amount of water used by farmers has been adopted by the Salt River Valley Water Users' Association. Under the new system, each water user is notified of the amount of water consumed by post card the day following his run of water. This enables the farmers to check the amount used against the amount purchased, to prevent any possible errors, and enables the farmer at all times to know what his reserve supply of water is.

The agricultural experiment station at Tucson has issued a new bulletin number 87, entitled "Insect Pests of Interest to Arizona Cotton Growers" This was written by Dr. A. W. Morrill consulting entomologist of the agricultural experiment station, and former state entomologist. At the present time he is an expert on cotton diseases and cotton insects, employed jointly by the Arizona Cotton Growers' Association and the Arizona state horticultural commission.

The cantaloupe season in the Salt River Valley will be shorter than usual this year owing to weather conditions which ripened the melons faster than they could be gathered or shipped The total shipments will run probably about 1600 cars for the season. First shipments were made June 27. Early sales in Eastern markets were very good, some were selling as high as $7 a crate. Heaviest shipments in one day were 193 cars. Last year the heaviest shipments in any one day were 82 cars.

Further Comments on the June Drop

By Robert W. Hodgson

THE June drop continues to be one of the most important problems facing the grower of Navel oranges; it constitutes the most serious difficulty standing between the interior valley orange grower and prosperity, but the experience of the past three years has emphatically indicated that June drop may be a most aggravating problem even in the more favored coast counties. And not only are complaints voiced regarding the drop in Navels, but much concern is being manifest during the present season particularly over the serious shedding of immature Valencia oranges. The shedding has apparently even spread to lemons of recent years, much complaint being registered regarding the dropping of young lemons during the past two seasons.

In company with many others, both growers and investigators interested in this problem, the writer recently received a questionnaire from the Cultivator asking for the results of his observations during the present season and has read with a great deal of interest in last week's issue replies received from growers in many parts of the state. Having been connected with an investigation of this particular problem carried on during the past four years, the writer has been particularly interested in getting the viewpoint of the grower regarding the cause of the "drop" and has been especially pleased to note that practically every reply published reflects ideas regarding its cause which are in direct accord with the results of the investigation. In almost every reply the feeling is expressed that there is a definite correlation between the amount of drop and climatic conditions occurring during the critical period, which is precisely what the aforementioned investigation has clearly indicated. The idea is also frequently given utterance that one of the most satisfactory methods of avoiding heavy losses by the "drop" is to keep the trees in as vigorous and thrifty a condition as possible, which is also in accord with our findings. The reply of Geo. W. Waterbury of Corona is most interesting. He could hardly have written a statement more closely in agreement with the writer had we two been comparing notes. Another point of interest is the kindly feeling toward the summer cover crop where it is possible to grow it, expressed by a number of growers in their replies.

Although the Valencias and lemons have been dropping to an unusual extent this season we must still admit that the June drop is primarily a Washington Navel problem. Although it is to be presumed that the factors operative in causing abscission in the Navel might also and probably do act to cause more or less shedding in the two other important citrus varieties, there are still other factors which may have to do with this dropping and which play no part in the June drop of Navels. Such are, for instance, the presence of seeds. Other things being equal, the fewer the seeds the more likelihood there is of the fruit dropping before reaching maturity. Rather extensive researches along these lines with apples and pears in the East have shown a very definite correlation in this regard, and there is no reason why the broad general principles uncovered should not apply to citrus varieties normally bearing seed. The unusual shedding of lemons and Valencias may therefore be connected with poor pollination or failure to develop normal ovules in the fruits. But what have been the conditions this spring conducive to a heavy drop of the Navel oranges?

In many respects this season has been very similar to that of 1917 when the famous heat wave occurred. The greatest difference has been in the magnitude of the temperatures reached. During the spring months weather conditions have been dry and relatively cold. In fact, one might say they have been ideal for the trees in every way, just as in 1917 the state in general experienced a delightfully cool spring. The disastrous feature of such climatic conditions, however, is the fact that they do not favor hardening up of the young fruits so as to make them able to withstand hot dry weather. Suddenly with the advent of June there came a heat wave with three days of temperatures of 100 and better. The result was just what was to be expected, a heavy shedding commencing about the seventh of the month. Had we experienced a heat wave of the magnitude of the famous 1917 "sizzler" nearly everything would have gone just as it did then. The only thing that saved the crop was the comparatively low temperatures.

This statement of course has to do with Southern California in particular. In the San Joaquin and Sacramento valleys it is not so much high temperature which induces the drop as low atmospheric humidity. There the drop comes almost every year and has ever since Navel oranges have been grown. To be sure in certain years it is much worse than others and may be correlated with climatic extremes which occur, but it is a more or less regular phenomenon.

Then another condition generally regarded as conducive to a heavy drop, and which occurred this season, lies in the heavy bloom. In most sections the bloom was excessively heavy. Some recent work done by Heinicke on apples in New York is interesting in this regard. He found that trees which carried a very heavy bloom set and matured only 14.1 per cent of the blossoms while trees carrying only a normal bloom matured 73.8 per cent of the flowers. It stands to reason that a tree bearing many times the number of blossoms it can possibly mature is under a much heavier strain than one carrying but few more than it can successfully mature. And under such a strain it would only be natural to expect a much heavier shedding of the blossoms. And not only is a heavier fall of blossoms to be expected but also a generally weakened conditions among even the more vigorous flowers which cannot but be conducive to a light set of fruit. And the fact remains that the set itself was comparatively light this season, in most districts.

It is not reasonable to expect weak or sickly trees to bear satisfactory crops. Trees permitted to suffer for lack of water, trees underirrigated, trees not given adequate fertilization and trees neglected in any way cannot be expected to bear satisfactory crops.

There is, however, a June drop which has occurred on the healthiest trees, given every possible care. This is the true June drop, all others being a natural thinning down to the normal crop. Our investigations indicated that the true June drop in the Washington Navel orange is occasioned by two very distinct causes, one, abnormal water relations set up between the leaves and young fruits under severe weather conditions, and two, the attacks of a very weak parasitic fungus, Alternaria citri, which also causes a navel end rot of Navel oranges.

There is a delicate water balance or equilibrium existing in all plants, any severe disturbance to which is bound to react more or less detrimentally to the plant's general well being. Water is being absorbed by the roots and being given off as water vapor through the leaves. In order for growth to occur and a healthy condition to obtain, absorption must more than equal evaporation. If for any reason evaporation exceeds absorption, a water deficit occurs in the plant which, if carried far enough, results in wilting and ultimate death from desiccation. The ability of a plant to maintain a satisfactory water balance against more or less adverse conditions largely determines its zone of natural distribution. Thus we find desert plants provided with various devices, structural and otherwise, to reduce evaporation, and in addition with special powers of extracting moisture from relatively dry soils. Plants indigenous to the tropics however, such as citrus, are not found to be adapted to withstanding harsh climatic conditions. In the course of their evolution they have never experienced any such need.

When a deficiency of soil moisture occurs certain plant parts by virtue of their structure and function have a decided advantage over other parts in obtaining moisture. Thus the leaves, being subject to a strong atmospheric pull through evaporation, continue to take the larger part of the water supply to the marked detriment of young fruits if such happen to be developing at that period. Under certain conditions the leaves may actually withdraw moisture from the fruits, resulting in their desiccation. When this occurs many plants initiate a process called abscission and throw off or shed the fruit, and if the necessity becomes severe enough, even drop the leaves.

The June drop of the Navel orange has been found to be the direct result of an abnormal water relation of the kind above described. During hot dry weather the leaves actually draw moisture from the young developing fruits so that there is a periodical swelling and drying out which when continued for several days results in shedding within a week or ten days. This is only what would be expected when we remember that citrus trees originated in the tropics where they are still to be found growing wild in the shade of immense forest trees. Here climatic conditions obtaining during the blooming and critical period before the fruit is set are about as different from those occurring in California during the same period as possible. The atmospheric humidity is high and the temperature not excessive. The atmospheric pull on the leaves for water is comparatively low. With our hardy temperature-zoned fruits and even our desert shrubs experiencing abnormal water relations during periods of intense dry atmospheric conditions, what could be reasonably expected of citrus trees so poorly adapted to withstanding a high atmospheric pull for moisture? The wonder is that they hang on to as much fruit as they do.

Citrus trees have been found to exercise absolutely no control over their water loss; during hot dry periods they are absolutely at the mercy of the elements and react by shedding those parts of the least importance in the economy of the tree, the fruits.

Since the drop is largely due to climatic conditions, obviously measures of control must be largely in the nature of ameliorating climatic extremes which may occur during the critical period lasting between April and July 1. The most effective method of accomplishing this has been by the use of a rank growing early summer cover crop which carpets the ground in the orchard during this period. Plantings at Bakersfield and elsewhere last year, where managed properly, showed phenomenal results in increasing the crop matured.

Of all the crops used to date, Melilotus alba, alfalfa, and buckwheat have given the most promising result. The writer knows of no good reason why Melilotus indica should not prove more satisfactory than any of these. Cowpeas and beans apparently must be abandoned as crops for prevention of the June drop. Where plenty of water is available, planted early enough, irrigated copiously and handled properly, the summer cover crop for prevention of the June drop still holds out the greatest promise of successful control.

Protecting the soil in any way from our intense summer heat has shown beneficial results in preventing June drop. Thus mulching with almost any material was found to be a decided aid in 1917.

Providing a plentiful supply of available nitrogen for the trees during the critical period has been shown to result in a decidedly better crop of fruit.

The influence of pruning on the set of fruit is a subject of considerable interest to growers, some contending that it is beneficial, others insisting that it be avoided as inducing an undesirable shock to the trees. Since most of the true drop is undoubtedly due to abnormal water relations occasioned by the leaves appropriating moisture from the fruits, it would seem that a judicious reduction in leaf surface accomplished by pruning at a period early enough so that the trees would be well over the shock before coming into bloom would have a very beneficial effect. Certainly all suckers and rank growing shoots should be cut out prior to the blooming period for they lose many times the amount of water per unit of area as the heavier, more coriaceous and pulpy leaves.

A certain part of the shedding is due to a fungus, Alternaria citri, which infects the young fruits through the cracks and imperfections in the navel end. The amount of infection and consequent dropping due to this fungus varies greatly from season to season, but apparently has been large during the past two seasons. Some of the affected fruits persist to maturity

OUR ADVERTISERS RELIABLE
We guarantee our subscribers against loss through dishonesty of any advertisers in the Cultivator. We do not attempt, however, to adjust trifling differences between subscribers and honest, responsible advertisers, nor will we pay the debts of honest bankrupts. Notice of complaint must be sent us within 30 days from date of the transaction, and the subscriber must have mentioned the Cultivator when writing the advertiser.

THIS WEEK'S COVER

Summer fallow is keeping some of our tractors busy, and orchard work which continues the year through is keeping many of the lighter power machines in action, but it is possible that more of them have been resting during the past few weeks than will be for another ten months. The tractor and farm power and implement people are anticipating greater activity in their trade during the next few months. The Northern association is making preparations for a great show at the state fair the first of September. The Southern association is planning for a demonstration which possibly will eclipse all others, and the farmers will take advantage of both of these opportunities to secure information as to more efficient and more profitable farming. The two events will be materially different because the one at the fair at Sacramento will be a still exhibit of power and implements while that at Los Angeles will be in the nature of a private demonstration. No public contests are to be staged.

BEAUTIFUL AND FRUITFUL

Nurserymen's associations of the country are uniting in a "More Beautiful and Fruitful America" campaign, and the first proposition is that the nurserymen encourage the campaign not only by propaganda but by producing the highest and best quality of fruit and plants which will produce high quality sought for fruits. The wealth of fruit growers depends greatly on painstaking care on the part of some nurseryman who has hybridized and selected to the end that orchards and fruit gardens have been made more productive.

LESS WHEAT

Several sections of the East are complaining bitterly because drouth, hot weather, rust or other unsatisfactory condition is greatly reducing the prospects for big crop. This seems to be especially true in portions of Ohio. There stinking smut has been one cause which has reduced the output more than any other. An extremely small portion of this smutted wheat reduces the grade of wheat and flour so as to materially cut prices. This trouble may be controlled by seed dipping, and it is presumed the next crop will have more attention paid to modern planting methods.

THE BOARD OF AGRICULTURE

Former Horticultural Commissioner Hecke is now agricultural commissioner for California. The dairy bureau which formerly had its headquarters in San Francisco is now moved to Sacramento, and it and other agricultural activities will be under the direct supervision of one head.

The farmers of the state are hoping for more efficient service from this newly organized department of the state administration and everything indicates that it will be all that is hoped for it. Commissioner Hecke has announced that there will be few if any changes in the personnel of the various bureaus or departments.

METRIC SYSTEM

Now arises a new society, this time to secure adoption by the United States of the metric system. We might feel more sympathy with the propaganda of this association were it not for the tone of the matter which it is sending out: "The two stupidest nations are Great Britain and the United States." German wisdom in accepting the metric system is lauded while the "two greatest?", with emphasis on the question mark, are "trying to do business with Germany's cast-offs."

However, it must be admitted that scientific work usually calls for the metric system and ultimately the United States will come to this more easily handled and common sense system of weights and measures, as it has in its monetary system.

CANNING COMPOUNDS

The time was when many of the housewives of the country used preservatives in all home canning operations. The department of agriculture has taken pains to make thorough investigation and it has determined that this practice is harmful. Within the past few years the practice has materially declined and but few use any other sterilizer than heat. However, there are occasionally those who do, and the department is giving warning that the practice should be discontinued by all. This seems to be made necessary by the enterprise of certain manufacturing chemists who are producing compounds and selling them under various trade names. These preparations usually contain salicylic or boric acid and are entirely unnecessary where proper canning methods are used.

IN THE SHED

House the farm implements. The hot sun of midsummer shortens the life of many a farm implement. To be sure, lumber is high; farm machinery and farm implements are higher. A bit of shade is just as grateful to the tractor or implement as it was to Old Dobbin.

While it's being housed a spare day may occasionally be given to cover some of the bare spots with a bit of paint.

THE FLEET IS HERE

The population of the Pacific Coast will receive its greatest increase this week. The great Pacific fleet which has passed through the Panama canal and is now leisurely floating up the coast brings to us an increase in population of practically 50,000 people in one day.

Heretofore it has been considered that the Atlantic Ocean ports were all of America that needed protection. The wisdom of dividing the forces has been seen and the Panama canal has made possible separating the great fleet of the nation. California is preparing for its greatest celebration.

San Diego is the first point touched Later Los Angeles and San Francisco will give welcome to the boys who have been so efficient in carrying nearly 2,000,000 of our soldier boys across the Atlantic and bringing them home again with scarcely a loss at sea. The fleet is composed of over 200 vessels.

AN EYE ON THE TARIFF

Without question there will be tariff revisions. Some are in favor of making immediate revisions because of war conditions and the effect on some exports. For example, there is potash. It is generally conceded that that industry needs protection. Others think that there should be no revision or change until the country is ready to make a change all along the line. But in any case the question is up.

Farmers interests will be protected if the farmers arise to the occasion and attend to their own protection. Otherwise they will get what their indifference entitles them to. Fortunately strong cooperative organizations have brought farmers together so that it is possible to make their influence felt. It makes little difference whether one is a free trader or a believer in protective tariff when it comes to his own product being discriminated against.

ATTACKING FARM LOANS

A bill has been introduced into congress providing, amongst other things, that that feature of the law which governs farm loan banks, exempting bonds from taxation, be repealed.

The foundation of the federal farm loan scheme has been the handling of the people's money under government guarantee by the farmers at what, from the farmers' standpoint, is a low rate of interest. This has been regarded—by its enemies—as a paternalistic provision under which government money is advanced to farmers at a lower rate of interest than the government would loan to business interests.

Such an idea is entirely in error. The management of the bank is under government control. To secure money to loan to farmers bonds are sold which bear a low rate of interest but are tax exempt. If this tax exemption can be removed banks feel that they will have a more even chance in loaning money to farmers at a much higher rate of interest.

Meantime it's wise for farmers to watch the action of their own representatives and make known their desires as to federal farm loans

THE NEW MOTOR LAW

The new motor, or headlight, law which was passed by the last state legislature went into effect on the morning of July 22. Thirty days will be allowed the motor vehicle people to fit their machines and their driving practice to the new law.

One point which calls for immediate attention — for it may require some time for adjustment—is that relating to headlights. There have been many accidents caused by the glare of headlights, and it is well that action has been taken by the state legislature in this particular. Here is the merest outline of the new law:

Registration

Upon the transfer of a motor vehicle from one owner to another the registration certificate is transferred to the new owner and the registration number remains with the motor vehicle so transferred.

Headlights

Headlights on motor vehicles must be of such force as to permit driver to see any object in the road 200 feet in front of the motor vehicle.

Motorists must comply with the provisions of the headlight law within thirty days from July 22.

None but authorized headlight devices can be used to prevent the glare which the law is enacted to eliminate.

All bicycles must carry a light visible 300 feet directly in front of the bicycle and a reflex mirror or red light on the rear, visible for at least 200 feet.

All horse drawn vehicles must carry a light so arranged that it will be visible from every direction for a distance of not less than 200 feet.

All spot lights on motor vehicles must be so arranged that no portion of the beam of light when measured 100 feet or more ahead of the light shall rise to more than 42 inches above the level surface upon which the vehicle stands.

Rules of the Road

On suburban roads there must be a distance of 15 feet between any motor vehicle and another motor vehicle, horse-drawn vehicle, or person.

The operator of a motor vehicle shall yield the right of way at the intersection of their paths to a vehicle approaching from the right unless such vehicle approaching from the right is further from the point of the intersection of their paths than such first named vehicle.

Hand Signals

Signaling may be done with the hand and arm or with a mechanical or electrical device approved by the State Motor Vehicle department.

When signaling with the hand and arm use these signals:

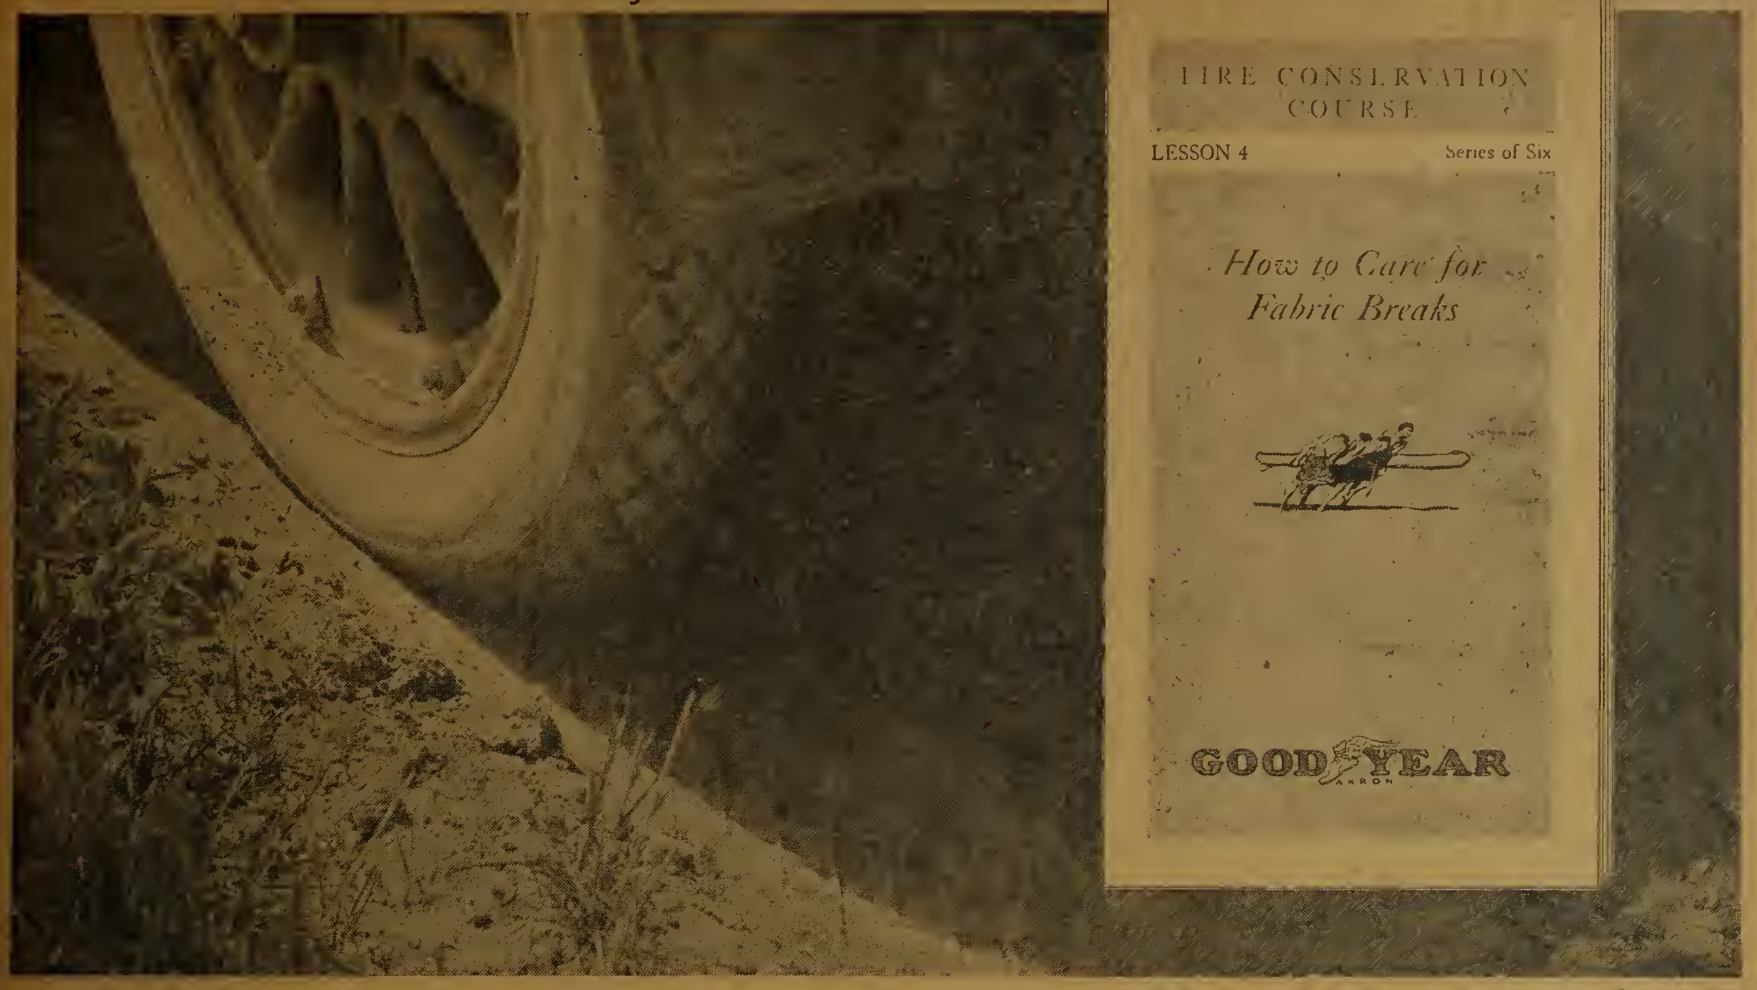
1. Arm straight out—Turning in direction toward which the arm and hand is pointed.
2. Arm pointed upward—Turning in the opposite direction.
3. Arm pointed downward—Stopping or suddenly checking speed.

No baggage carried on the left running board of a motor vehicle can extend more than 12 inches from the body of the car.

Speed Limit

Under certain conditions, chief of which is that there shall be an unobstructed view of the road for a distance of 400 feet in front of the machine, the speed limit on the county highways will be 35 miles an hour.

No vehicle shall be turned around on a public highway except at the intersection of another street or highway, except that in country districts where intersecting streets are few in number this rule will not apply.



Saving 2,000 Miles

by Repairing Stone Bruises

A GOODYEAR Tire that looked perfectly sound on the outside blew out one day. The owner, Mr. J. G. Jenkins, of 2106 Maryland Avenue, Louisville, took it to a Goodyear Service Station. Examination revealed a fabric bruise on the inside of the tire—probably caused by bumping into a sharp curb. The bruise had been neglected so long that it had developed into a serious fracture whose edges caught and pinched through the tube, causing the blow-out. The Goodyear Service Station Dealer advised the use of a Goodyear Rim-Cut Patch. With it Mr. Jenkins got 2,000 more miles from the tire.

◇ ◇ ◇

NOT even the thick muscular Goodyear All-Weather Tread can protect the inner plies of fabric tires when cars are backed sharply against square curbs or strike objects at high speed.

In such cases the innermost layers of fabric are sometimes stretched beyond their elastic limit and some of the threads have to break.

The tire is weakened at this point, the fracture enlarges, and eventually the tube is pinched by the jaws of the resulting fabric break and a blow-out follows.

Generally such tires can be satisfactorily repaired.

Goodyear Service Station Dealers and many car-owners use the Goodyear Rim-Cut Patch to temporarily repair such bruises until it is possible to have them permanently vulcanized.

If the tire is too old to be worth vulcanizing, the Goodyear Rim-Cut Patch, securely cemented in, makes a permanent repair enabling the tire to deliver a great many additional miles.

This most effective inside boot is so constructed that it will repair any possible injury—a cut through the top—a blow-out in the side, or even a rim-cut.

It gained its name many years ago, before Goodyear improvements had produced tires constructed to eliminate rim-cutting.

For Cord Tires the Goodyear Cord Patch is used in the same manner as the rim-cut patch.

Lesson 4 of the Goodyear Conservation Course tells you how to detect and repair stone bruises—ask your Goodyear Service Station for it, or write to Akron.

We also build deep well turbines, deep well plungers, horizontal and vertical pumps for mining, irrigation, drainage.

Make the reading of advertisements in the California Cultivator a habit. They will broaden your knowledge of the manufacturing improvements.

1919 Standardization Chart

A CHART summarizing, or giving at a glance, the provisions of the 1919 standardization law has been prepared by the state commission of horticulture. From it we give:

All fruits, except oranges, must be mature but not overripe, well colored for variety and locality, virtually uniform in quality, free from rots, bruises and sunburn, and must be uniform as to size. In addition they must approximate the same numerical count in each layer.

Oranges must be free from insect and fungous pests, virtually free from frost injury or other serious defect. Sugar content (soluble solids) eight parts to one part of acid and 25 per cent yellow or orange color before picking; substantially colored (75 per cent color) before picking if test is less than eight to one.

Almonds must be virtually uniform in quality, free from insect and fungous pests, and free from other serious defects.

Berries must be mature but not overripe, virtually uniform in quality, free from insect and fungous pests, free from rots, sunburn or other serious defects, uniform as to size.

Onions must be uniform in quality, virtually free from insect and fungous pests, rots, other defects, and same numerical count in each layer.

Grapes not overripe, well colored, uniform, free from insect and fungous pests, rots, bruises, frost injury, sunburn or other defects. They must have a sugar content of not less than 17 per cent Balling scale, all varieties except Emperor, Gros Colman and Cornichon, which must test at least 16 per cent.

Sweet potatoes must be uniform, free from pests, rots, other serious defects, uniform layers.

Walnuts, uniform, free from insects, sunburn or other serious defects.

The apple standardization act is a separate act. It provides that California Fancy grades shall be well grown, mature, one variety, hand picked, stems retained (excepting Gravensteins may be packed as California Fancy with stems removed), well colored, normally shaped, uniform in size. (A variation in size not to exceed three-eighths inch, measured through widest portion of cross section shall be allowed. No apples less than two and one-quarter inches when measured in like manner shall be allowed in "California Fancy" grade, except Lady and Winesap apples, when the smallest size shall be two inches). Well packed, free from pests and diseases, (three per cent of any one defect, not to exceed ten per cent total defects shall be allowed), free from visible rot, dry rot, Baldwin spot, insect bites, bruises, frost marks, sunburn and other defects.

"B" grade requirements the same excepting retained stems not required, neither does the well-colored provision stand. Insect bites which have healed in the process of maturing and which do not cause serious deformity, and slightly misshappen apples shall be permitted and slightly frost-marked or sunburned apples shall be allowed.

"C" grade exemptions are that they need not be so well grown nor hand picked nor stems retained nor well colored nor uniform in size and pack nor free from bruises, frost marks, dirt, etc.

An exception will be made of bruises and other defects necessarily caused in packing.

Stamps designating grade may be purchased from state commission of horticulture at one-half cent each. State inspectors are paid from fund accruing from sale of these stamps. When state stamps are not used the same grade requirements must be met and boxes stamped with proper grade in letters not less than one-half inch high.

A variation of five apples more or less than the number stated shall be allowed.

If variety is unknown to the packer the statement "variety unknown" must appear on the box.

Apples which do not conform with the packing requirements may be sold in bulk to by-products factories or consigned to a packer for packing.

Box Marking

Grade (California Fancy, B or C).
Number in box, or net weight.
Each variety.
Name and address of packer. (Either first pack or repack).
Date when packed or repacked.
No misleading statements.

Standard box, depth 10½ inches, width, 11½ inches, length 18 inches, inside measurements.

Dried Wine Grapes

The state board of viticultural commissioners, Sacramento, has issued Bulletin No. 15, "Dried Wine Grapes" which will doubtless be placed in the hands of every wine grape grower of California. It has to do with the drying of these wine grapes. Prof. Bioletti gives information as to methods and returns. He takes the ground that many of these grapes will be dried for the purpose of later being soaked up with water and made into wine, and calls attention to the steps necessary to produce such a product. The method of making an evaporator for wine grapes is given with photographs and drawings by Prof. W. V. Cruess. However as to general principles of evaporator construction we quote from the bulletin:

By W. V. Cruess

After studying numerous home-made evaporators which have been used for drying grapes in various parts of the state the form described here appears to be the most suitable for the drying of wine grapes during the coming season. It can be easily and quickly constructed by local carpenters and plumbers in any district; it has proved in several years' trial in Fresno County to be a satisfactory and practical type, and apparently is of such design that no patent rights are violated in its construction. This evaporator is also suitable for drying rain-damaged raisins or prunes and for other fruits or vegetables.

Other types of evaporators can be used. The most important are described in Circular 213 of the California Experiment Station. (Evaporators for Prune Drying, W. V. Cruess, University of California Agricultural Experiment Station. May be obtained free of charge upon application to the College of Agriculture, Berkeley, California).

A brief summary of the principles of evaporation as applied to the drying of grapes will give a clearer understanding of the requirements that must be fulfilled in the building and operation of a grape evaporator.

Principles of Evaporation

The principal object to be attained in evaporation is the removal of enough of the moisture from the fruit to prevent spoiling of the dried product in storage or shipment. This, in the case of wine grapes, must be accomplished not only economically, but also in such a way that as much as possible of the grape flavor and color are retained.

Evaporation is the change of water from the liquid state to the gaseous or vapor state. Heat is necessary for this change.

The necessary heat may be furnished naturally by the sun or may be obtained by the burning of fuel. Sun evaporation changes the color and flavor more than drying in an evaporator.

The moisture evaporated by heat is taken up and carried away by the atmosphere. In order that evaporation may be rapid and continuous, the moisture-laden air must be removed rapidly and continuously; that is, movement of air through the evaporator is essential.

The volume of air necessary depends upon two factors: the temperature of the air and its moisture content or "humidity." Each 27 degree Fahrenheit rise in temperature doubles the moisture-absorbing capacity of air—

for example, a given volume of air at 154 degrees Fahrenheit has about twice the moisture-absorbing power of the same amount of air at 127 degrees Fahrenheit. Air on a rainy or foggy day has less moisture-absorbing power than air on a dry summer day. This affects the volume of air that it is necessary to use. About 65,000 cubic feet of air falling 1 degree Fahrenheit will furnish enough heat to evaporate one pound of water, or 2600 cubic feet falling 25 degrees Fahrenheit will be necessary to accomplish the same result. The last figures are convenient as a rough measure of the amount of air necessary under average conditions because the air will in most grape evaporators enter the drying room at 145 degrees Fahrenheit to 150 degrees Fahrenheit and leave it at about 25 degrees Fahrenheit lower.

A large amount of heat is unavoidably lost during the operation. Some radiates from the walls of the evaporator; some is consumed in warming the fruit from outside temperatures to the temperature of the evaporator; but the largest loss is in the air leaving the evaporator. The extent of this last loss is shown by the fact that during summer the outside air, averaging, say, 80 degrees Fahrenheit enters the drying room at 145 degrees Fahrenheit and leaves it at 120 degrees Fahrenheit. The air is heated 65 degrees Fahrenheit, but only 25 degrees Fahrenheit of the added heat is used. Thus more than half of it is lost. Theoretically, we would be able to use the heat more completely if we permitted the air to become thoroughly saturated with moisture before leaving the drying room. Practically, this is not feasible, because the fruit gives up its moisture very slowly to air that is nearly saturated with moisture, and to obtain a reasonable rate of drying the air must be allowed to leave the evaporator only partially saturated. Tests reported by the Association of American Heating and Ventilating Engineers indicate that on the average only about 40 per cent of the heat furnished to the evaporator is actually utilized in evaporating moisture from the fruit.

Other things being equal, the rate of evaporation is proportional to the volume of air passing through the evaporator and the temperature of the air. It is possible, however, to reach a point where the moisture in the interior of the fruit can not diffuse to the surface as rapidly as it is absorbed by the air. This results in drying out and hardening of the surface of the fruit, a condition termed "case hardening." This condition greatly slows up the drying process. It is not believed that grapes will exhibit this phenomenon except near the end of the drying period because their juicy nature will permit the rapid diffusion of moisture.

There is for all fruits and vegetables, when dry, or nearly dry, a temperature above which rapid deterioration takes place. For grapes of the Sultanina variety, this temperature has been found to be about 145 degrees Farenheit, and it is believed that wine grapes are no more resistant; 145 degrees Farenheit is a very much lower temperature than is used for vegetables, or even for prunes.

PRUNING METHODS; OLD AND NEW

By Leonard Coates

IF it be admitted that the method of pruning deciduous fruit trees advised by Dr. J. C. Whitten and his assistants of the college of agriculture will increase production so that "the average yield of the trees pruned is said to be about four times as great as that of trees of the same age pruned in the old way," the questions arise: "How will the size and quality of such fruit be affected?" "How will the soil, already claimed to be overstrained, stand this extra demand upon it?" "What will be the increased cost of thinning to those who desire only a fair crop if the quality is right?" "How will the Prune and Apricot Growers' Inc. be able to handle four times as many prunes as are already predicted as a crop in the near future?" These, and other questions naturally suggest themselves.

Amongst the many evils to be corrected in California orchards, perhaps the greatest is that of overcropping. Is there an orchardist in the state who yet has been able to get his fruit properly thinned? This may not apply to prunes, although I doubt the ability of the average prune orchard to properly mature four times or even twice as much as it is accustomed to do. The complaint of packers has been for years that fruit is running too small, and many apricot growers are asking the association if they may not dry their fruit whole as it is too small to cut. Will not the new and admirable standardization laws object when smaller fruit is shipped East, and how will this be avoided if the trees are going to be coaxed into much heavier bearing?

California's climate, or climates, conduce to heavy and regular yields of fruit, but it is true that adverse weather conditions occur and are much more noticeable now that there are hundreds of thousands of bearing acres instead of thousands, besides the ever increasing list of insect pests which play havoc to the extent of many hundreds of millions of dollars annually on farm products generally.

Quality is better and pays better than quantity; as a broad proposition, you can not have both. The progressive grower, shipper and packer has been advocating this for years.

Pruning has for its object the limitation of production as much as its extension, although it must be admitted that a promised increase is most alluring with present prices in view. In Europe, especially in Great Britain and Northern Europe, the whole art of the gardener and of the orchardist is used to increase production, even to the extent of periodically "lifting" the tree and pruning its roots, and by "pinching" the growing shoots throughout the summer season.

MAKER TO YOU—PAY WHEN PLEASED

—and I pay the freight! Simply write me to send you two or more of the

SECURITY KANT-WOBBLE LADDER

Send no money with your order. I will ship ladders to you freight prepaid—you look them over, examine that famous light, steel cuff-bracket that does away with all wobble, see the practical scientific way the SECURITY is made, note the wide spread, vertical grain wood, light weight, sturdy strength—then you send me the money. If you don't like the ladders send them back,—but not one shipment has ever been returned as yet. When progressive orchardists see the SECURITY they know it's the one ladder they want in their orchards.

The prices: 8-ft. ladder, $5.00; 10-ft. ladder, $6.00; 12-ft. ladder, $7.20.

Act quick—send me your order today.

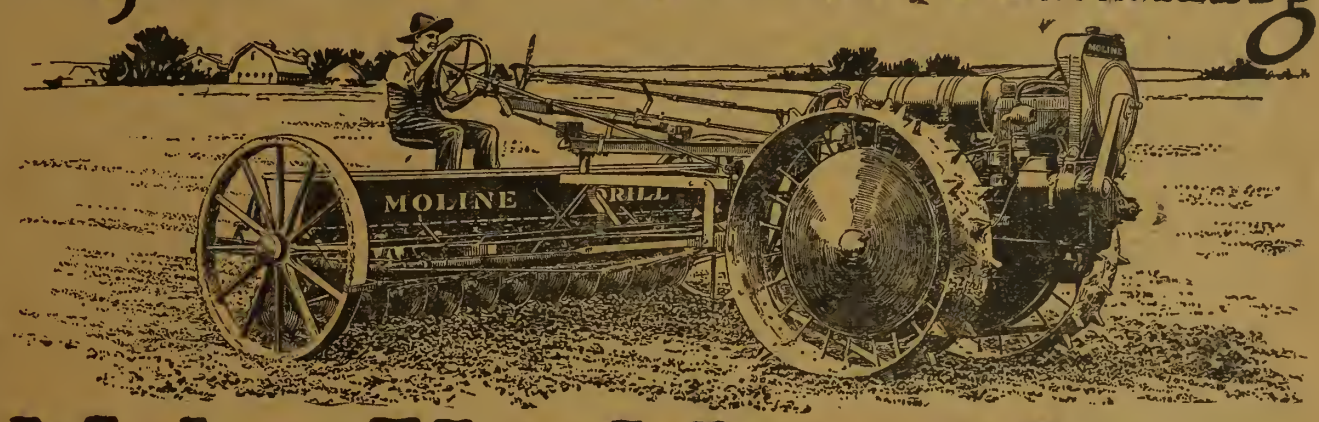
MOLINE

System of Power Farming



Makes You More Money With Less Hard Work

Thousands of Moline Power Farmers in all parts of the country are making more money with less hard work. They are getting more profit and enjoyment from farming, and you can do the same by using the Moline System of Power Farming.

With the Moline-Universal Tractor and Moline Tractor Implements, you can do all farm work, including cultivating, faster, better and cheaper than you ever did before. You can eliminate practically all your horses for field work. And one man operates both tractor and implement from the seat of the implement.

Read what the Moline-Universal Tractor has done for the following Moline Power Farmers:

"Put the farm on a paying basis." L. Bonnett, Farson, Iowa.

"It has made farming easier and a pleasure." Fahy Nisuonger, Sidney, Ohio.

"Real satisfaction and enjoyment in farming." Logan L. Howard, Erick, Okla.

"It has made it possible for one man to do the work of two and sometimes three men. I can plow twice as much as I can with five horses and gang-plow." Frank S. Wales, Polo, Ill.

"Makes farm life more pleasant." S. P. Smith. Lovington, Ill.

"Makes farm work more enjoyable. Does away with high feed prices and shortage of labor." Zimmermen Bros., Earlville, Ill.

"It has placed me above my neighbors, who do not use the Moline-Universal Tractor, for efficient and economical farming." J. C. Felts, Winfield, Kans.

"Makes farm work much easier. Gives longer time for rest between jobs, and does not take long to do a big amount of work." J. W. Henry, LeRoy, Kans.

"Solved the farm labor problem. Makes farm work more attractive to our boys." D. N. Foster & Son, Seymour, Ind

"The Moline-Universal Tractor is a wonder." L. J. Wold, Vermillion, S. D.

"It has done everything I have undertaken with satisfactory results." Wm. O. Mistele, Kendall, Wis.

the Union, apart from those on the Pacific slope, frequently have partial to total failures of crops, those providing a rest for both tree and soil. Such trees should be better able to carry very heavy crops in years when weather conditions are favorable, but California's fruit trees are usually expected to do full duty every year, and generally fulfil these expectations.

PREPARING THE SURFACE FOR PAINTING

It is common practice when we do an odd job of painting around the home to simply apply the paint without thought in regard to the surface for foundation. It is just as important that the surface be in good condition as it is that we select a good grade of paint, for no matter how good the paint the result will be far from satisfactory if some attention is not given to this detail.

In the first place, the surface to be painted must be clean, dry and free from dust, grease and dirt. On new work, a thin coat of shellac should be applied to all knots and sappy places. On work that has been previously painted, use a wire brush to remove all loose particles, and spots that are entirely bare where the paint has chipped off should be given priming coat of paint reduced with turpentine.

The extra labor in thus properly preparing the surface will be more than justified in the durability of the paint coat and the smooth, uniform appearance of tho finished surface.

This Month in the Vegetable Garden

Northern California

By A. R. Gould

REAPING the harvest of one's labor is the most encouraging part of work in the garden. Besides being profitable it can also be interesting if a record of planting events has been kept; and it should be possible to refer to data throughout the year. Such a system will lead to increased interest and greater results. Our record should show condition of soil when crop was planted, quantity of seed used, with or without manure, when and how cultivated, weather conditions and full details of yield. This information will prove to be invaluable for all future work as by it one can best judge if the results have been worth while. Trouble from insect and fungoid pests should also be carefully recorded and methods of control adopted. Investigation along these lines should be the duty of all who love garden work as there is always something new to learn. This month many important crops may be dug and stored ready for further use, and every care should be exercised while digging these up so that they are not bruised, and any root crops so damaged or found diseased should be thrown out and not stored with the rest. Store in dry sand or earth in a cool, dark place such crops as turnips, beets, carrots and potatoes. Clear as much ground as possible and never leave these root crops in after they have reached maturity as they will start a secondary growth and become tough and useless, besides wasting the ground which can be used for further production.

Tomatoes

There are already signs of a good crop and the vines are still in very active growth. Where they are being grown on the single stem or trained system all side growth or axil shoots should be kept pinched out. To assist pollination the plants should be kept free from heavy overhead watering and it is advisable to gently shake the branches during the middle of the day.

Beans

Keep this crop picked off as the green pod or golden wax become ready for table as it will help the vines to produce larger crops. On ground cleared from root crops sow stringless green pod and golden wax, and the plots sown last month should be watered and the cultivator kept busy. Collect all dry beans from early crops and store these in a dry place for winter use. If required for seed keep the varieties together and have them of selected type.

Corn

Any cobs of the desired type required for seed saving should be marked and harvested when properly ripe. Early plots should be cleared off and prepared for planting up to other crops in the fall. A sowing of the early Golden Bantam may still be made. Corn sown last month should be well cultivated especially after irrigation. Apply dry arsenate of lead to the silks, of any ears as they develop to prevent the corn worm.

Lettuce

Sow May King and Big Boston or Iceberg for late summer and fall supply. Sow thinly in rows and thin out to eight inches apart or it may be sown on a seed border and shaded from the hot sun during the day.

Brussels Sprouts and Kale

At the end of the month seedling plants of these sown last month may be planted out on richly prepared soil

Cabbage and Cauliflower

Seeds of these should be sown thi month. Sow Early Snowball cauliflower on a border of well prepared soil or in boxes and Autumn Kin cabbage.

Leeks and Celery

There is still time to plant ou strong healthy plants you might s cure from your nurseryman. Thos previously planted should be well w tered and at the end of the month a application of artificial or liquid m nure may be given. Soot may also b applied very liberally.

Onions

This crop will be ready to harve this month, and after the tops hav dried off they should be ready to pu This is always a sure indication. Th bulbs should be well dried off in th sun before being stored away.

Potatoes

If the tops of these have beco yellow the tubers may be dug up, fact the main crop should be rea this month to store away. Lat crops should be irrigated once t month and hoed.

Turnips

Sow White Egg and Purple Top A erdeen for fall and winter use.

Southern California

By D. F. Reichard

THIS is the time that we get ahead of our Eastern friends. During August and for a couple months to follow we of California make garden for our crops of fresh winter vegetables. August starts our second spring.

Where early crops have matured clean up the ground and give it a thorough soaking. Plow or spade it deeply and pulverize it well. Then about a week before you wish to plant soak up your land again and work it over, putting it in shape to properly receive the seed or young plan All this irrigating is to take the pl of the rains we don't get.

Your plantings should follow t second working of the soil as clos as possible so as to take advantag the moisture which so readily osca during these warm days. In the c of seeds they should be planted ab twice as deep at this season as w planted in the early spring bec the surface dries out so much quic

at this time. For the looks of the garden as well as the ease with which it can be handled plant stuff in neat, regularly spaced rows.

Many of our vegetables like beets, carrots, turnips and parsnips are better grown in the fall and winter months than at any other time of the year. The cool months in which they mature give them better flavor and they have better keeping qualities than spring grown stuff.

Cabbage and cauliflower are best when grown during cool weather. Plant the seed now for crop to come off during January and February.

The first part of August is the time to plant fall potatoes. Those in at this time mature during cool weather and keep in good shape through the winter and spring. For fall plantings about 50 per cent more seed is required for a given piece of ground than is necessary for the spring planting. That is to say, it will take about 1000 pounds of seed potatoes to plant an acre now as compared to 600 pounds in the spring.

In the sections of late frost many of the regular summer vegetables may be planted during August with safety and profit.

The fall planting of peas starts this month. Be sure to have the ground well wet and prepare for irrigating every week until the weather cools. For successions, plant lettuce, radish, kale, parsley, Swiss chard, beet, carrot, turnip, salsify and onion. All of these should be drilled in rows 12 to 20 inches apart where they are to grow to maturity. Thin out the young plants when a few weeks old so that they will not crowd each other. With peas, beans, corn and potatoes it is better to plant in hills where they are to grow with rows 30 to 36 inches apart. Cucumber, summer squash and melons should be planted four to six feet apart.

Watch for insect and fungous attacks. Red spider and mildew are liable to be bad at this time. A liberal dusting of sulphur will control the spider while lime sulphur solution or Bordeaux mixture will eradicate the fungus.

Questions and Answers

ANSWERS BY EDITOR AND STAFF

Questions to be answered in this department should be received at the office one week before reply is expected. Write plainly on one side of the paper and sign full name and address. Unsigned communications receive no attention.

Summer Wilt of Tomatoes

Am sending part of a tomato plant. Its leaves suddenly wilted as have others in the same field. They have been well irrigated and can see no cause for the trouble.—Subscriber, Big Pine.

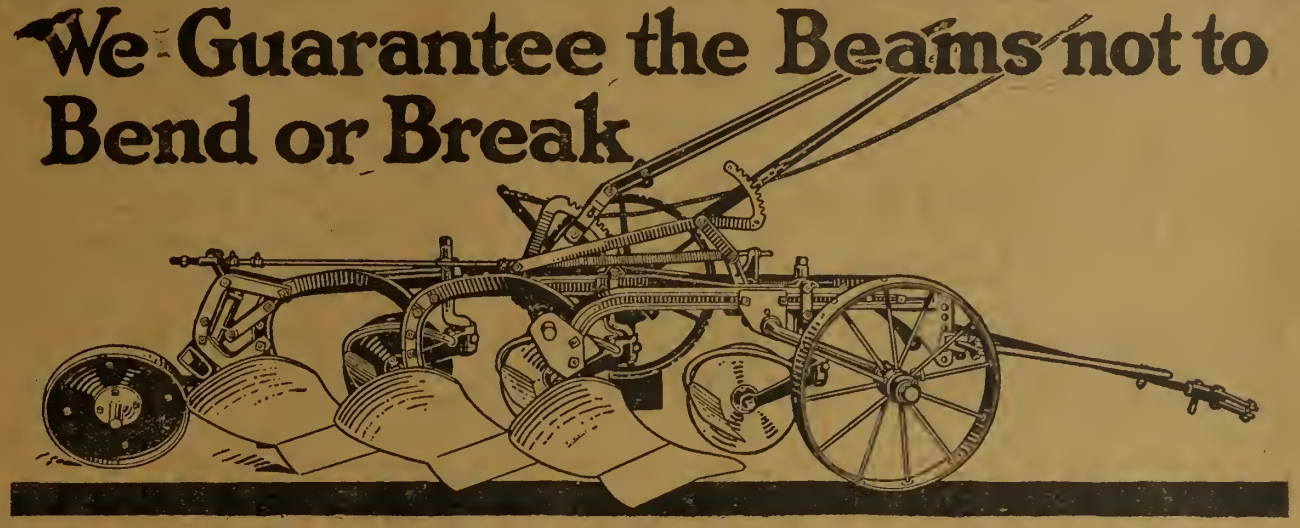
This is plainly fusariun or summer blight of the tomato. There is no saving of the plant which has become affected. Sometimes an entire field is destroyed by this pest. About the only procedure is to remove and burn at once any plant as soon as it shows that it is affected with the blight. Care should be taken to secure disease free plants and place in soil free from the disease. In fact the selection of the seed should be done with an idea of securing the seed from disease free plants. Write University of California, Berkeley, and ask for Bulletin No. 239 "Culture of Tomatoes in California". This gives photographs showing the appearance of the plants so that every tomato grower may quickly locate the cause of the trouble.

Spineless Cactus to Dairy Cow

Will the feeding of spineless cactus dry up a cow? I have been told that it will. Would like to hear from someone who has had experience in that line.—Subscriber, Redlands.

We pass this on to subscribers who have had experience. However we think it may depend largely upon the other feeds supplied. If the spineless cactus is fed with the idea that it will sustain life and supply all milk making feed, the cow will certainly decrease in flow. Analysis shows the feeding value of cactus to be extremely low, lower even than pie melons and with not one-half the milk producing value of mangels, pumpkins and similar feeds. If, however, these feeds are used simply to supply succulency and as appetizers, with sufficient alfalfa hay and possibly a concentrate, there is no reason why they should not induce increased milk flow. Alfalfa hay contains five times as much protein as does spineless cactus.

We Guarantee the Beams not to Bend or Break



-And There's no Time Limit to This Guarantee

WHEN you buy a John Deere Tractor Plow you get full protection against beams bending or breaking *throughout the long life of the plow.* You are protected by the material in the beams—extra strong, special John Deere steel. You are protected by the simple, binding guarantee of the maker of John Deere Plows. That is one of the many special reasons why you should choose a

JOHN DEERE TRACTOR PLOW

Remember—

Genuine John Deere Bottoms—the kind you get when you buy a John Deere Tractor Plow—have a world-wide reputation for good seed beds, good scouring and long wear.

John Deere Quick Detachable Shares—the kind you get when you buy a John Deere Tractor Plow—wear exceptionally well and are easy to keep close-fitting. Loosen one nut to remove the share; tighten the same nut and the share is on *tight.*

Sizes—
Two-Bottom
Three-Bottom
Four-Bottom

Remember, a tractor plow in operation is subject to hard strains. The tractor does not "give," as horses do. If a beam springs, the plow will no longer do good work. That means a costly delay while the beam is being repaired. If a beam breaks there is a costly delay and the expense of a new beam besides.

The extra strong, guaranteed John Deere beams protect you against delay and expense.

Be sure to consider that important feature when you choose your tractor plow. And keep in mind these other features:

The extra strong beam braces are long lapped and securely joined to the beams with heavy bolts and lock washers. The frame stays rigid. The bottoms keep their proper alignment.

The simple, strong, positive power lift is trouble proof. It doesn't gather trash. Its few parts move only when the bottoms are being raised. There is practically no wear.

In every way you will find that the John Deere Tractor Plow has the downright quality to enable it to keep on doing the best of work year after year with fewest repairs.

You can hitch this plow to any standard tractor. Your John Deere deale can furnish it to you in two, three or four bottom sizes. You can get it equipped with the type of genuine John Deere bottoms especially adapted to meet your requirements. See your John Deere dealer the first time you are in your town. Write to us for a folder. Ask for folder TP-14.

The Record of Production for Grade Cows

By C. V. Castle, University of California

IN starting this record of production the University of California feels that there is a need for this work and that it may be a great help to the dairy industry in a large portion of this state.

Never before has dairying been so profitable and never has the price of grade cows been so high, yet the price of many a grade cow might have been doubled and that of her heifer calf also if she had had an authentic certificate of production, showing just how good a cow she was. At one recent public auction in this state heifers from a grade cow, that had been the leading grade cow in the recent California State Dairy Cow Competition, sold for more than twice the price of heifers that looked just as promising but whose dams had nothing to show for their production.

It is up hill business to build up a dairy herd from cows bought on the market with nothing to show their value, while if it were possible to buy cows that you knew were producers, or heifers from such cows, and breed them to a pure bred bull with production back of him, it would be a simple matter to build up a profitable herd.

The issuing of a certificate to a cow will increase the care and feed given to her by the ordinary farmer. It will stimulate the work of cow testing in general because the cows with certificates, and daughters of such cows, will be in demand, and farmers who have never had their cows tested will become interested and begin to join the cow testing associations.

This work would be complementary to the work of the cow testing associations. The ordinary association has not the time to issue certificates to the eligible cows in its membership and, besides, it is felt that the certificate would mean more and have more value if issued under the supervision of the University of California.

Following are the rules and regulations under which the work is proposed to be carried on. Changes may be required from time to time, but they seem to provide the necessary machinery for carrying on the work at the present time.

RULES AND REGULATIONS

1. The work of collecting the records and issuing the certificates to be done by the University of California in cooperation with the various California cow-testing associations, nothing herein saying that other methods may not be also approved.

2. The University of California to have absolute authority in questions as to eligibility of cows, authenticity of records, etc.

3. A fee of $1.00 to be paid upon application for entry of any cow, to cover cost of supervision, forms and certificates.

4. On completion of a ten month record period the University of California will issue a certificate of record of production for cows that have qualified for the record.

Keeping of Records

1. The herd records as compiled by the various cow testing associations are to be accepted as authentic and correct, but the University of California is to be the final judge in all questions arising.

2. Any certificate secured by fraud or misrepresentation to be cancelled if the evidence warrants.

3. The cow tester or owner of cow to send in to University Farm, upon application, a detailed description of the cow, upon blanks to be supplied for this purpose by the University of California.

4. At each monthly test the testor or owner of the cow shall mail to the University Farm a report of the milk production and fat test of the cow for the testing day, on a blank form furnished by the University of California.

5. At the end of a lactation period of ten months a summary is to be sent to the University farm on blanks provided for that purpose, of the production of the cow, which will be compared to the monthly reports already sent in.

Eligibility of Cows

1. Until January 1, 1922, cows may be eligible that are of either grade or "scrub" breeding. After January 1, 1922, only cows that have been sired by a registered pure bred dairy bull will be accepted.

2. To qualify for a certificate, cows with first calf and under three years of age at the time of freshening must produce in ten consecutive months a minimum of 300 pounds of butter fat.

3. Cows with second calf or more must produce a minimum of 350 pounds of butter fat in ten consecutive months.

4. In addition to the fat production, a cow to qualify for the certificate must carry calf at least five months of the ten-month period.

5. Any cow that is known to have tuberculosis will not be able to qualify for a certificate.

6. To be allowed to continue on the test, any cow in normal condition must produce a minimum of 30 pounds of fat, for cows with first calves, and 40 pounds of fat, for older cows, during the first month of the test.

7. The owner of cows to be entered shall agree not to use or dispose of their male offspring for breeding purposes.

Eastern and Western Duroc Herds

By R. K. Walker

I have just returned from a trip to the leading Duroc-Jersey herds of the Middle-West and thought Cultivator readers might be interested to know of conditions there.

My first stop was at W. M. Putman & Sons at Tecumseh, Nebraska. They own the boar, Great Pathfinder, the best son of Pathfinder. This boar is a giant, being 86 inches long from between the eyes to root of tail. He is 42½ inches tall and has full ten inch bone. He is one of the great sow sires the breed has produced. Putmans also own Demonstrator, a great Col.-bred senior yearling. He will be at the National Swine Show. Great Pathfinder is a half brother to my grand champion sow, Cherry Blossom.

John Bader has some great pigs sired by Great Orion Sensation, the boar he sold to Ed Kern. Kern says he will not take $40,000 for this fellow. I believe he is the largest senior yearling in the world and he is one of the best of any age. The Sensation-Orion cross, of which this boar is a representative, is the most popular breeding in the hog belt states today. The Sensations give the size, feet and legs and the Orions add finish and type. Ed Kern owns both Great Sensation and Great Orion Sensation, and they are a wonderful pair. Fifty sows bred to or sired by Great Sensation sold in his fall sale for $102 each. Mr. Lelsey of Wisner, Nebraska, asked me $15,000 for a fall boar sired by Great Orion Sensation. He was the best boar of his age I saw on my trip.

Dan Kane at Wisner, Nebraska, has one of the giants of the breed in Mammoth Sensation, the breed's largest boar for his age.

I was very much pleased with the sows I saw at Hanks & Bishops sired by Pathfinder, in fact Pathfinder sows seemed to have a habit of being outstanding wherever I saw them.

I visited a large number of other breeders and saw some hogs I would like to see on the Pacific Coast. I will say also that I have seen a lot of hogs on the Coast that would look well in the best herds of the Middle West. I think the Pacific Coast herds of Durocs stack up very favorably with those I visited. We of course do not have the numbers of real outstanding animals in any one herd that are to be found in some of the best Eastern herds, but almost every well established herd I know out here has a few that would look well in any company.

It is a safe prediction, that in a few

Beef Cattle Specialist

For 30 years I have been devoting my entire time to pure bred beef cattle. I know the kind of cattle California needs and where and how to buy. I make regular trips to the great producing centers and will buy on order. Best of references. Satisfaction assured. Correspondence invited.

R. M. DUNLAP, Hotel Land, Sacramento, Cal.

years California breeders will be able to carry off the honors at the National Swine Show. We have the climate to grow pigs the year around and the breeders are bringing out better foundation stock from the East every year. I believe our Western breeders are more alive and up to date than the corn belt farmers. The fairs this fall will bring out the improvement that has been made in Western Durocs the last 12 months. I expect to see the greatest Duroc-Jersey shows ever held west of the Rocky Mountains.

SACRAMENTO-YOLO COW TESTING

The Sacramento-Yolo Cow Testing Association has continued its good work. The report for June shows prize won for herd average for the month by A. Krull. The average monthly fat production of this herd was 44.1 pounds, average butter fat test, 6.34; daily production from average cow, 23.2 pounds of milk. Another herd materially increased this total milk production, giving 37.8 pounds of milk, but its average butter fat was only 3.17, or exactly one-half the butter fat test of Mr. Krull's herd. The lowest record for monthly fat was 18 pounds. There were 42 cows that produced over 50 pounds of butter. The highest producing cow was the property of F. W. Kiesel, producing 78 pounds fat.

OLDEST COW TESTING ASSOCIATIONS

Humboldt County has two of the oldest cow testing associations of the state and they have been the cause of the material uplift of the dairy industry of that county. One of these associations has a membership of 1377 cows with an average production of fat in the month of June of 41.65 pounds. The average of the best herd in the association was 52.99 pounds; the average of the lowest herd, 29.40. The best cow in the association produced 87.45 pounds fat and the association had two cows producing over 80 pounds, 11 producing over 70, 79 over 60, 271 over 50.

Another association in the same county has 1390 members. Its average butter fat this year is almost identical with that of the first, 41.62 pounds. The average of its best herd was higher, however, showing 56.70 pounds of fat. The lowest herd produced an average of 33.80. The best cow produced 88.61 pounds. This was the only cow over 80 pounds, but there were 19 producing over 70 pounds, 62 producing over 60 pounds and 180 over 50.

CONTRA COSTA COWS

Statement of the high producing cows of the Contra Costa Cow Testing Association is made by Prof. Woll who is in charge of cow testing associations.

Contra Costa County cows to the number of 15 have had their names inscribed on the honor roll because of having produced 55 pounds of butter fat. The highest producing cow in this county during the month of June was a pure bred Holstein with a record for the month of 70.83 pounds of fat. Her milk production for the month was 2361 pounds. While her percentage of fat was much lower than that of any other cow which secured entrance to the honor roll her enormous production still made her the leader. Other cows on the honor roll belonged to Durroughs Brothers, E. H. Fox, E. Emerson, M. W. Hotchkiss and J. M. Christien.

ALAMEDA COW TESTING ASSOCIATION

Prof. F. W. Woll of the University Farm sends outline as to some of the performances of the cows, members of the Alameda County Cow Testing Association. There are ten cows which gave above 55 pounds butter fat during the month of June. Eight of these were in the dairy of F. Stenzel. The highest producer for the month was in this herd and gave 69.36 pounds of fat. The Koopman dairy has two cows in the honor class. The best of these came close to Mr. Stenzel's record maker, producing 66.08 pounds fat.

Duroc-Jersey Hogs

250——Spring Pigs——250

That have been mated with extreme care and properly raised and fed. The big, tall, rangy, high-backed, big-framed kind that can carry an awful load of pork and walk off with it. We have on our Orland ranch, the sires and dams of the $1100 sow and $1000 boar recently sold at San Jose Sale. WHEN YOU NEED GOOD DUROCS—WRITE US.

Secure Profitable Berkshires

We say profitable Berkshires because we have thoroughly demonstrated on our farm that our Berkshires are profitable. We have assisted many farmers in starting a herd and they are making money. AMES RIVAL 70TH, the Grand champion of 1918 and five other boars equally as well bred do service in our breeding herd.
JUST NOW we are fortunately situated and can offer you young animals or bred sows and gilts. The price we are asking will afford you a profitable investment. Can furnish one animal or a foundation herd. Write us and we will send you full particulars.

MILLS BERKSHIRE FARM
Hamilton City, Calif.

ANCHORAGE FARM BERKSHIRES ARE PROFITABLE

Future Champions Can Be Secured NOW

by placing your order for a young Berkshire boar from the famous Anchorage Farm herd. Star Leader and several of his sons have been mated with our large type Berkshire sows. Star Leader is famous wherever good Berkshires are known.
One of these young boars will not only add size and vigor but will add the quick maturing qualities demanded by pork producers.
Write immediately for full particulars and breeding and secure your future herd boar. Priced within reason.

Besgrade Dairy Food

Comes to you labeled with a tag showing analysis and ingredients.

Our cards are on the table, ***Besgrade Dairy Food*** is an open book.

When you buy ***Besgrade Dairy Food*** you know just exactly what ***ingredients*** go to make it. You know its analysis and that it is scientifically balanced to produce milk and at the same time maintain the cow's body reserve for heavy milk yield all the year, not for only a short period.

We build our feeds on a scientific basis and are willing to stand by results. What the dairyman wants is the best result per dollar obtainable—***and we guarantee it.***

We have prepared a pamphlet giving the name of every ingredient used in its manufacture, the analysis of it and why you cannot afford to make it yourself. Clip the coupon and mail. A copy of this pamphlet, also a copy of the new feed law, will be mailed to you immediately.

Besgrade Dairy Food not carrying this new tag has been manufactured previous to this date, but analysis is the same as shown on tag or in pamphlet.

August 20. W. M. Carruthers, Live Oak.

Duroc-Jersey Swine

August 19, Jersey Queen Farm, San Jose.

T. T. Miller of Hollister has sold the two year old Shorthorn bull, Matchless Elite, to Thornton S. Glide of Davis. Matchless Elite was sired by White Gloster and his dam was Matchless E. He stood second as a junior yearling at the Liberty Fair at Los Angeles last December.

The Adams interests of Oakdale were on the Kansas City market July 22 with 424 head of steers. Two hundred and thirteen, averaging near 1100 pounds, sold for $13.25 and 211 of about the same weight sold for $13.00. On the same day, 40 California raised steers that had been on Kansas grass sold for $15.

The Western Berkshire Congress will hold a donation sale at Sacramento during the state fair. The purpose of the sale is to raise sufficient money to cover the special premiums offered by the association at the California State Fair, the Los Angeles Livestock Show and the California International Livestock Show to be held at San Francisco. Frank B. Anderson, secretary, states that the association will probably offer a total of $750 at the three shows.

It is doubtful if any California hog sale has attracted wider interest than the Francis T. Underhill sale of Hampshires to be held at Santa Barbara Wednesday, August 6. Thomas Dinsmore, who is managing the event, states that he has received word that a number of prominent Eastern breeders plan to attend the sale in company with E. C. Stone, secretary of the association
During the morning of the sale the California Hampshire Breeders' Association will be organized. The meeting will be followed by a big barbecue and the sale will start at 1 o'clock.

Dr. L. J. Belknap, proprietor of the Jersey Queen Farm, San Jose, has claimed Tuesday, August 19 as the date for his sale of Duroc-Jersey hogs and Shropshire sheep. Dr. Belknap held a very successful Duroc sale early last spring.

W. M. Carruthers, Live Oak, has decided to change the date claimed for his public sale of Berkshires from August 20 to August 23. The change was made necessary on account of the arrival of the Pacific Fleet. On the above date Carruthers will offer around 65 head of high class boars, bred sows and gilts.

Professor J. I. Thompson of the animal husbandry department of the University of California has been notified by Secretary Carmichael he has been selected to judge Berkshire swine at the National Swine Show to be held at Des Moines, Iowa, September 29 to October 4. It has been rumored that Thompson will be asked to judge Berkshires at the International Live Stock Exposition to be held in Chicago.

Andy Simpson, herdsman for Edward Cebrian, arrived in Sacramento last week with the three Shorthorn herd bulls purchased in the East by Cebrian. As noted in these columns in a recent issue, Cebrian purchased from Anoka Farms, Waukesha, Wisconsin, the great imported bull, Caledonia at a price that is said to be the highest ever paid by a California breeder for a bull of any breed. He also secured the Canadian bull, Gainford Matchless. Simpson says that he was particularly impressed with the character of calves sired by this bull. The acquisition of two bulls of such recognized merit places the Cebrian herd in a very commanding position and will serve to strengthen the Shorthorn interest of the entire West.

Alex Benjestorf, superintendent of the Hollow Hill Farm, Colton, has recently returned from an extended trip through the East where he went to buy Guernsey cattle. Eighteen head were purchased and include 14 mature cows, one yearling heifer and three heifer calves. One of the mature cows, Lady Rilma, is a half sister to Azucena's Pride 2d, that holds the record in the three year old class with 16,203 pounds of milk and 855.7 pounds of fat in 12 months. Lady Rilma is a daughter of Ledyard Boy. The cows are bred to some of the most noted of the Eastern bulls, including Ne Plus Ultra 4th, half brother to the two bulls sold recently for $25,000 and $14,500. Several of the cows are bred to Pencoyd Secret Premier, a bull that traces nine times the great old cow, May Rose 2d. The Hollow Hill herd is considered one of the top collections of Guernseys in Southern California.

Following their established custom, the Kings County Poland-China Breeders' Association will hold their annual fall consignment sale at Hanford October 11. As usual, the sale will be held in the sales pavilion at the fair grounds and will consist of 80 bred sows and gilts. The association is one of the most active of any of the state livestock organizations. The sale will have the active support of all the members and the following breeders will consign: M. Bassett; J. A. Crawshaw; Wm. Bernstein; John Bernstein; G. I. McCune; G. Nehls; C. L. Newport & Son; H. E. McMahan; T. J. Woodworth; W. L. Haag & Son; R. G. Hamblin; H. McCune; R. Waltz; C. A. Vaughn; W. T. Dice; W. S. Hubbard & Son; C. G. DeRaad; Dimmick Brothers; W. D. Trewitt; E. G. Meyers and F. D. Ross.

H. D. McCune, Lemoore, who breeds Poland-Chinas, will have his show herd at the state fair headed by his senior herd boar, Kings Massive Orange. In the herd will be found an exceptionally good senior boar pig, McCune's Buster, by Giant Buster. His son Earl who will have several entries in the junior and senior pig classes is particularly well pleased with a litter by Surprise Prospect and from a sow that he purchased early in the spring at the Grover Sampson sale in Missouri. Another member of the Mc-

Harvest Beans with a DAVENPORT RIDING BEAN HARVESTER

Our strongly constructed two-row Riding Bean Harvester is the result of many years experience in California bean fields. Blades are 6 inches wide of plow steel, frame very strongly braced. Both lumber and steel are going up. The next lot manufactured will cost more. Buy early.

BERKELEY, CALIF.

Cune family, Miss Marie, had two entries in the Lemoore High School pig club sale, one sold for $220 and the other for $100.

Since his sale held last April Wm. Bernstein of Hanford has added a number of very high class Poland-Chinas to his herd. Among the recent arrivals at the ranch is a son of Black Prince, the grand champion at the 1918 National Swine Show, and a sow by the same boar. A fall boar sired by the well known boar Big Ben has been purchased from an Illinois breeder. From R. A. Welch, Red Oak, Oklahoma, came a son of Chief's Defender's Choice, and from N. Hauk, Alton, he secured a young boar and four gilts. Mr. Bernstein is making his selections and laying his plans for a spring sale of strictly big type Polands that he hopes to make the most attractive of his career as a breeder.

W. T. Dice, who two years ago sold his farm and removed to Oregon, returned to Hanford early this spring and again entered the ranks of the Poland-China breeders. He has assembled a herd of about 80 head. In the sale which will be held at Hanford November 11, he will consign four sows of big type breeding. His show herd this fall will consist of senior and junior yearlings and senior pigs and will be seen at the state fair and the shows that follow.

Chas. L. Weaver of Tulare who breeds Milking Shorthorns and Poland-Chinas, recently purchased from Thomas Harrison of Santa Rosa the bull, North Star. North Star was sired by Brandsby's Coming Star, a first prize winner at the English Royal Show of 1910, and first in class at the London Dairy Show in 1911 and afterward sold for $4000 for export to the United States. The dam of the Weaver bull is the $3000 Blossom 23d, imported by the late James J. Hill. North Star will be seen at the head of the show herd at the state fair. Mr. Weaver states that A. D. Severe, a prominent Iowa Poland-China breeder who recently visited this state said that the boar, King Golden Gate by Golden Gate King was one of the best he had seen.

A recent arrival at the farm of Joe N. Chinowth, Visalia, breeder of Duroc-Jerseys, is a sow from the herd of F. O. Lord & Sons, Greentown, Indiana. She is by the noted Colonel Jack and out of a daughter of Jack's King Lady, one of Ira Jackson's foundation sows that is said to be one of the greatest sows the breed has produced. At the recent sale held by the Tulare County Duroc-Jersey Breeders' Association Mr. Chinowth not only made the highest average but topped the sale with Ohio Lady, sold for $300. Herd boars in service at the present time are Lord's Orion Cherry King and Joe's Orion Cherry King 5th.

At a meeting held July 22 the Tulare County Poland-China Breeders' Association made final arrangements for a sale to be held at Tulare October 21. The sale will be the first semi-annual sale of the association and will consist of 50 head, 42 of which will be bred sows and gilts, four open gilts and four boars. The following breeders are expected to consign: R. F. Guerin; Mrs. Z. Loslebin; W. E. Martin; G. B. Martin; Thos. Jacobs & Brother; J. H. Handschilt; John E. Clark; F. E. Fay; J. K. Macomber; Hugh C. Shinn; B. M. Hargis; A. J. Elliott and Chas. L. Weaver.

A daughter of Matador Segis Walker, one of the great Holstein sires at the head of Carnation Stock Farms herd, Seattle, Washington, sold recently at public auction in the East for $12,200. It will be remembered that two choicely bred heifers in calf to this bull were sold in the Guaranty Sale at Sacramento last March. One of them was purchased by Burr Farm, Los Angeles, and the other by H. J. Long, Mason, Nevada. The one owned by Burr Farm is now fresh with a nice heifer calf.

Judge Matador, a few months old son of Matador Hengerveld Bess the $12,200 daughter of Matador Segis Walker, sold for $7000 in an Eastern sale recently. He is sired by the famous Judge Segis, head of the big herd at Hollywod Farm, Hollywood, Washington. A granddaughter of Sir Skylark Ormsby Hengerveld bred to Judge Segis is owned by S. G. Kounias, Modesto.

Some excellent official records have recently been made in the good herd of registered Holsteins owned by Albert E. Smith, Sumas, Washington. Possibly the most remarkable one of them was made by a cow milking out of only two quarters. In seven days she made 31.36 pounds butter from 667.7 pounds milk, and in 30 days made 120.31 pounds butter from 2594.1 pounds milk. She is being continued on yearly test and A. W. Dahlquist, superintendent of Milky-Way Farm, believes that she is capable of making 1000 pounds butter even with her great handicap. Another good cow in the herd, Lady Aaggie Echo Hengerveld, has to her credit 30.5 pounds butter from 607 pounds milk the first seven days on test. There is a beautiful lot of daughters of Chimacum Spring Farm King Pontiac to freshen this summer and fall in Mr. Smith's herd and some good records may be looked for. It will be remembered that a daughter of this sire sold for $2600 in the March sale at Sacramento to Toyon Farm Association, and after freshening as a junior two year old she has made over 23 pounds butter in seven days.

Carnation Pauline Walker, owned by Carnation Stock Farms, Seattle, recently completed official records of 20.42 pounds butter from 445.4 pounds milk in seven days, freshening at the age of two years, one month. She is full sister to Matador Segis Pauline Jennie that made 29.91 pounds butter in seven days as a three year old.

Helena of Sunnyside, a junior two year old daughter of Sir Veeman Korndyke Pontiac, recently completed an official record of 20.32 pounds butter from 408 pounds milk in seven days in the herd of registered Holsteins owned by R. F. Guerin, Visalia. Mr. Guerin's herd is largely composed of daughters of this sire and they are an unusually promising lot. The bull himself is now at the head of Burr Farm herd, Los Angeles, where he is being mated with a large number of good cows.

The members of the Fresno County Poland-China Breeders' Association who are to hold a sale at Fresno, August 20 are looking forward to a splendid crowd. The request for catalogs has been very gratifying and covers a wide territory. Walter C. Ficklin, secretary of the association says that the committee that made the selections are more than pleased with the class of animals they were able to secure. Most of the offering represents such well known sires as Kings Big Bone Leader, grand champion at the 1918 California state fair; President; Jumbo's Equal; the great Bassett boar, Model Fellow and Young Jumbo. Catalogs are being mailed to all who make the request to Walter Ficklin. Col. Geo. W. Bell of Tulare will serve as the auctioneer.

J. H. Crawshaw, who, in conjunction with M. Bassett and Fred Ross will hold a sale of Poland-Chinas at Hanford, October 7, will offer 20 bred sows and gilts by California Gertsdale, a son of the famous $6600 Gertsdale Jones. The dams of these animals represent such popular blood lines as Story's A Wonder, Jumbo Equal, Longfellow Equal and Long Model. The gilts have been carefully grown out and will be bred to farrow at 15 to 16 months of age.

APPLETON Silo Filler

Better Silage *Pays*

It's the kind of silage that you make that really counts. The Appleton Silo Filler is *built* to make more appetizing and nourishing silage, because it *cuts clean and even*—no shredding. Every pound that goes into the Silo packs more firmly and airlessly, insuring a rich, succulent feed the year around, that makes stock thrive.

The wonderfully efficient, heavy, spiralled knives and adjustable cutter bar of the Appleton, are without an equal for delivering the even, cylinder-cut silage that insures 100% feed-value. The movable cutter bar enables you to adjust for clean-cutting under all conditions. The Appleton can be made to cut 10 lengths, from 5/16 to 2½ inches.

In addition to making better silage, the Appleton does *more work*, more safely, quickly and easily, *on less power*. Write for our free booklet, and learn all about the other Appleton advantages, such as: simple, strong operating construction; auxiliary web-feed and big throat that save labor and time in feeding; traveling feed-table on power-saving, frictionless rollers; safety device that minimizes danger and damage, etc. 4 sizes, for 6 h.p. and up. The Appleton copes with all farm conditions.

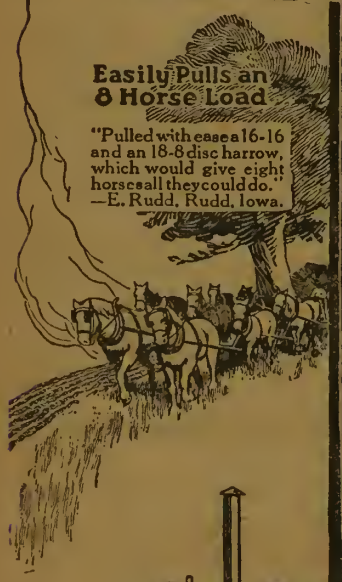
A Giant in Power
A Miser in Fuel

WATERLOO BOY
ORIGINAL KEROSENE TRACTOR



Easily Pulls an 8 Horse Load
"Pulled with ease a 16-16 and an 18-8 disc harrow, which would give eight horses all they could do." —E. Rudd, Rudd, Iowa.

Minimum loss of energy between motor and wheels is one of the distinctive construction principles to which this tractor owes its great power at low fuel cost. Power generated by motor goes direct to belt pulley, and to rims of hind wheels, giving greatest pulling leverage, relieving hubs and axles of all strain. It is transmitted through powerful steel gears, roller bearing, oil-floated, which reduces friction.

Complete Combustion of Kerosene

is the factor which contributes to low fuel consumption and trouble eliminating operation. In a 165-day test run to its full 25 H.P. capacity, the Waterloo Boy motor consumed an average of less than 1⅓ gallons kerosene per hour, without smoke or carbon deposit—no trouble from dirty spark plugs—full power from every drop.

Easy accessibility of dust-proof gears, dependable ignition, control by one lever and foot pedal, automobile type gear shifts, automatic lubrication, and other features combine to make this tractor efficient in unskilled hands.

Write us for illustrated catalog. It shows many views of farms where the Waterloo Boy is at work, with names and opinions of their owners.

The Keep On Register of Merit Jerseys

Selecting a herd sire is an important responsibility. Buy the best. Increase your production by buying a "Keep On" sire.

We offer one two-year-old, a direct grandson of Champion Flying Fox. Also one yearling—nothing better—from dams of great records. Write your wants. Prices reasonable

Dr. H. W. Hand **Orland, Calif.**

The Tulare County Poland-China breeders met in Tulare Tuesday, July 22 to make final arrangements for the holding of their first semi-annual consignment sale which will be held in the new sales pavilion Tulare, October 21.

The committee which was appointed to visit the various herds has selected 50 head from the following breeders: R. F. Guerin, eight; Mrs. Z. Losleben, one; W. E. Martin, ten; G. B. Martin, two; Thos. Jacobs & Brothers, five; J. H. Hauschildt, one; John E Clark Jr., one; F. E. Fay, five; J. K. Macomber, one; Hugh C. Shinn, eight; B. M. Hargis, two; A. J. Elliott, six; Chas. Weaver, one. The animals entered in the sale consist of 42 bred sows, four open gilts and four young boars.

Announcement is made that Senator Benj. F. Rush of Suisuin has purchased the well known white heifer, Lady Ruberta that was reported sold in the Carruthers' sale to a firm at Caldwell, Idaho. The Idaho buyer was not able to make a satisfactory settlement and as soon as Senator Rush learned of the fact he made an offer representing a substantial advance over the sale price and secured her for his own herd. He also purchased privately from Mr. Carruthers the red junior yearling bull, Victor Lad. Victor Lad was sired by the well known bull Maxwalton Rosedale and is out of a Victoria dam.

A. A. Jenkins, Tulare, breeder of Jersey cattle, and whose herd is considered the equal of any on the coast, recently sold to C. R. Sortor, Tulare, a young bull. This is the third bull Mr. Sortor has purchased from the Jenkins herd in the past four or five years. Twenty cows now in milk have returned from the sale of cream alone, an average of practically $25 per head for the past four months.

Poland-China breeders in San Joaquin County have organized the San Joaquin County Poland-China Breeders' Association. Practically every breeder in the county holds a membership. At the initial meeting held at Lodi, J. H. Lehman was elected president, and Sherwood Beckman was elected secretary-treasurer. Plans for a full sale were discussed and it was decided to hold a sale of boars and bred sows and gilts at Stockton on September 19. Col. Ord L. Leachman, who will handle the sale, states that it will be held at the fair grounds adjoining Stockton.

M. C. Allen of the Winsor Ranch, Bonita, is visiting the Jersey herds in the San Joaquin Valley with the view of purchasing a number of high class cows. Mr. Allen visited the Jenkins herd of Tulare and was greatly impressed with the quality and type of Jerseys found there. As the number of animals Mr. Jenkins was willing to let go was limited Mr. Allen is making quite an extensive trip to see if a sufficient number can be secured to establish the size herd he has in view. While in Tulare he attended the sale of Duroc-Jersey swine and was a liberal buyer.

H. H. Gable has been informed by Professor Gordon H. True, who recently judged at the annual Territorial Fair at Honolulu, that two young Hereford bulls purchased last spring from Gable's Diamond Bar herd stood first and second in class. Mr. Gable, who was the first president of the Pacific Coast Hereford Breeders' Association, has one of the leading herds of Herefords owned in this state and he has recently strengthened the herd by purchasing the outstanding bull, Don Perfect 4th. This bull made an enviable reputation in the Griffith herd in Iowa and was brought to California at a long price. He has been given wide service in the Diamond Bar herd the past spring and Hereford men are looking forward to his first crop of calves to be dropped next spring.

C. H. Walker, Kansas City, publisher of the Poland-China Journal, in a letter to Col. Geo. W. Bell, the auctioneer, writes that he is planning an extensive trip through California and hopes to meet every Poland-China breeder in the state. As a large number of public sales will be held during the month of October he has selected that month for his visit.

Geo. A. Stengle of Lark Meadow Ranch has sold a Superbus Masterpiece boar to C. N. Esender, chief dispatcher for the Salt Lake Railroad, who is developing a Berkshire ranch at Moapa, Nevada; also a fine bred gilt of same breeding to Frank M.

W. F. YOUNG, Inc., 244 Temple St., Springfield, Mass.

Holstein Herd Averages 18,812 pounds Milk

Near Big Bay, Mich., is a herd of thirteen pure bred Holsteins. Last year the average yield per cow of this herd was 18,812 pounds of milk and 638.57 of fat.

Do you realize the money there is in such cows? It is estimated that the average annual yield of all cows in this country is under 4000 pounds. These thirteen cows produced as much milk as sixty-two cows of the 4,000 pounds class. It would require twenty-eight cows giving 8,500 pounds to equal their output.

Rancho De Los Cuevitas

Breeders of D. S. Polled and Horned Herefords. Bulls, one to two years old; heifers, one to three years old; one to a carload for sale.

Herd headed by Variation 17th 447159 (3238), a Mossom Boyd bull that weighs more than 2200 pounds.

JOHN B. BOWMAN, McINTOSH, N. M.

Hinton, dairyman of Santa Fe Springs, Los Angeles County.

The Glenn County Shorthorn Cattle Breeders' Association was organized Friday, July 18, at Butte City. This is the first organization of the kind in California and one of the first in the West. Officers were elected as follows: President, W. S. Guilford; first vice-president, Col. D. A. Shelloe; second vice-president, Dr. T. T. Purkitt; third vice-president, Robt. McKee; fourth vice-president, Adolph Loshe; secretary, Ernest V. Eibe; treasurer, P. H. Green, cashier of the Bank of Willows; official veternarian Dr. L. E. Tuttle; inspector general, Chas. H. Glenn. Board of directors: O. L. Raper, chairman; Col. D. A. Shelloe; Dr. T. T. Purkitt; Curry French; Robt. McKee, Adolph Loshe; E. V. Eibe; L. E. Tuttle; Chas. H. Glenn; P. H. Green; W. S. Guilford; A. H. Culver; Henry Compton; Lee Logan; J E. Knight; August Henning Jr.; Chas. L. Lambert Jr.; J. M. Walters; W. P. Dwyer. A committee was appointed to arrange for space at the Glenn County fair at Orland in September and to arrange for the next meeting of the association at that fair —as follows: D. A. Shelloe, chairman, O. L. Raper, Ernest V. Eibe. Another committee to arrange with breeders to make an exhibit at the fair was named as follows: Dr. T. T. Purkitt, chairman; Henry Compton; Chas. Lambert Jr. Colonel Shelloe called attention to the fact that the breeders of Glenn County were under obligations to Butte City Ranch for the establishment of the large herd maintained there and for making it possible to secure stock of the highest quality without sending to the Eastern states for it. He predicted that within five years there would be dozens of herds of from 20 to 200 head of registered Shorthorns in Glenn County.

Walter R. Gatton, manager of swine department of the Diamond Bar Ranch, Spadra, states that they will have a complete show herd of their Duroc-Jerseys at all the leading shows on the coast and may possibly send a few to the National Swine Show, Des Moines, Iowa. Mr. Gatton recently returned from an extensive trip through the East where he purchased 70 sows and a few boars, making his selections from several of the leading Eastern herds. The sows purchased were by such noted boars as Pathfinder, Col. Gano, Orion Cherry King 5th, Creator and Great Wonder I Am. Included in the above shipment is a senior yearling litter mate to Great Orion Sensation and an under year sow by Pathfinder. He also secured Mammoth Sensation 2nd, by Mammoth Sensation, and Top Sensation Jr. by Top Sensation, two boars of the most popular blood lines, both of which will be seen at the shows. Mr. Gatton states that he will hold a public sale of bred sows shortly after the first of the year and will include in the offering some of the best animals on the ranch.

On September 30 at Hanford, Dimmick Brothers and C. H. DeRaad will hold a complete dispersal sale of Poland-Chinas. Dr. DeRaad, having sold his farm, is retiring from the business, while Dimmick Brothers are dissolving a partnership of several years, Oscar Dimmick removing to his farm recently purchased in another county. The entire herd of some 70 animals of DeRaad and Dimmick Brothers will be sold and include herd boars, young boars just ready for service, bred sows and gilts, open gilts and spring pigs It is to be regretted that these men are temporarily at least, retiring from the ranks of Poland-China breeders, as in their herds some of the best blood of big type Poland-Chinas is found.

Les McCracken of Ripon writes that on October 4 he and Hale I. Marsh of Modesto will hold a joint sale of Poland-China bred sows and gilts representing as choice bloodlines as California herds afford. A feature of the sale will be a goodly number of sows and gilts bred to King's Big Bone Leader, grand champion at the 1918 state fair. This boar is now owned by Mr. McCracken. The sale will be held at Modesto.

John A. Bunting, secretary of the Pacific Coast Hereford Breeders' Association, states that the association will hold a meeting at Sacramento during the week of the state fair, at which time plans will be completed for the sale to be held at San Francisco during the live stock show. Bunting states that the prospects are excellent for a big exhibit of Herefords at the fall shows.

R. M. Dunlap of Sacramento, one of the veteran cattlemen of this state, has just returned from an extended trip through the principal cattle sections of the Middle West. While East Dunlap selected over 100 head of registered Shorthorn and Herford bulls to be delivered early in November to California ranchers. Dunlap has made two trips East since the first of the year and expects to make at least three more during the next six months. He says that he has never known such widespread interest in better bulls as is being manifested by ranchers of this state.

Malcom H. Gardner, superintendent of Advanced Registry for the Holstein-Friesian Association, advises that the cow, Creampot Pontiac Korndyke has broken the record for fat production in the seven-day division by producing in seven consecutive days 795.9 pounds milk containing 40.561 pounds fat, with test still in progress on June 30. Computed on the 80 per cent basis, the production credited to Creampot Pontiac Korndyke to date is equivalent to—50.70 pounds butter. Her sire is Cedardale Pontiac Korndyke and her dam in Genesta De Kol Creampot.

J. Francis O'Connor, Santa Rosa, proprietor of the Castleview herd of Berkshires, recently sold to Jenkins Bros., of Indiana the sow Grand Lady Mayhews 4th. The sow was bred by A. B. Humphrey of Escalon and after winning the grand championship at the 1916 California State Fair was purchased at public auction by A. W. Foster for $600. She afterwards passed into the ownership of O'Connor. The deal was consummated by L. E. Frost, of the Berkshire World, during his recent visit to this state.

Owners of stock brands in Arizona, according to a law passed by the last legislature, are required to re-register them. The Secretary of the Livestock Sanitary Board, Ed. Stephens, states that the applications already received show "sufficient discrepancies to make the ownership of some brands a matter of doubt had it ever come to a court test. There are cases where a man's entire herd could have been taken away from him because he was innocently using a brand that legally belonged to some one else. Such matters as these will all be straightened out by the re-registration, and possibilities of future disputes obviated."

Fatten hogs on self-feeders as far as possible. Hogs fed in this way save labor, save feed in proportion to the gain in weight made, and are ready for market sooner than those which are hand fed. Less feed is actually required to fatten when hogs are self fed. The system is therefore economical in every respect.

R. L. English of Pasadena and Chino has recently purchased ten bred Hereford heifers from W. D. Johnson & Son, Kansas City, Missouri. Mr. English has been a very prominent exhibitor of saddle and show horses at Pacific Coast shows, and he plans to build one of the leading Hereford herds of the West.

John I. Cazier, Wells, Nevada, president of the Pacific Coast Hereford Breeders' Association, writes that he expects to show at the forthcoming state fair. Western Hereford men are hoping that they will have an opportunity to see Beau Blanchard 76th, the young bull purchased last spring by the Caziers for $10,000. This bull is the highest priced Hereford bull owned in Nevada or California and is regarded as one of the best sons of the noted Engle bull, Beau Blanchard. The Nevada Hereford Ranch, owned by the Cazier family, represents one of the leading herds of the West. Besides the above mentioned bull, they own Harris Standard 2d, a son of Standard and out of Disturber's Lassie, dam of the $35,000 Repeater's Model. They also own Debonair 64th and Nevada Lad 8th, both proven sires of the first order. Over 250 head of registered females are maintained. Cazier states that there is an encouraging development of interest on the part of range men for better bulls and that the quality of bulls demanded insures the future for many new breeding herds. They have recently sold to the Dumphrey Estate of Battle Mountain a carload of young bulls.

SANTA ANITA RANCHO

Anoakia Breeding Farm

Arabian-Thoroughbreds

Out of our choicest thoroughbred mares and sired by our famous imported stallion Ibn Mahruss we are offering some splendid two year olds. PURITY Purity BIOLOGICAL LABORATORIES First

Live Stock Profits

are directly dependent upon the general health of herds and flocks. Not all live stock diseases can be controlled or cured, a fact that justifies owners of live stock taking advantage of every proven method for eliminating possible risks.

Purity Biological Products
(not always cheapest but always best)
offer the greatest protection against certain diseases.

PURITY BLACKLEG AGGRESSIN—Germ Free Vaccine — produced by the Kansas method. One treatment immunizes for life. Being germ-free its use will not introduce blackleg into healthy herds. Over 1,500,000 calves vaccinated without loss.

PURITY ANTI-HOG CHOLERA SERUM is the most extensively used in the world

PURITY MIXED VACCINE FOR SWINE prevents Swine Plague and Necrotic Enteritis.

PURITY HEMORRHAGIC SEPTICEMIA VACCINES for cattle and sheep prevent Hemorrhagic Septicemia and reduce losses in infected herds.

We are prepared to offer the highest degree of service—service that counts, and does not end with selling. Correspondence and consultation invited. Write, wire or phone.

Only Bull Calves For Sale

HOW TO BUY A BULL

Senior Herd Sire

King Pontiac Netherland Segis 3d

We have 30 of his daughters in our herd, seven are on official test. At the average age of two years and two months, three of his daughters average better than 21 pounds. As a sire he is proving his ability to breed true to the best Holstein type.

In purchasing a herd bull these facts should be before you constantly: He should be from a high producing dam—the higher the better. He should be sired by a bull that is a known sire of merit. He should combine high producing blood lines with the most approved breed type.

With two such remarkable sires together with our wonderful producing cows, you should have no difficulty in deciding where to purchase your next bull.

The demand is heavy for all the bulls we can produce.

Junior Herd Sire

Rosamaines Pontiac Netherland

This bull is a son of our senior herd sire and his dam is Stanislaus Princess Cleopatra with a seven day record of 525.8 pounds milk and 32.072 pounds butter. Test, 4.88 per cent. Her 30 day record is 1994.5 pounds milk, 124.44 pounds butter. Test, 4.99 per cent.

For full particulars regarding the young bulls we have for sale write

Rosamaines Ranch Stalder Bros., Owners Riverside, Calif.

Collie Dogs For Herding, cattle, sheep and turkeys. John G. Mee, breeder of Bronze turkeys and Embden geese. St. Helena, California.

GOATS

61 Head of Angora Goats for sale. K. J. Easby, Jr., Merced, California.

Shall We Set Hens in August?

By Jean A. Koethen

IF not, why not, and if so, why?

My attention was called to the advantages of August as a setting month and of September as a hatching month some years ago, when Rev. Edgar Warren, associate editor of the American Poultry Advocate, declared that August is, next to April, the best hatching month in the year. Had he lived in California, he would have said February instead of April, but if Eastern reasons for setting hens in August are good, California reasons are better. Acting on Mr Warren's suggestion, I began setting hens in August, found that he spoke the truth, and have continued to set hens in August ever since.

Before we decide to set hens in any month, we must be sure that we want or need chicks. If every chick that is to be hatched on general farm or specialty plant, could be hatched in January and February, a great deal would be gained. Hatching chicks is trying and expensive business, and the nearer we can come to raising all our young stock in one flock the better off we are. There is no argument for fall hatching except the one of expediency. Sometimes it happens that for lack of sitters or of brooding equipment we are not able to finish up our hatching in early spring. Sometimes hatches are unexpectedly poor, or misfortune overtakes the half-grown chicks. Sometimes a beginner is unable to begin in the spring, but can make a start in the fall. Sometimes hatching is delayed in the spring and we must choose between raising chicks in June and July or waiting till early fall.

Under any or all of these conditions, the beginner or sideline or farm woman, being fully persuaded that some chicks should be hatched between April and December, is justified in asking the question which appears at the top of the page, and the answer is an unqualified affirmative. By all means set hens in August if you need more spring layers, or roasters for late winter or fryers for Christmas. Not many hens, unless you wish to set them for their own sake, or can set them all about the same time, for looking after a lot of small broods through the chilly or rainy days of late fall is weariness to the flesh, but as many as you can care for comfortably. It would be a good thing if every hen that goes broody in August could be set, for the sitter molts easily and gets her new feathers quickly. She rests and incubates and does her fall dressmaking all at the same time. What a fortunate combination of circumstances, and how economical for all concerned!

But why August instead of September? Because, for one reason, there are more broodies in August. For another, because hens that are set in August hatch in September, when the weather is hot and the chicks that come out then find a world just fitted to their needs. October, in most seasons, is also a good month for chicks, but there comes now and then an October like that of 1916, when chilly rains began the first of the month and continued till Thanksgiving. In such a year the chicks that must be raised out of doors, either by a hen or in a fireless brooder, have a hard time. If we had reason to expect a wet October, it would be better not to hatch in September, but such is not our expectation, and the September chick has ordinarily a very easy life. Warm mornings, warm nights, long days that can be spent out of doors, few insect pests, for mites do not breed in the fall as they do in spring, and later in the fall an abundance of green feed from fall gardens and wayside weeds—such favorable environment makes the care of September chicks extremely easy. By the time cold winds and chilly rains come they are ready for the laying house or colony coop.

One great advantage of fall hatching, and this applies to September as well as to August, is that by that time the slackers and hens of doubtful vigor have stopped laying, and you breed, without any special effort at culling or selection, from the best. The hens that are laying good-sized, fertile eggs in August are the best hens on the place. Hatch their eggs and you are sure of bred-to-lay pullets, provided, of course, that the male is the son of a high producer.

Another advantage is that in August you are sure of your broodies. For those who must depend on hens, this is no small consideration. In January broodies are scarce. It is often impossible to get out February chicks because there are no broodies in January. Hatch in September, and you get pullets that will begin to lay in March and will lay steadily through the summer. Other things being equal, we would all rather hatch in February, but as between fall and late spring, fall is greatly to be preferred.

The difficulty experienced by many poultry people in securing a sufficient supply of green feed for their chicks during the long, dry summer months is gradually bringing us to the conclusion that in this climate chicks should, as far as possible, be gotten out of the shell between the first of September and the first of March, and more and more hatcheries are opening in the fall, not for their whole output, but to supply the increasing demand for fall chicks. The farm woman, who must depend on hens for her hatching would do well to do a large part of it in the fall, rather than trust to the belated broodiness of hens that have molted late. The fall pullet is not quite as profitable, perhaps, as the spring pullet, for she lays smaller eggs in the beginning, but she is a consistent summer layer. The fall hatched cockerel is more profitable for market than the spring cockered, for he goes onto the market as fryer or soft roaster just when prices are highest.

The fall cockered is not as valuable as a breeder, for he will reach ten months, the age at which cockerels are usually mated, in July. If he can be used in the breeding pen in the fall, that is, from August on, he will be just the right age for mating. If pens are not mated till January three of the best months of his first breeding year are lost. Cockerels that are intended for exhibition should not be hatched before January.

Poultry Queries--- Conducted by Jean A. Koethen

Worms Remedy

Please give remedy for round worms in chickens?—Subscriber.

A teaspoon of turpentine followed by a tablespoon of olive oil is a standard treatment for round worms, but a remedy more easily given and just as effective is that recommended by Dr. Beach of the California experiment station. This consists of tobacco dust or powder mixed into the dry mash in the proportion of one pound of tobacco to 50 pounds of mash. This may be left before both hens and chicks till all signs of worms have disappeared.—J. A. K.

Swell-head

My turkeys have been doing well until lately when some show a swelling under the eyes and running at nose. What can be done for them?—Subscriber, Owensmouth.

Your turkeys have swell-head, a form of roup. In many cases these swellings disappear in a few days or weeks. In others they develop into abscesses which must be opened and cleansed with antiseptics. Dr. Kaupp advises washing the nasal passage with a 20 per cent solution of common baking soda, using a medicine dropper or small syringe, as the catarrhal material must be forced through the nasal passage into the mouth. Follow this with an injection of peroxide of hydrogen. The soda dissolves and removes the mucus, and the peroxide cleans out the cavity. After the swelling under the eyes has been opened, cleanse it in the same way. Then inject into both places the following mixture: Oil of thyme, 30 drops; oil of eucalyptus, 20 drops; menthol, ten grains; oil of petrol, two ounces. In aggravated cases this treatment may be repeated three times a day. Give an abundance of clean water and soft, easily digested food.—J. A. K.

The New 16 Valve
Twin City Tractor
Pays Big Dividends

For the first time in the history of the tractor industry, the 4 cylinder, 16 valve engine (valve in head type) is now applied to a tractor. The TWIN CITY 12-20 with its 16 valve motor actually develops 25 per cent more than its rated horsepower.

This new 12-20 is a light weight tractor that will out-pull, out-last and out-dividend other tractors of equal rating.

Not built down to a price, but built up to a fixed ideal—to do the work assigned to it better than it has ever been done before.

The highest grade tractor will unfailingly prove the least expensive and pay the biggest dividends.

Grow Wheat in Western Canada

One Crop Often Pays for the Land

Western Canada offers the greatest advantages to home seekers. Large profits are assured. You can buy on easy payment terms,

Fertile Land at $15 to $30 per Acre—

land similar to that which through many years has averaged from 20 to 45 bushels of wheat to the acre. Hundreds of cases are on record where in Western Canada a single crop has paid the cost of land and production. The Governments of the Dominion and Provinces of Manitoba, Saskatchewan and Alberta want the farmer to prosper, and extend every possible encouragement and help to

Grain Growing and Stock Raising.

Though Western Canada offers land at such low figures, the high prices of grain, cattle, sheep and hogs will remain.

Loans for the purchase of stock may be had at low interest; there are good shipping facilities; best of markets; free schools; churches; splendid climate; low taxation (none on improvements).

For particulars as to location of lands for sale, maps, illustrated literature, reduced railway rates, etc., apply to Supt. of Immigration, Ottawa, Can., or

GILBERT ROCHE,

PRESERVING-TIME

All over the land there's a savory smell,
You meet it abroad or at home;
The days of your childhood come back for a spell,
No matter how far you may roam—
'Tis the scent of preserving the strawberry red,
The pineapple, raspberry, plum,
That the gooseberry, currant and cherry must shed
When the jelly and marmalade come

For the kitchen's a sight in these summery days,
As the kettles all simmer or steam;
The mountains of sugar we view with amaze,
And the fruits are an epicure's dream;
Abroad through the land goes the savory scent
Made by nieces of good Uncle Sam;
And prosperity's balm with th' odor is blent
Of marmalade, jelly and jam.—Anonymous.

SAMMY SAUSAGE'S DISCOVERY

"I NEVER knew before," said Sammy Sausage, "that children had so much sense."

"Do you know that now?" asked Brother Bacon.

"I do," said Sammy Sausage, twisting his tail and squealing delightedly.

"They're really quite nice and sensible," he continued.

"I'm sure they'd be pleased if they knew you thought that of them, Master Sausage," said Miss Ham.

"Now don't be sarcastic and rude," said Grandfather Porky. "You don't like it when some oue discovers something without your help, you know."

"That's not so, at all," said Miss Ham. "Some one else discovered this country, and still another discovered this farm and yet another discovered this pen—and I suppose my mother discovered me. None of those things annoy me in the least. They were all before my time."

"Then you will admit that you don't like to have anything discovered in these days that you don't have something to do with, eh?" asked Grandfather Porky.

"Oh, not altogether, and perhaps not at all," said Miss Ham grunting in a rather bored fashion, for she knew she was getting the worst of the argument.

"Go on with your speech," said Grandfather Porky to Sammy Sausage. "We all want to know what makes you say that you think children have so much sense."

"I didn't say I thought it, I said I knew it," squealed Sammy Sausage.

"Well, what makes you know it?" asked Pinky Pig.

"That's the sort of question to ask," said Sammy Sausage, turning his head and gazing at Pinky out of his watery pink eyes.

"I'm glad you can ask the right sort of questions," he said as he tried to smile with his very ugly snout.

"Go on and tell us," urged Brother Bacon.

"I will do so," grunted Sammy, "but first I must have a little nourishment."

"Ah, he's a pig all right. He must have food. Thinks of nothing but his fat little tummy. Ah, he's a pig," grunted Miss Ham.

"You hate to eat, too, don't you, Hammy dear?" asked Sammy Sausage.

"Nothing to do with my appetite," said Miss Ham. "I was talking of yours."

"Oh, to be sure, to be sure," said Sammy. "Now where is the small morsel of food? Or will it be a big one? I have been kept waiting and my appetite has increased.

At the mention of food all the pigs had picked up some goodies for themselves but had not given any to Sammy. Of course he was not surprised and he grabbed for some good bits himself.

"I feel better now," he said.

"Continue with your story," said Pinky Pig.

"Begin it," said Grandfather Porky. "He can't continue when he hasn't yet begun."

"All right, only hurry," said Brother Bacon. "It will soon be time for supper."

"Children like mud," said Sammy. "They make mud pies. They actually enjoy it. Now haven't they sense?"

"They have, they have," squealed all the pigs. "The children like mud like their dear piggies."

"Perhaps they would like to be like us," said Miss Ham.

"They wouldn't show sense if they didn't," said Sammy, "and I am sure they must, for I have seen so many making mud pies lately that I have come to the great and final conclusion that children are sensible. They like mud!"

"And a great discovery," said all the pigs.

"Ah, trust your little Sammy to find out what goes on in the great world," said Sammy Sausage, squealing with pleasure, for all the pigs were smiling upon him.

"And I know something else, too," said Sammy.

"He knows something else," squealed all the pigs.

"They like to eat! I heard them say so! They were talking about their next meal when they were making mud pies! Yes, they were talking of goodies to eat."

"The bright little things," said Grandfather Porky.

"They weren't so little," said Sammy.

"The bright big things then," said Porky.

"Ah, it must be a pleasure for children to be so like pigs," said Sammy and as all the creatures around were pigs they didn't know that children would not have been flattered by such a silly remark!—Exchange.

HELPS IN WASHING CLOTHES

Continuing the practical helps for housekeepers given in the past two issues of the Cultivator, we give this week laundry helps. These also are from the Oregon agricultural college bulletin by Ruth McNary Smith.

In laundering clothes, a process should be chosen that will remove stains and soil with the least possible injury to the fabrics. For the best results it is important to use the best soap, bluing and starch.

Soap

The yellow savon soaps contain a great deal of rosin and free lye and are injurious to fabrics as well as the hands. It is really an economy to buy the white laundry soaps and if some additional aid seems necessary, a little washing soda may be used. A soap solution made by dissolving one bar in one gallon of water is a convenient and economical way of using soap.

Soap Powders

Soap powders are composed of cheap yellow soap finely pulverized, washing soda, soda ash, etc. They are too strongly alkaline to be used safely as a regular thing on cotton and linen and will yellow wool and silk.

Bluing

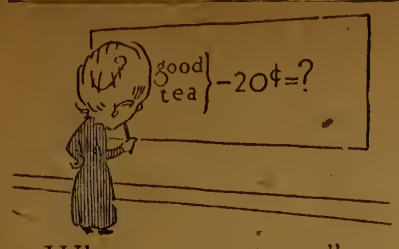
Analine bluing is the cheapest and most effective bluing on the market, as it has none of the bad qualities of the other bluings. It may be purchased by the ounce or pound from any laundry supply house. One ounce in powdered form makes a gallon of liquid bluing which is enough to last for many years.

Most liquid bluings are composed of coal tar dye dissolved in water, with Prussian blue frequently added Powdered bluings are almost invariably Prussian blue, which being an iron compound is likely to cause rust spots or a general yellow tinge if the clothes are not very thoroughly rinsed. A good grade of ball bluing, if used in a bag of at least two thicknesses, is very satisfactory. The cheaper grades are not an economy as they are aduiterated.

Starch

Flour starch is cheaper than package starch; it makes the garment more pliable and is less lustrous. In selectiug package starch it is well to get that with small crystalline sticks, rather than in large irregular lumps, as the latter usually contain impurities, making straiuing necessary. The following proportions are for starch of medium stiffness made from package starch:

One and one-half tablespoons starch mixed with a little cold water, one and one-quarter teaspoons lard or paraffin, one teaspoon borax, one



When you "save" 20 cents a pound on tea, you lose money on every cup. Fine tea is really cheaper than common tea.

And you miss the real tea-flavor, the comfort, the cheer, the invigoration, that every tea-drinker has a right to.

Get Schilling Tea and your rights as a tea-drinker.

There are four flavors of Schilling Tea—Japan, Ceylon-India, Oolong, English Breakfast. All one quality. In parchmyn-lined moisture-proof packages. At grocers everywhere.

quart boiling water. Mix the starch and cold water, add lard and borax and boiling water, cooking thoroughly in a closed utensil to present scum.

Javelle Water

Occasionally a bleach of some sort is needed to remove stains and Javelle water is perhaps the safest. However, it should not be used regularly and should be made very dilute. Following its use rinse the fabric thoroughly and dip in water containing ammonia.

One pound washing soda, one quart boiling water, one-half pound chloride lime, two quarts cold water. Dissolve the soda in the boiling water in an enamel pan, the chloride of lime in the cold water. Pour the liquid off the latter, after it has settled, on to the soda. Bottle tightly and keep in a dark place.

Stains should always be attended to before laundering. If soap and water will not remove them there is danger of setting. The longer a stain stands the more difficult it is to remove. Avoid using strong alkalis on silk and wool, as they are softened and yellowed by these.

Acids, except those made very dilute, should never be used on cotton and linen without carefully neutralizing afterwards with ammonia, washing soda, or borax water. Javelle water will remove many difficult stains, but should be used carefully and never on wool or silk. Removing stains on fabrics not easily washed as silk and wool should be done without the use of water if possible, that is by means of absorbent processes. For greasy stains of any kind volatile cleaning materials like gasoline and turpentine should be used.

Directions for treating some of the more common stains will be given next week.

HOUSEHOLD QUERIES

Dill Pickles

Please give again in the Cultivator a recipe for dill pickles, published about this time last year. I have lost mine?—Subscriber, Los Angeles.

Use knife to cut cucumbers from the vine so as to leave a short stem. Do not rub off the little briers. Cucumbers three to four inches long are a good size for dill pickles. Put layer of grape leaves on bottom of stone jar, then a layer of dill, then a layer of cucumbers, repeating grape leaves, dill, cucumbers till jar is full. Cover top with grape leaves. Make brine of six quarts water to three-fourths pound salt (enough for 100 ordinary sized cucumbers). Boil. After cooling pour over cucumbers, with the addition of seven cups vinegar if wished. Place cloth over pickles, over this a board or plate that will fit down on the pickles. Weight this down so that all cucumbers are forced beneath the brine. Leave in dry cool place ten days, then pour off brine, wash pickles carefully and cover again with cold, freshly boiled brine (or brine and vinegar) as before. The pickles are ready for use in about 30 days. About two pounds of dill is required for four gallons of pickles.

ALL THE SAME TO HER

"I shall have to ask you for a ticket for that boy, ma'am," insisted a conductor, speaking to a quiet-looking little woman. The woman declined to pay.

"I am afraid if you don't pay for that boy I'll have to stop the train and put him off," he persisted.

"All right; all the same to me," she said.

"You ought to know the rules. How old is that boy?"

"I don't know. I never saw him before."

PLUMBING THE DEPTHS

An American motorist, stopped by a Scotch constable for speeding hinted broadly that he might pay to be let off.

"What, sir!" cried the constable. "Dae ye suggest that I wid take a bribe? Dae ye dare to insult me, sir?"

"Oh, excuse me," said the American. "I really—"

"But, now," put in the constable, "supposin' I was that kin' o' a man, how much wid ye be inclined to gie?"—Boston Transcript.

A teaspoonful of borax to a quart of water will make hard water soft so that it can be used for washing the most delicate skin.

Why Ajax Tires Are Farmers' Choice

There's one big outstanding reason—greater mileage.

The man who farms is much more vitally concerned with tire service than his in-town brother. He requires topmost tire strength, for the roads his car must travel are not always sleek and smooth.

And so, sooner or later, he chooses Ajax Tires—the only tires possessing Shoulders of Strength.

Ajax Road King

Ajax Shoulders of Strength are buttresses of rubber that brace both sides of the tread. Note the picture of the Ajax Road King. See how that burly tread is buttressed. It has more rubber where it should be—more tread on the road. Shoulders of Strength are chiefly responsible for the surprising mileage records established by the Ajax Road King.

Your nearest Ajax dealer carries a complete supply of Ajax Road King tires—also Ajax Inner Tubes, and Ajax H. Q. Tire Accessories.

Ajax Tires Are Guaranteed In Writing 5000 Miles

Heider

15% to 20% Fewer Parts —Years Added to Tractor Life

HEIDER Friction Drive does away with clutch, transmission gears and bevel gears. All three units are in one. Power ordinarily used up by these parts is put into drawbar pull or belt work. Steady, resistless power under perfect control. **Seven speeds forward, seven reverse,** for traction or belt work with one motor speed, one lever. Saves wear because of fewer parts. Easier operation—the simplest drive known. **No transmission gears mean no gear stripping.**

Rock Island No. 38 One-Man Tractor Disc

Close-up levers. One man easily operates both tractor and disc.

Rock Island One-Man Outfits

Heider Model D 9-16 with No. 9 Rock Island C T X two-bottom Power Lift Plow directly attached. Your hands guide the tractor. Your foot controls the plow.

11 Years Actual Field Work

You do not have to take a one or two days' "demonstration" as proof of Heider. America's leading power farmers have been using Heiders for 11 years. Many of the original Heiders are in faithful use today.

Write for our new illustrated catalog of HEIDER, which also describes the famous Rock Island CTX Tractor Plows and the Rock Island No. 38 One-Man Tractor Disc.

What Users Are Saying

"I bought a Heider 9-16, with plow attached, last spring and am highly pleased. Would not exchange it for any other." Eugene Sites, Elyria, O.

"Have used my Heider 12-20 for two years; the longer I use it the better I appreciate its valuc."
Henry Adam, Warren, Minn.

"I purchased my Heider three years ago. I farm 350 acres, and if I was purchasing another it would be a Heider." A. L. Barnes, Chappell, Neb.

DRIED FRUITS

The California Prune and Apricot Growers, Inc., announce prices:
Peach prices for the 1919 crop were announced at Fresno, July 16, by the California Peach Growers Inc. The price list agreed upon by the directors and announced by General Salesmanager Sturtevant, follows:
Effective this date and until further notice, our prices f. o. b. our California factories, on 1919 crop dried peaches for the domestic and foreign trade: September, October, November shipment, sellers' option; guaranteed against our own decline until January 1, 1920, are as follows:
Standard yellows, 14¾; Muirs, 15.
Choice yellows, 15¼; Muirs, 15½.
Fancy yellows, 16½; Muirs, 17½.
Extra fancy yellows, 17¾; Muirs, 18¾.
Slabs yellows, 14½.
For "practically peeled" add 1½ cents per pound (any grade).
Prices above are all bulk basis.
For packing in: 50-pound or 25 kilos boxes add 1 cent per pound.
25-pound or 12½ kilos boxes, add 1¼ cents per pound.
10-pound boxes, add 2 cents per pound.
Blue ribbon peaches packed five-pound cartons, 12 per case, 12.00 per case.
Blue ribbon peaches packed two-pound cartons, 24 per case, 10.00 per case.
Bakers' special, "practically peeled," 16¾ per pound, bulk basis.
Figs: Wh. stand., 16; ch., 18½; ex. ch., 20; fy., 22½.
Apples: Ch. (in 50's), 21; ex. ch., (in 50's), 21½; fy., (in 50's), 23.
Pears: 1919 crop, stand., 20; ch., 22½; ex. ch., 23½; fy., 26.

GRAIN AND FEEDS

Oats: Red feed, 2.80@2.90; black 2.90 @3.00 per cental.
Corn: California yellow, 3.35@3.45 per cental. Egyptian 3.25@3.35; Milo maize, 3.10@3.12½.
Rye, 3.30@3.75.
Wheat: Following are net weight prices for bulk grain, based on federal standards and grades at San Francisco Bay and Los Angeles terminals:

Hard Wheat—	Per Bushel	Per Cental
No. 1	2.20	3.66 1-3
No. 2	2.17	3.61 2-3
No. 3	2.13	3.55
Soft White—		
No. 1	2.18	3.63 1-3
No. 2	2.15	3.58 1-3
No. 3	2.11	3.51 2-3
Club and Sonora—		
No. 1	2.16	3.60
No. 2	2.13	3.55
No. 3	2.00	3.48 1-3

For sacked grain add nine cents per bushel of 60 pounds to above price. Deduction of three-fourths of a pound is made for weight of standard grain bags. Wheat grading under No. 3 and mixed or smutty wheat will be purchased according to merit.
Mill Feed (per ton): Bran 43.00@44.00; mill run, 42.00@43.00; Rolled barley. 52.00 @54.00. Linseed oil cake meal, nominal; cocoanut cake or meal, 41.00@42.00 per ton.

HAY

Under date of July 26, Scott, Magner & Miller says:
Receipts past week 2770 tons. Receipts probably will continue to increase for several weeks unless the shortage of cars prevents. A large portion of the hay received during the week has been by boat from Bay and River districts. Demand has been fairly active and prices have been maintained without difficulty. The heavier portion of the hay receipts has been of wheat hay of all grades. Most of the Red Oat hay has come in by boat from the reclaimed districts and has been of good quality. Several sales of round lots have been reported from country districts where trade has been better than for some time. This is especially the case with alfalfa. Owing to reported shortage of water in some of the irrigating districts and to the grasshopper pest in others, alfalfa has been held firm on a higher range of prices than heretofore.
We quote today wholesale prices in carload lots for old hay as appear from dealers' transfers upon the hay market—for prices to consumers charges of cartage, commission and handling expenses must be added according to conditions:

Fancy Wheat hay (light 5 wire bales)	17.15@18.00
No. 1 Wheat or Wheat and Oat hay	15.00@17.00
No. 2 Wheat or Wheat and Oat hay	12.00@14.00
Choice Tame Oat hay	16.00@17.00
Other Tame Oat hay	12.00@14.00
Wild Oat hay	10.00@13.00
Barley hay	12.00@15.00
Alfalfa hay	16.00@20.00
Stock hay	9.00@11.00
No. 1 Barley straw, bale	50@80

Citrus Markets

Los Angeles, Cal., July 30, 1919
Wide variation in quality makes for big sprcad in prices. In general the Valencia market is much stronger than for scveral weeks.
The demand for sound, high grade stock of lemons is keen, but there is a vast quantity of low grade fruit commanding red ink.

Shipments

Shipments of citrus fruits to date since November 1, 1918:
Southern California; oranges, 28,792, cars, lemons 8254, total 37,046.
To same date last season; oranges, 12,477, lemons 4498, total 16,975.
Central California this season; oranges, 4427, lemons 354, total 4781.
To same date last scason; oranges, 2539, lemons 115, total 2654.
Northern California; oranges, 244, lemons 2, total 246.
Last year same date; oranges, 203.

JUNE DROP

Continued from Page 113

and show up on packing as heart or navel end rot fruits. These fruits, however, represent the few which are able to resist the attacks of the fungus and persist to maturity. The greater part of the affected fruits fall from the trees before reaching two inches in diameter. These fruits if cut open will exhibit a dark discoloration under the navel end which if cultured usually readily give the Alternaria.
On account of the nature of infection occurring in the navel end and the universal presence of the fungus spores, this fungus being found practically everywhere, there seems to be but slight hope of controlling the fungus drop by spraying. Cooperative spraying experiments have so far failed to show any results whatever. More work along the control of the fungus by spraying should be undertaken and is being planned for next season. It may be that the two or three sprayings with two per cent lime-sulphur, necessary to control thrips, will also act to prevent at least a part of the Alternaria infection.
Apparently the best hope for successful control of the June drop lies along the lines of the use of the summer cover crop or in the finding of heat resistant sports which are satisfactory in other respects.
In regard to the relation between time of plowing and blooming and the set of fruits there is considerable diversity of opinion, occasioned largely, in the opinion of the writer, by differences in root distribution in orchards. The writer has yet to find a grower who insists that deep plowing at the time of bloom, cutting and tearing off a large part of the feeding roots, is conducive to a heavy set. On the other hand there are many who are certain such a practice is prejudicial. There are growers, however, who insist that such a practice has not resulted in a heavy drop. In practically every case of this kind investigated by the writer he has found the feeding roots located rather deeply. It is also well recognized that fall or very early spring plowing even though comparatively deep does not cause the injury that late plowing incurs. This is undoubtedly due to the fact that the trees entirely recover from the shock and are able to put out a new system of feeding roots before the bloom comes on. The whole question therefore seems to be one largely of the location of the feeder roots.
There is not a particle of evidence to show that irrigation at the blooming period is necessarily connected with an increased dropping. There is, however, much evidence to show that it is of the utmost importance that trees be adequately supplied with moisture at this time. Irrigate when the trees need it, irrespective of the bloom, seems to be a good rule to follow.

WEATHER REPORT

San Francisco, California, July 26, 1919.

Sulphur

It has been proven and so recommended by the University of California that if you sulphur your grape vines and orchards SIX times they will not be affected by MILDEW or RED SPIDERS.
ANCHOR Brand Velvet Flowers of sulphur, also EAGLE Brand, Fleur de Soufre, packed in double sacks, are the fluffiest and PUREST sulphurs that money can buy; the best for vineyards; the best for bleaching purposes, LEAVING NO ASH.
VENTILATED Sublimed Sulphur—Impalpable Powder, 100 per cent pure, in double sacks, for Dry Dusting and making Paste—(Atomic Sulphur).
For LIME-SULPHUR SOLUTION, use our DIAMOND "S" BRAND REFINED FLOUR SULPHUR. We can furnish you this sulphur at such a low price that it would pay you to mix your own solution and net you a profit equal to the amount paid out for labor in spraying your orchard, even if you pay your men $4 per day for making the solution and applying same.
To create additional available plant food, drill into the soil 100 to 400 pounds per acre DIAMOND "S" BRAND POWDERED SULPHUR, 100 per cent pure. This has increased various crops up to 500 per cent.
Also PREPARED DRY DUSTING MATERIALS, Tobacco Dust, Dry Bordeaux, Dusting Sulphur Mixtures, etc.
And "Anchor" Brand Standard LIME-SULPHUR SOLUTION 33 DEGREES BE., Sulphur Paste, Nicotine, Blackleaf 40, etc. Fungicides and Insecticides.
Carried in stock and mixed to order.

San Francisco Sulphur Co.

624 California St. San Francisco, Calif.

We are equipped to make immediate shipments. Send for "ILLUSTRATED BOOKLET," also booklet "NEW USES FOR SULPHUR", Price-list, and Samples.
Please state for what purpose you use the sulphur, quantity needed, and date of shipment preferred. Telephone Kearny 871.

Has the Farmer any Opinions of his Own

AFTER listening to the arguments with which some tractor salesmen try to convince him, you might suppose that the farmer never did any thinking for himself.

You will hear them telling him how many wheels his tractor ought to have, or what it ought to look like, or some other inconsequential detail—appealing to his eye instead of his intelligence.

Now, the farmer is a practical man.

He is looking for facts—not theories or impressions.

He is looking for a tractor that will do his work, and do it economically, and last a long time.

And the more critical he is, the more determined to get at the facts, the quicker he comes to the G O Tractor.

For eight years the G O Tractor has been the standard among practical farmers all over the country. Because of its advanced driving mechanism, it is the easiest tractor on the market to control and the most economical to operate. It has six speeds forward and six reverse—a right plowing speed in any sort of soil; a right speed at the belt for any kind of machine. It is the most powerful tractor in America for its weight.

Years are added to its life by the dust-proof casings on its gears. It was the first tractor to enclose its gears in an oil bath. It has no gears or chains on the traction wheel to be cut by sand and gravel.

The G O Tractor is the four-wheel, four-cylinder type—the simplest and most practical type of all. Every part of the motor and driving mechanism is instantly accessible. Adjustments can be made by anyone right on the ground, without the aid of special tools.

The farmer with a practical mind, who is looking for indisputable facts, and good sound horse-sense—not "talking points"—we shall be glad to send some further information about the most advanced tractor in America and about the company behind it—its guarantee and the service that goes with it.

Vol. LIII — August 9, 1919 — No. 6

Spraying: When, Why and How to Do It

THERE are biters; there are eaters; there are borers which undermine and sap the life of plants; there are flyers and crawlers; there are pests of plants at both top and root; there are rusts and rots, mildews and molds; there are rodents; there are birds; all causing untold loss to the human who would grow food for his own and for his neighbors. Ten figures are not sufficient to express this awful loss every year. It has always been and always will be, though there are vastly more people today with a determination to lessen this loss than ever before.

Only during the last year has the federal government awakened to the immensity of these destructive losses. Today there are efficient quarantines being installed which prevent free passage of many of these pests from other countries to our own. California was the leader in securing the legislation which made this step possible. California has for years been the most advanced in pest fighting of any section of the world. From the Orient, from Australia, from various parts of Europe, from South America experts have come to California to learn how we do it, and the gospel of quarantine and more efficient pest fighting methods has been freely preached by this state. Therefore, as a section which has advanced intensive agriculture as have few others California has credit for many of the advanced methods of work now used in all parts of the world.

The Cultivator has endeavored to disseminate information as to best methods of pest control since it was founded nearly a third of a century ago. Beginning with the issue of November 3, 1910 it has occasionally devoted almost an entire issue to pest fighting, to spraying, to fumigating, to poisoning, to general control of all kinds of crop and animal pests. These special issues have been classics, and two large publications on methods of pest control have followed almost identically the plan first adopted by the Cultivator in putting this information into the most usable form.

Notwithstanding this campaign and the most helpful bulletins of the bureau of entomology of the department of agriculture, the state horticultural commission, experiment stations of the state university, chemical companies and other specialists, questions continue to come to this office requesting help and yet showing that many of our growers have only a very crude understanding of the pests which are costing us so much and which surround us on every side. One has sprayed his scale with Bordeaux and still they live. Another has fumigated and still red spider flourishes. Another has planted clean potato seed and harvested scabby potatoes. Such incidents might be chronicled endlessly, for the problems of agriculture are great, and so many of us are just beginning that we have not yet fully grasped them.

The grower must bear in mind that there is at times intimate relation between fungus and insect pests. For example, the black smut, or sooty appearance, of many trees may be caused entirely by exuding of honey dew which may be the result of aphis or scale pests. The control of these insects effectually controls that particular fungus trouble. This is not only true of fungus but of some bacterial troubles. For example, insects may carry from flower to flower of the pear tree cultures which result in extension of blight.

Biters

We do not know that it is scientific, but for convenience let us divide the insect family into two great classes; biters and suckers. We believe the scientific men call the insects with jaws mandibulates. In this class are the June beetles, potato bugs and almost numberless other pests. These insects may be reached by sprays carrying an arsenate or some form of poison.

Suckers

The other class carries its own drilling apparatus and pumping machinery to extract the juices of plants and destroy their productiveness and even life. Instead of reaching these insects with poisons so-called contact insecticides are used, and they are smothered or their tissues are destroyed by these oily or caustic contact sprays or by poisonous gasses.

Fungus

Still another group of pests affecting every living thing and causing awful losses is fungous diseases.

Bacteria

Closely related to the fungus are many of the bacterial troubles. The most common case of this is perhaps the fire blight of the apple, pear and quince, summer wilt of tomatoes and similar diseases. For most of these troubles no spray has any effect. The trouble is usually within the tissues of the plant, and cutting and destruction by fire of the affected parts is the only protection.

Fusarium or blight of the tomato affects the root system of the plant so that once it is noticed there is no help whatever for that particular plant.

Still Others

Then there are the rodents or four-footed pests, the birds, and so on ad infinitum. These will all be handled in their turn in the following pages.

Various Formulas

There are literally thousands of formulas which have been used and recommended. They are more or less efficient, likewise expensive and sometimes inefficient according to the intelligence of the operator, according to weather and numberless other conditions.

Few of these formulas, less than 50, will be given in this issue, but we endeavor to give representative and tried formulas in each case. In addition we may say this is more for reference and only occasional use where it is impossible to secure fresh and dependable commercial mixtures. There has been great advancement made by large chemical concerns, and the sprayer or fumigator today may have his ready-to-use mixtures in sealed containers. This is true with fungicides and various kinds of insecticides. It is true even of hydrocyanic acid gas. It has been the custom until the last 12 months to manufacture under every tree. Now the gas in liquid form is simply pumped under the tree, and more effective and

Continued on Page 136

THERE WERE LOCUSTS

Something like three thousand five hundred years ago Moses wanted to secure relief for the children of Israel and one of his arguments to Pharaoh was that he had better let them go or the East wind would come and bring a plague of locusts. Pharaoh was hard hearted and so was Moses, for the East wind brought the locusts and the crops "even all that the hail hath left" were taken by the locusts. "Before them there were no such locusts as they, neither after them shall be such."

The grower who has observed the powers of our modern day insect has the idea that there has been some improvement in pest efficiency in the ages which have passed.

Apparently Asia Minor had no quarantine in force for we note some years later when these same children of Israel were finally released from Egypt and made their 40 year journey to the land of Canaan they must have carried along in their luggage some of the infestation for as they were ready to cross the Jordan "Thou shall carry much seed out into the field, and shall gather but little in; for the locusts shall consume it."

Nor is there much hope for the wicked, for some 15 or 16 hundred years later out on an island in the Mediterranean an inspired prophet looked into the future and wrote: "And he opened the bottomless pit; and there arose a smoke out of the pit as the smoke of a great furnace" • • • "and there came out of the smoke locusts upon the earth; and unto them was given power".

Modern day insects are of the bottomless pit kind and the fruit grower or the farmer who would succeed can do so only by making his smoke more effective than that of the bottomless pit.

OUR ADVERTISERS RELIABLE

We guarantee our subscribers against loss through dishonesty of any advertisers in the Cultivator. We do not attempt, however, to adjust trifling differences between subscribers and honest, responsible advertisers, nor will we pay the debts of honest bankrupts. Notice of complaint must be sent us within 30 days from date of the transaction, and the subscriber must have mentioned the Cultivator when writing the advertiser.

THIS WEEK'S COVER

The cover this week starts something. It starts a mass of pest fighting suggestions. There are so many pests and so many formulas and suggestions for handling them them that it appeared there would be no room for more graphic material on cover page. It is not often these pest fighting numbers have been issued; this is the fifth over a period of some nine or ten years, and we find they are proving invaluable to Cultivator subscribers. The service is perhaps not so great as the first special issue showed along this line, for our state university, our state horticultural commission and our county horticultural commissions have been giving more attention, or rather, more publicity, to pest fighting and have issued many bulletins, most of them having to do with special crops or special pests.

CREDIT

In securing the material for this issue we have drawn mainly from former numbers of the Cultivator, eliminating, however, a large part of the old time formulas, supplying others as later investigations have shown where improvements were necessary. The greatest change in procedure is in fumigation and the handling of walnut pests. For suggestions as to these changed methods we are indebted to H. J. Ryan, horticultural commissioner of Los Angeles County, to R. W. Hodgson, farm adviser of Los Angeles County, and to others.

The changes in fumigation methods are largely due to the work of William Dingle, in perfecting methods of application of liquid hydrocyanic acid gas; Professors Quayle and Ralph E. Smith of the state university have developed methods of work which are proving effective with walnut aphis and walnut codling moth; and for advancement all along the line credit is due to thousands of growers who have patiently dug and worked that California fruits and other products should be sent to markets clean and attractive, that California's fair name may be made fairer and with assured profits which mean better homes and better people.

IT COSTS

Something of the worth or, perhaps more correctly, lack of worth of the insect "industry" to California may be shown by the fact that the state will this year use more than 2000 tons of cyanide of potassium in fighting citrus pests alone. Other thousands of tons of sulphur, lime, tobacco bluestone, arsenates and fish and mineral oils will also be used. Thousands of men and large equipment are also required.

Does this investment pay?

Many years ago careful estimates made by the department of agriculture showed that the insect and fungus loss to agriculture of the United States reached the enormous total of a thousand millions annually. One pest, the Hessian fly, in its attacks on the grains of the country caused a loss of over 100 million dollars. The chinch bug came in for a credit of some two or three hundred million. Ten per cent loss to the hay crop was caused by various pests affecting it. This loss amounted at that time to $65,000,000; at present prices doubtless it nearly doubles that. The cotton plant suffers losses which it is impossible to compute. The loss from the apple worm runs into the millions, and animal products are reduced by at least $300,000,000 because of various pests and parasites.

No wonder then that the fruit growers think of their crops and buy these thousands of tons of material to reduce the ravages of insect pests.

QUARANTINE

The fearful loss from introduced pests was never so fully appreciated as it has been since the beginning of the war. The human race needed so much that it begrudged the tithe required by the pests, and this has resulted in quarantine laws which California has urged for years, but which the national government has failed to give us because of pressure by importers. That pressure has been forced to give way though effort is still being made by the importers to discredit our present law.

It was an inspiration to those who attended the convention of fruit growers at Riverside to hear from Prof. Marlatt of his determination to give the country efficient enforcement of the law. Untold millions of loss have been suffered by this country which might have been prevented by quarantine enforced years ago. Strength to the arm of Prof. Marlatt.

There are pests we know not of, and we crave continued ignorance. It is to be hoped that congress will consider the interests of the people rather than listen to the profiteers.

WEED CONTROL

There is always a seeking for a royal road to several things beside fortune, but like the royal road to fortune these other roads are largely paved with other than good intentions, hard work, frugality and efficiency. In weed killing the question continually comes up: "How can I eradicate this or that or the other pest?" And the most practical of answers is: "With good sharp tools and hard work."

Prof. G. P. Gray of the University of California has made extensive investigations in chemical control of weed pests. But so many questions entered into this, all the way from economy to weather conditions, that it is a matter for the expert rather than for the practical farmer. At least this is the case as a rule. The spraying of mustard and a few other pests of grain fields with sulphate of iron solution has secured beneficial results. Still its use is very limited. Treatment of morning glory and other pests has not yielded uniformly satisfactory returns.

The principal points to observe in weed control are: Prevention of seeding of plants already established; prevention of introduction of weed seeds with other seeds; prevention of top growth of perennial weeds and then clean culture. Sharpen the weed cutter; sharpen the scythe; keep the pests down. It takes time and patience, but it's the only successful way.

FUMIGATION

It takes considerable time and a whole lot of talent to secure simplicity in methods, machinery or implements. The mind seems to run to complexity and roundabout methods of doing things at their inception. We recall that nearly a third of a century ago we spent many a night watching the beginnings of fumigation in Orange County orchards, and well do we remember the mammoth derricks rigged on trucks and hauled through the orchards of the Bishops, Dr. Wall and others who were endeavoring to reduce fumigation methods to a practical working basis. This work was then largely under the direction of Prof. D. W. Coquillette of the department of agriculture.

It was but a few years until the great derricks passed and the pole method of hoisting tents was brought into action. Then came simplification of the methods of manufacturing gas, always, of course, under each tree. Later it was manufactured in machine and injected under the tent.

Now comes the simplest and best of all these methods. The gas is factory made and delivered to the grower ready for use without any of the manufacturing complications in the orchard. This is the first year the hydrocyanic liquid is being used in a large way. Last year it was used experimentally in many sections of the state, and the experiences of that year showed wherein the method was entirely practical, was cheaper and more effective. While there are still some complications due to atmospheric conditions this simplification has meant much more effective service.

This liquid hydrocyanic acid is now delivered from the factory to the orchardist for immediate use at a price far lower than it cost him a few years ago, this contrary to war price influence. Today the orchardist buys his liquid gas for 60 cents per pound, and one pound of this liquid has the efficiency of two pounds of the solid cyanide. Some of our growers well recall that the price of cyanide was materially above 30 cents.

A CHECK ON PACKERS

From time to time articles touching the problem of live stock marketing have appeared in the Cultivator. The general trend of all such articles has suggested the necessity for proper and efficient control of the industry, especially from the standpoint of the producer. On a number of occasions it has been suggested that one of the primary needs of the California live stock producer is an open and competitive market based on established grades and classes as developed by the operation of union stock yards. But, because it has been recognized that certain ills have developed on Eastern markets, the reservation has always been made for a federal or state controlled marketing system. The Cultivator does not fail to recognize the efficiency developed by American packers; at the same time, we believe that too great a centralization of power in the hands of a few, especially when such centralization touches such vital commodities as food, is a menace to the public welfare, and we believe it to be a function of the government to exercise proper control over such tendency.

It has long been urged, and often demonstrated, that through the ownership or control of pubic stockyards and refrigerator cars the larger packers are in possession of agencies that permit them to wield a tremendous power over the producer and consumer should they care to make use of their advantage. This being the case, we look with favor on the Kendrick and Kenyon bills now before the senate.

Both bills are substantialy the same, differing mainly in their administration. The Kendrick bill was prepared by Senator John B. Kendrick of Wyoming, who is also president of the American National Live Stock Association. Briefly, the bill approaches the problem of packer control from three angles.

First: It provides that every person, firm or corporation engaged in the business of handling, slaughtering, preparing, or marketing live stock or live stock products in interstate commerce shall operate under a license issued by the secretary of agriculture upon application.

Second: In order to prohibit the common ownership of meat packing houses and stock yards, it is provided that no common carrier shall unload live stock at a stockyards owned wholly or in part by a licensee engaged in the slaughtering of live stock.

Third: In order to place refrigerator cars at the disposal of the general public under the same terms and conditions that apply to other means of transportation, the bill provides that no common carrier shall, after the expiration of six months from the date of passage of the bill, employ any privately owned refrigerator cars except on the condition that they be furnished by the carrier, with the approval of the interstate commerce commission, to any person making reasonable request therefor.

Licensees under the bill are forbidden to engage in unfair and discriminatory practices, to conspire with one another, or to combine to prevent competition or to establish monopoly.

The bill, we believe, is constructive. It has been indorsed in principle by practically all the important livestock producers' organizations and deserves the active support of all live stock interests. It will not, however, become a fact without a militant attitude on the part of the producer.

Agricultural News Notes of the Pacific Coast

Northern California

Dried wine grapes are being contracted for at eight cents.

Rice growers near Live Oak, Sutter County, are short of water.

Coutolenc district of Butte County reports little trouble with pear blight.

Glenn County farm bureau is making an agricultural survey of the county.

Placer County's fruit is practically all two weeks ahead of last year in ripening.

A large crop of hay is being harvested in the Indian Valley section of Plumas County.

Three cars of dried apricots were sent direct to Antwerp, Belgium last week from Chico.

Rice growers expect the crop of the Sacramento Valley this season to run about 4,000,000 bags.

Fred Ellenwood of Red Bluff is making large shipments of spring lambs to San Francisco markets.

Nevada County farm bureau is planning for farm bureau picnic to be held in Penn Valley later this summer.

The state highway commission is making preparations for construction over Adin mountain in Modoc County.

The entire pear crop of members of the Contra Costa Pear Growers' Association has been sold for $85 per ton.

Mendocino County is joining the state in a campaign against coyotes. Expert coyote hunters will be employed.

The volunteer fire company in Susanville, Lassen County has a membership of 140 and six automobile trucks.

Rice growers of the Sacramento Valley appreciate the hot weather that has been giving proper maturity to their crops.

The Tuolumne Apple Growers' Association completed its organization at a special meeting held at Soulsbyville recently.

Prunes in Butte County have been showing serious drop, Commissioner Mills reporting some orchards suffering 50 per cent loss.

Irrigation ditches on the Durham land settlement property have been practically completed and grading of alfalfa lands is progressing.

The Paradise district of Butte County will have several carloads of Bartlett pears to ship. Much of these will go to canneries at Oroville.

A 500,000 sack capacity warehouse is being added to the mill of the California State Rice Milling Company across the river from Sacramento.

A Chico hop grower reports contracts for his 1919 hops at 50 cents a pound, said to be the record price since the wild speculation of 1882 when as high as $1.10 was paid.

The Chilean government has established a seed bureau at Sacramento. Testing and purchasing of seed before shipment and buying farm implements for work in South America are features of the work of the bureau.

Proposal to lower the flood gates of Lake Tahoe to supply irrigation water for the Newlands irrigation project in Nevada is being strenuously fought by the Placer County Chamber of Commerce and other interested bodies of that section.

Central California

Merced County has decided to make no exhibit at the state fair at Sacramento.

Stanislaus County farm bureau has organized its second cow testing association.

Terra Bella, Tulare County, reports apricots running nearly 65 per cent fancy fruit.

A gopher extermination campaign is being waged at Fort Romie, Monterey County.

The San Joaquin County agent is teaching girls cold pack methods of home canning.

Second set of cantaloupes in the Turlock district is very light, many vines showing none.

Farm centers of Monterey County are nearly all planning to take part in county fair activities.

Irrigators of Inyo County are employing attorneys to protect their rights against power companies.

Southern California tomato growers are having more trouble with tomato blight than in any preceding year.

Fresno County breeders of Duroc-Jerseys held banquet at Fresno August 2 to organize a county association.

Warehouse containing approximately $150,000 worth of grain was destroyed at Los Banos, Merced County, last week.

Black aphis are appearing in the bean fields of Stanislaus County. Blackeyes and Limas have been particularly affected.

Commissioner Rutherford of Stanislaus County is filing claims for cost of squirrel poisoning on ranches which failed to clean up.

Communities throughout the county are planning exhibits for the Fresno district fair to be held September 30-October 4 at Fresno.

A new irrigation district to take in some 50,000 acres near Corcoran in Kings County is proposed as a part of the Pine Flat project.

Dairymen of Kings County met recently at Hanford to form a county dairymen's association as a department of the farm bureau.

Monterey County reports its huckleberry crop on the hillsides as ready for making huckleberry pies and the quality is exceptionally fine.

The Kings River decreased in flow from 4000 second feet to 900 second feet within a short time, and it is feared the damage to crops will be serious.

At the farm bureau sale in Merced County $18.50 per hundred was paid for two carloads of hogs bought by the Cudahy Company of Los Angeles. This was equivalent to $21.65 Los Angeles market.

University people investigating the trouble affecting the cantaloupe crop of Stanislaus County report that it is not due to insects but to bacterial trouble. The investigation was conducted by Professors Woodworth and Horne.

San Jose has a new cannery in operation, having started July 7. It is claimed that building and appliances called for an investment of half a million dollars. The output will be about 130,000 cases of both fruit and vegetables. The cannery will employ approximately 500 women and girls.

Southern California

Hemet claims over 1000 extra workers in the fruit canneries.

The coming Lima bean crop is reported in 69 per cent condition.

Best apricots have been sold to Redlands canneries for about $80 per ton.

Blythe, Riverside County, recently shipped its first car of honey, netting $3600.

Banning has shipped out practicaly all her apricots to outside sections for canning.

California has approximately 30 mutual insurance companies now in operation.

Ventura County is to hold special election August 26 on $580,000 good roads bonds.

Farmers at Summit Valley report serious depredations by grasshoppers and squirrels.

The San Fernando Cannery is now sending out apricots at the rate of 322 cans a minute.

The Lima bean growers are being paid an additional two cents on last season's delivery.

The San Diego County farm bureau fair will be held at Balboa Park, San Diego, September 24-27.

Lima bean growers of Sawtelle and Inglewood in Los Angeles County have formed a marketing association.

The San Dimas Canyon dam is expected to be at least 50 feet in height in time to retain winter rains.

The farm bureau of Riverside County is encouraging boys and girls to enter into the activities of the pig clubs.

The California Date Association anticipates a harvest of 200,000 pounds of dates in Coachella Valley, Riverside County.

Stockhoders of the Covina Citrus Association have voted a bond issue of $160,000 for improving packing facilities.

The campaign to make permanent the Lima bean pool is being pushed, but there is apparently an organized opposition.

Los Angeles is shipping carlots of potatoes to Albuquerque, Chicago, Des Moines, El Paso, San Antonio and other points.

Ventura County's apricot harvest is much later than other sections. The first delivery at the canneries was made July 18.

Growers on the Huntington Beach mesa are discussing organization of an irrigation district to develop water for about 2500 acres.

A cannery at Riverside burned last week, causing entire loss of the plant and $70,000 worth of canned apricots of the present season's pack.

The Hemet-San Jacinto Growers' Association is paying $30 a ton to growers on delivery of apricots and peaches of canning size, $15 a ton for jam apricots.

A drainage district is proposed to to take in lands of the Patterson Ranch near Oxnard. Bonds will be voted on August 26; $200,000 is the estimated expense.

The California Walnut Growers' Association has made its final distribution of surplus reserve to growers for last season's sales. Ventura County growers received about $11,000.

The Coast and General

The berry harvest of Bellingham, Washington, is at its height.

Cannery at Puyallup, Washington is bidding $10 on cull apples.

Arizona cantaloupes are practically all marketed and at satisfactory prices.

Arizona has 115,000 acres in cotton. About two-thirds of the area is in Long Staple Egyptian.

The business of fruit refrigeration has assumed immense proportions in transcontinental shipments.

Arizona estimates that about 5000 acres are planted to potatoes. This is about the same as last year.

A new pear growing district near El Paso, Texas, is this year making its first shipments, approximately 75 cars.

A party of buyers from Iceland, Denmark, Norway and Sweden has been making tour of the Hood River apple district.

Farmers near Washington state experiment station near Chehalis made their annual pilgrimage to the station, holding picnic and institute.

The Oregon Growers' Cooperative Association signed up at least half the prune acreage in the state at the meeting recently held at Yamhill

Dairymen in Maricopa County, Arizona, figure that they will effect a saving of $20,000 a year on the improved roads which are soon to be built.

The Arizona state land board has withdrawn from entry 18,000 acres about 12 miles south of Wickenburg. A proposed irrigation project will furnish water for this land.

The cherry crop of the Wenatchee Valley of Washington proved to be short of estimates. Only about 65 carloads were shipped. Prices, however, were entirely satisfactory.

A strong effort is being made to have every section of Arizona represented at the International Soil Products Exposition which is to be held at Kansas City, September 25 to October 10.

The ministry of food of Canada is threatening to take entire charge of the food situation again because of profiteering. Dealers are taking advantage of embargo against certain American foodstuffs.

Peaches in carload quantities are now being shipped out of the Salt River Valley. It is only recently that a sufficient number of peaches has come into bearing to justify shipping them out in refrigerator cars, although express shipments have been made for many years. About ten carloads will be shipped out this year.

Heavy rains in the northern part of Arizona have done considerable damage to roads. The Santa Fe Trail across the state from east to west was temporarily put out of commission. The road south to Phoenix was also badly washed. Crews have been put out to repair the damage so they will remain impassable for but a few days.

Carl S. Rousseau, a farmer living north of Phoenix in the Salt River Valley, has produced 45 tons of watermelons on one acre of land. None of these have sold for less than $20 a ton and from that up to $40. One load weighing 6500 pounds was composed of watermelons averaging 43 pounds each. Another shipment of 5400 pounds averaged 45 pounds each.

SPRAYING

Continued from Page 133

cheaper fumigation is the result. Notwithstanding that, for those who have but a small amount of fumigation to do and are not able to use the liquid gas, formulas will be found for the mixtures which will manufacture the gas directly under the tree or in each warehouse or room as needed.

Fungicides

Amongst fungicides are the copper compounds, sulphur, corrosive sublimate, formalin. There are representative formulas of each.

FUNGICIDES

1. Commercial Bordeaux Mixture

Several preparations of this sort are on the market in the form of a paste or dry powder to be diluted with water. Objection is sometimes made to these preparations that they will not remain in suspenslon in water as well as the home-made Bordeaux mixture, but some of them are probably as good or better than the average mixture prepared on the ranch. The commercial preparations are more expensive but more convenlent for use, and are especially of interest to the small grower.

2. Bordeaux Mixture

The formula ordinarily used, the 5-5-50, is entirely harmless when the plant is dormant. It may also be used on some growing plants; others it will kill or greatly injure. It may be used even stronger than the formula given when the plant is dormant, but these proportions are effectlve with most fungus troubles. By the 5-5-50 formula is meant:

(a) Copper sulphate	5 pounds
Stone lime	5 pounds
Water	50 gallons

The weaker solution is

(b) Copper sulphate	3 pounds
Stone lime	5 pounds
Water	50 gallons

If hydrate of lime is used add one-fourth more.

To mix, dissolve the copper sulphate with water in proportion of one pound of sulphate to sufficient water to make one gallon of solution for each pound of sulphate used. The stone lime may be slaked and dissolved in water in the same proportions as the sulphate. This gives convenient stock solutions, every gallon of which contains one pound of lime or of sulphate. To make the mixture from these stock solutions take, say, for the formula (a) above, five gallons of the lime solution which will contain five pounds of stone lime and five gallons of the sulphate solution which will contain five pounds of copper sulphate. Five gallons of each of these two solutions may now be mixed with water by pouring through a strainer into water sufficient to make 50 gallons. Do not mix the solutions before pouring into the water.

3. Bordeaux Paste

The best cure for gum disease.

Bluestone	1 pound
Fresh burned lime	2 pounds

Dissolve the bluestone in one gallon water, usIng wooden or earthen vessel, by hanging it In a sack near the top of the water; slake the lime in about one-half gallon of water. Stir together when cool, making a mixture about the consistency of whitewash. Apply with a brush. May be applied to healthy bark as a preventive. Mix fresh each day or two.

4. Bluestone Copper Sulphate

A soluble compound of copper, the raw material for the preparation of most other compounds of copper. This cannot be used on follage. For dipplng graln use:

(a) Bluestone	1 pound
Water	4 gallons

Dip for 3 minutes. Follow by dipplng In:

(b) Quicklime	1 pound
Slaked in water	10 gallons

5. Bluestone for Wash Water

Bluestone	1½ pounds
Water	1000 gallons

6. Sulphur

For dustlng upon plants for the control of surface mildew, red spider, or other parasites, the fineness of the sulphur is an all important consideratlon. Flowers of sulphur, the finest and fluffiest grade of sublimed sulphur, has been heretofore recommended for application as a dust. At present, however, there are upon the market several brands of extremely finely ground suiphurs which are finer than the best grade of sublimed sulphur and no more expensive. Some of these sulphurs, which have been specially prepared for dusting, are ground to pass a 200-mesh boltlng cloth. These are apt to cake or to clog the dusting apparatus. If three parts of sulphur are thoroughly mixed with one part of hydrated lime, kaolin, or other inert powder, these difficulties may be avoided.

7. Corrosive Sublimate (Bichloride of Mercury)

This is a very poisonous substance and is one of the most powerful of germicides; it is employed to some extent in plant disease treatment. The usual strength is:

Corrosive sublimate	1 ounce
Water	8 gallons,

or 1 part to 1000.

Tablets to make this strength when added to 1 pint of water may be obtained at drug stores. Distilled or rain water should be used; the solution must not be kept in a metal container.

8. Formalin

Formaldehyde vapor dissolved in water in what is usually called the 40 per cent solution is one of the best fungicides and is often used in place of corrosive sublimate. Strength varies with seed to be treated.

(a) Formaldehyde	1 pound
Water	40 gallons
(b) Formaldehyde	1 pound
Water	30 gallons
(c) Formaldehyde	1 pound
Water	12½ gallons

CONTACT INSECTICIDES

The lime-sulphur wash is usually considered an insecticide. It is, however, an excellent fungicide, though where a fungicide only is desired Bordeaux is usually preferred. At full strength it may be used only when trees are entirely dormant.

9. Commercial Lime-sulphur Solution

The growers of the state are being supplied with concentrated commercial lime-sulphur solution of good quality and at reasonable prices. The great bulk of this important pest remedy used in the state is therefore of commercial manufacture, testing between 32 degrees and 34 degrees Baume. It is only necessary to dilute with water before spraying.

For spray on dormant trees dilution of commercial solution is usually at the rate of 1 part commercial mixture to 9 parts water. As a summer spray or when used on trees in full leaf use at rate of 1 to 33.

10. Home-made Lime-sulphur Solution

Stone lime	50 pounds
Sulphur (sublimed or powdered)	100 pounds
Water to make	50 gallons

Heat in a cooking barrel or vessel about one-third of the total volume of water required. When the water is hot add all the lime and at once add all the sulphur, which should previously have been made into a thick paste with water. After the lime is slaked another third of the water should be added, preferably hot, and the cooking should be continued until a clear orange colored solution is obtained (usually 45 to 60 minutes), when the remainder of the water should be added either hot or cold as is most convenient. The bolling due to the slaking of the lime thoroughly mixes the ingredients at the start, but subsequent stirring is necessary if the wash is cooked by direct heat In a kettle. After the wash has been prepared it must be allowed to settle and then be strained through a fine sieve as it is being run into the spray tank. The resultant product is a concentrated solution of lime-sulphur, which should be diluted about six times with water for a winter spray.

11. Sulphur Compounds

For various reasons it is often desirable to mix sulphur and water and apply to plants as a spray. Sulphur, however, is not easily wetted with water and it is a difficult matter to make a uniform mixture of the two. It has been found that a number of substances, soap, glue, dextrin, etc., when mixed with water and sulphur, have the property of counteracting the natural aversion of sulphur to water. Certain of these substances have been used in the preparation of commercial sulphur pastes. These commercial pastes, as now manufactured, contain from 45 to 50 per cent of sulphur in a very finely divided condition, the remainder being water and one of the substances mentioned above. The effect of these pastes is that of dry sulphur. The usual strength to use is:

(a) Commercial sulphur paste	8 to 21 pounds
Water	100 gallons

A satisfactory wettable sulphur can be easily made at home by the use of glue water as follows:

(b) Powdered glue	¾ ounce
Hot water	1½ gallons
Sulphur (flowers or powdered)	5 pounds
Water to make	100 gallons

Dissolve the glue in hot water, or soak over night in 1½ gallons of cold water. Add the glue water to the sulphur a little at a time and work up into a smooth paste as free from lumps as possible. Rubbing is better than stirring. Wash this paste into the spray tank through a fine screen, using the remainder of the glue water to wash it through and a stiff brush to break up the remainder of the lumps. Then add plain water to make 100 gallons.

(c) Make a paste of	
Flour	4 pounds
Water	4 gallons
Mix this with	
Sulphur (sublimed or powdered)	5 pounds
Then add	
Water to make	100 gallons

12. Resin Wash

The old time resin wash is not used as generally as formerly, but is still a favorite with nurseymen, for dipping nursery stock. It is now put up in a commercial mixture with instructions on the container. It is rather expensive but effective.

Resin	20 pounds
Caustic soda (76 per cent)	6 pounds
Fish oil	2½ pints
Water	100 gallons

Put resin, lye and fish oil, with sufficient water to cover them well, into a large iron kettle and heat until all are well mixed and thoroughly dissolved. Add cold or hot water to make when finished 100 gallons of spraying material. This is one of the oldest sprays and very adhesive. Some complain because of this wash closing the pores and preventing proper functioning of the leaves. We have never heard of any injury from this cause.

13. Kerosene Emulsion

Kerosene or petroleum distillates are often used most effectively. There are conditions where greatest care must be observed. For instance, on excessively hot dry days there is danger of either tree or fruit injury. Some experiments with these oils have appeared almost foolhardy but at the same time have accomplished results. For instance, in the California Cultivator of March 22, 1919, page 409, Mr. Calkins referred to spraying pure kerosene over tree infested with wooly aphis and pouring over a quart of the oil about the stripped roots and covering immediately with earth. In citrus orchards especial care must be observed during the hot weather. In the form of emulsions the distillate or low grade kerosene sprays are safer but even then do not allow large quantity to run down trunk and saturate the bark.

Kerosene	15 gallons
Liquid soap	¾ gallon
(Or hard soap)	4 pounds
Water	200 gallons

If liquid soap is available, it is preferable to hard soap, since no heating is required. Hard soap, preferably fish oil, is cut in thin slices and dissolved in hot water. The soap is placed directly In the spray tank with 10 to 15 gallons of water or more (the exact amount is not important), and then the engine is started. The oil is now added slowly, and the materials are emulsified by being run through the pump under pressure. After a few minutes the rest of the water may be added, and the spray is ready to apply to the trees.

Certain "tree" distillates, testing 31 degrees to 32 degrees Baume, said to be selected and partially refined, have lately displaced to a considerable extent the heavier distillates of 27 degrees to 28 degrees for use on citrus trees.

14. Distillate Emulsion

(a) Tree distillate (31 degrees-32 degrees Baume)	4 gallons
Liquid soap	¾ gallon
(Or hard soap)	5 pounds
Water	200 gallons

These materials are emulsified in the same manner as explained for the kerosene emulsion, Formula 13. If the distillate is used without soap, the following is the formula:

For use on deciduous trees the following is recommended:

(b) Distillate 27 degrees-28 degrees Baume)	20 gallons
Fish oil soap	30 pounds
Water to make	12 gallons

Dissolve the fish oil soap in water, heating it to the boiling point, add the distillate and agitate thoroughly while the solution is hot. For use add 20 gallons of water to each gallon of the above mixture.

15. Distillate Emulsion and Tobacco Extract

Water	12 gallons
Fish oil soap	30 pounds
Distillate (32 degrees-34 degrees Baume)	20 gallons

The above emulsion is prepared in the ordinary way as a stock solution. For use in the orchard dilute 1 to 20 parts of water. To every 200 gallons of this diluted spray add 1 pint of tobacco extract containing 40 per cent nicotine, or about 3½ gallons of tobacco extract contalnlng 2¾ per cent nicotine.

16. Crude Carbolic Acid Emulsion

Fish oil soap	40 pounds
Crude carbolic acid	5 gallons
Water to make	40 gallons

The 40 gallons of water are first poured into the cooklng kettle and allowed to boil. While the water is getting hot, the whale oil soap is cut into fine pieces, so as to make it dissolve easily, and added to the water. When the soap is all dissolved in the hot water the carbolic acid is added, and all is allowed to boil for a short time to insure thorough mixing. The whole operation requires less than one hour. This makes about 43 gallons of rich stock solutlon. For spraying the stock solution is diluted 1 to 2[illegible] of water.

COMBINED INSECTICIDES AND FUNGICIDES

Some years ago when W. H. Volck was horticultural commissioner of Santa Cruz County he recommended combined insecticide-fungicide sprays. This is economical for one spraying operation accomplishes two purposes.

The apple is attacked by a number of pests, both fungi and insects. To combat these economically the spray mixture should contain remedies for as many pests as possible.

First spraying, to be applied just as the blossoms are falling or in full bloom, according to locality:

17. Arsenate-Sulphur

(a) Acid arsenate of lead	8 pounds
Milled or atomic sulphur	5 pounds
Dilute Bordeaux mixture to make	100 gallons

Where apple scab is not a factor use water instead of Bordeaux.

Second spraying: apply ten days to two weeks after the first spraying:

(b) Neutral arsenate of lead	6 pounds
Milled or atomic sulphur	3 pounds
Water	100 gallons

Third spraying. Repeat the second spraying formula in about three weeks.

If it is desired to control aphids add one to two pounds of 40 per cent nicotine sulphate.

18. Bordeaux-Arsenate of Lead

Neutral lead arsenate	3 pounds
Bordeaux mixture	50 gallons

Where a stronger poison is desired the arsenate of lead can be increased to four pounds. A more uniform distribution of the arsenate of lead is secured throughout the spray when it is added to the milk of lime instead of placing it in the spray tank.

POISONS FOR CHEWING INSECTS

Paris green has largely been r[illegible]

placed by lead arsenate. If used, however, it is at the rate of one pound to 150 gallons of water. Modern chemistry has made the lead arsenates or zinc arsenite more effective and more economical than Paris green. However at times it may be substituted, especially if preferred in bran mash or other poison baits.

18½. Acid Lead Arsenate (Lead Hydrogen Arsenate, Di-lead Arsenate, often labeled "Standard" or Lead Arsenate. The acid type of lead arsenate contains more poison per pound than the basic type and is a stronger and quicker acting poison. It is, however, somewhat susceptible to the action of other chemicals, particularly those of an alkaline nature (such as soaps, lime-sulphur solution, etc.), and is more or less dissolved by them when used as a combination spray. In the moist climates along the coast, or in continuous damp, cloudy weather elsewhere, whether used alone or in combination with other sprays, some of the arsenic is apt to be dissolved and cause serious foliage injury. It is not considered as a safe arsenical for use on stone fruits, beans or other susceptible plants.

Basic Lead Arsenate (Usually labeled "Tri-plumbic" or "Neutral." The basic type of lead arsenate contains less arsenic per pound than the acid type, and is a weaker and slower acting poison. It is not decomposed, however, by chemicals of an alkaline nature, such as are usually applied with it as a combination spray, nor by the damp weather of the coast regions. It is considered the only safe arsenical to use on stone fruits, beans or other susceptible plants.

The lead arsenates are usually sold as a paste containing about 50 per cent of water, or as a dry powder. The paste should be thinned somewhat with water and worked into a smooth cream before adding to the spray tank. The powder may be added directly to the tank and mixed by means of the agitator.

For codling moth and most defoliating insects, use:

19. Arsenate Paste

(a) Acid lead arsenate paste	4 to 8 pounds
Water	100 gallons
(b) Basic lead arsenate paste	5 to 10 pounds
Water	100 gallons

Dry or powdered lead arsenate contains twice as much arsenic as the paste, therefore use only one-half as much in the above formula.

20. Zinc Arsenite

This is a more active and stronger poison than either type of lead arsenate and is useful in controlling the various caterpillars which are troublesome on pears and apples in the early spring, but is very apt to cause injury if the application is made after the time of full bloom.

Zinc arsenite powder	3 pounds
Water	100 gallons

White arsenic (arsenic trioxide) is only sparingly soluble in water, although sufficiently so to prohibit its use on plants as an insecticide. Its use as a stomach poison is therefore limited to the preparation of poison baits for the control of grasshoppers, armyworms, cutworms, etc., and in some other cases where the insecticide is not to be applied to growing plants.

21. Poison Bran-mash

Bran	25 pounds
White arsenic	1 pound
Molasses (cheap blackstrap preferred)	2 quarts

Mix the arsenic and the bran dry, and add the molasses which has been diluted with water. Add enough water and mix thoroughly to make a dry mash which will broadcast easily.

22. Citrus Bran-mash

White arsenic	1 ponud
Molasses (cheap blackstrap preferred)	2 quarts
Lemons (or oranges)	6 fruits
Water (abbut)	4 gallons
Bran	25 pounds

Mix the above materials as follows: Stir thoroughly the white arsenic, molasses, and water first. Grind the lemons, including the rinds, in a meat grinder, or chop fine, and add to this liquid. Then slowly pour this over the bran and stir thoroughly until an even mixture is secured.

The amount of water to use in the preparation of these baits will vary according to the coarseness of the bran or substitutes. A dry mash is prefcrable to a wet mash because it does not harden under the heat of the sun and remains palatable, while wet mash becomes baked and unattractive. Distribute in small quantities early in the morning.

23. Argentine Ant Syrup

The following formula was recommended by Prof. R. S. Woglum in an article in the California Cultivator of March 30, 1918. It is now generally recognized as a standard for this pest. Prepare a syrup:

Granulated sugar	15 pounds
Water	7 pints
Tartaric acid (crystalized)	¼ ounce

Boil for 30 minutes.
Allow to cool.

Dissolve sodium arsenite (chemically pure)	¾ ounce
In hot water	1 pint

Cool. Add poison solution to syrup and stir well.

Add to poisoned syrup: Honey	1½ pounds

Mix thoroughly.

24. Tartar Emetic for Ants

Simple formula recommended by J. B. Neff and given in Cultivator of October 7, 1916:

Tartar emetic the size of a lima bean in three tablespoons of honey. Mix and place in two or three saucers. and place where ants are proving troublesome.

25. White Arsenate for Ants

Sugar	18 pounds
Water	6 quarts

First dissolve the sugar in the water by stirring, or by heating and stirring, then add one ounce of white arsenic which has been previously converted into sodium arsenate. Add enough water to make exactly three gallons. This formula will produce a syrup containing .2 of 1 per cent of arsenic trioxide by weight.

Use on bits of sponge on small shallow dishes, two or three to a room. Trace back the incoming column of ants and place the poison soaked sponge as near as can be readily determined to the place of entrance.

Sodium arsenate is made by taking sal soda 2 pounds, white arsenic 1 pound, water 1 gallon. Put ingredients in iron or granite ware kettle, not aluminum. Boil 15 or 20 minutes until solution is clear.

DUSTS

26. Sulphur and Lime

As a rule in sulphuring for red spider and other mites and the mildews growers use lime with the sulphur; sometimes equal parts lime and sulphur, sometimes ¾ sulphur and ¼ lime. The more common practice now, however, is to use best grade sulphur in either hand operated or power machines.

The sulphur should be forced over the surface in a cloud of dust and not deposited in large quantity.

27. Dry Arsenate

Use dusting machine or sack of loosely woven material and powder ear of corn as silk begins forming. There are now excellent bellows dusters which give better results than the cloth shaker.

28. White Hellebore

White hellebore	1 pound
Water	50 gallons

Effective against root maggots of potted plants.

29. Tobacco Dust

The tobacco dust may be discharged over tree or plant, but as a rule it is diluted with 50 per cent of either kaolin or hydrated lime.

30. Nicotine for Walnut Aphis

During the last season extensive investigations have been made as to methods of handling two walnut pests. One of these is the aphis and the other is the coddling moth. More definite results have been accomplished, or at least more definite knowledge secured, with the aphis remedy. This has been secured with the use of approximately this formula:

Kaolin	77 parts
Hydrated lime	21 or 22 parts
Nicotine sulphate (40 per cent)	1 or 2 parts

The preparation of this mixture has been entirely handled by experts of the state university and the Walnut Growers Association, and the ready-to-use mixture delivered to walnut growers has been applied usually by the use of power machines.

31. Nicotine-Arsenate

Kaolin (about)	67 parts
Hydrated lime (about)	16 or 17 parts
Nicotine sulphate (40 per cent)	1 or 2 parts
Dry arsenate of lead	15 parts

FUMIGATION

32. Hydrocyanic Acid Gas

Fumigation practice has undergone radical change within the past two years. While the former method of manufacturing gas under the tent in earthen vessels is continued to a limited extent the greater part of orchard fumigation is now accomplished through the use of liquid hydrocyanic acid gas. This is delivered direct from the factory to the orchard in containers, and pumps adapted to forcing this liquid gas under the tent in the form of a spray, with graduated gage indicating exact dosage, have been invented and are now in regular use. The new process has the advantage of giving more complete kill, practically without injuring the tent and with less danger of injury to the tree, and with it all it is fully as economical as the old method. More than ever the process is one for the expert. Most satisfactory work seems to be done by cooperative organizations of neighborhood growers. Excellent work is also being done by contract fumigators. There is no formula to be given for this process for it is simply the forcing into the tent of the liquified gas. In this issue is given chart showing dosage for various sized trees; chart devised by Prof. R. S. Woglum.

For those who understand handling this deadly gas we give formula which may be used in manufacturing gas either for orchard trees under tent or for fumigating rooms, this dosage for every 100 feet of space. For warehouse stronger dosage may be used if preferred.

Sodium cyanide	1 ounce
Sulphuric acid	1½ fluid ounces
Water	2 fluid ounces

The acid and water are mixed in the vessel and the cyanide dropped in at the last moment.

33. Carbon Bisulphide

Carbon bisulphide is a liquid which evaporates quickly when exposed to the air, forming a heavy and inflammable vapor of great penetrating power. In using the material for fumigation it is essential that it be placed at the top of the room in a shallow container in order that the heavy vapors as they are driven off will thoroughly diffuse with the air contained in the space to be fumigated. The proper amount to use depends upon the type of room being fumigated and ranges up to about 30 pounds to 1000 cubic feet in ordinary rooms where the walls and floor have not been made especially tight. The best results are obtained by doing this work when the temperature is above 75 degrees Fahrenheit.

MISCELLANEOUS

There have been several sprays for weeds, and the grower has continually sought for something which would be effective on such troublesome weeds as morning glory, but as a rule the best weed destroyer is a sharp weed knife or weed cutters on the cultivator. However, some may wish the formula for use of sulphate of iron on mustard of grain fields; also for the arsenicals for morning glory and other pests. Here are the proportions:

34. Sulphate of Iron for Weeds

Many weeds are susceptible to a spray of sulphate of iron and some, especially mustard, are so sensitive to it that spraying a grain field will often eradicate the mustard and still leave the grain growing lustily. A very strong solution is used:

Sulphate of iron	100 pounds
Water	50 gallons

Dissolve by constant agitation.

35. Arsenic-Caustic Soda for Weeds

Caustic soda (sodium hydroxide), or a good grade of concentrated lye, is much more active in dissolving arsenic than either sal soda or soda-ash, and much less is required, although the cost per pound is greater. Very little heat is required in the preparation of sodium arsenite by means of these materials. If made in large quantities (five gallons or more) the use of heat is unnecessary.

Granulated Caustic Soda (98 per cent)	10 pounds
White Arsenic (arsenic trioxide, 99 per cent)	20 pounds
Water, to make	5 gallons

Dissolve the caustic soda in about 2 gallons of water in a metal or wooden vessel (preferably iron), and while still hot add the dry arsenic, about a pound at a time at a sufficient rate so that the solution is just at the point of boiling, but does not actually boil. Stir continuously during the addition of the arsenic and until all is dissolved. Considerable heat is produced by dissolving the caustic soda. Additional heat is furnished by the chemical reaction involved in the union of the caustic soda with the arsenic to form sodium arsenite. After all the arsenic is dissolved let the solution cool and add water to make exactly five gallons.

(Caution.—Do not add cold water to the hot solution. An explosion may result as the solution is hotter than the boiling point of water.)

36. Torch for Dodder

Dodder, a most perplexing pest of alfalfa and other crops, may be controlled by the use of a gasoline torch burner. The kind with a chamber for compressed air and of large capacity is necessary. After cutting alfalfa, use the torch over infested spots in the field.

37. Tree Whitewash

In order to prevent sunscald whitewashing the trees or protecting by shade is at times necessary. Where a tree has been severely cut back or where a protecting limb has been broken off apply to the exposed limbs and trunk the following, known as California tree whitewash:

(a) Quicklime	30 pounds
Tallow	4 pounds
Salt	5 pounds
Water enough to make the mixture flow freely.	
(b) Waterproof Whitewash.	
(1) Quickline	62 pounds
Water (hot)	12 gallons
(2) Common salt	2 pounds
Sulphate of zinc	1 pound
Water (boiling)	2 gallons
(3) Skimmed milk	2 gallons

(1) Slake the lime thoroughly; (2), dissolve the salt and sulphate of zinc in the two gallons of water; pour (2) into (1) and add (3). Mix thoroughly. Two pounds of flour paste (dissolve in two gallons of hot water) may be added instead of the skimmed milk.

38. Lasting Whitewash

The formula 35 is perhaps the best tree whitewash, but where one wants one quickly made which is fairly durable, it may be made simply of quick lime, water and salt.

Quick lime	5 pounds
Salt	½ pound
Sulphur	¼ pound

Slake the lime slowly with water and add the salt and sulphur while it is boiling. Add enough more water to make a good wash.

39. Tree Barriers

Use the commercial tree tanglefoot, or if preferred mix as follows:

Mix with a gentle heat one pound of resin and one gallon of castor oil, and when cold thin as desired with more castor oil. One of the best ways to apply it is to saturate a piece of baling rope with the well thinned mixture and tie around the trunk of the tree. This will remain sufficiently sticky about ten days, as long as anything of the kind we know of. A strip a few inches wide surrounding the tree trunk, placed in the fall and tended during the winter will prevent the ascent of the cankerworm moth. Placed in hop vines it prevents ascent of the hop flea beetle. Will bar Argentine ants or most other insects that reach the foliage by crawling only.

Cotton Bands. A four inch strip tied around the tree by a string at the lower edge, and the top then pulled down over the string is in use against Fuller's rose beetle on the orange, and other beetles and worms.

40. Asphaltum

Melt asphaltum and paint while

The LAUSON Wins Again

The position of the driver's seat is adjustable and a riding spring makes it easy for you to drive your LAUSON all day without feeling fatigued. Notice there is both a rigid and swinging draw bar.

at Newell, South Dakota.

Five selected tractors were entered in a plowing contest on the farm of C. A. Gerlach, Newell, S.D., and honors *again* went to the LAUSON on the following counts—

First in performance in the field—
Best job of plowing—
Ease of operation—
Least fuel consumption—

This is the kind of "showdown" the LAUSON always makes in actual field operation. Results are equally good on belt work and hauling.

You cannot afford to buy *any* tractor until you have a LAUSON demonstrated on *your* farm. New literature just off the press tells why the LAUSON is **"The Pattern Tractor of the Industry."**

The Famous Hardie Junior is a Real Power Sprayer

It has sufficient capacity for two lines of hose. It has plenty of power for high pressure effective spraying. It is little in first cost, engine power, pump capacity and ability to do successful spraying. We believe this is the greatest small power sprayer ever manufactured, and placed on the market with phenomenal success in every fruit section in United States and vouched by thousands who own the Famous Hardie Junior. Equipped with one and one-half horsepower engine, battery ignition, 150-gallon tank with mechanical agitator, capacity of four gallons per minute with a steady working pressure of 200 pounds, and two 25-foot of the best spray hose, fitted with spray rods and nozzles; 4-inch tire truck with pole or shaft.

All for $330. *Delivered anywhere in this state*

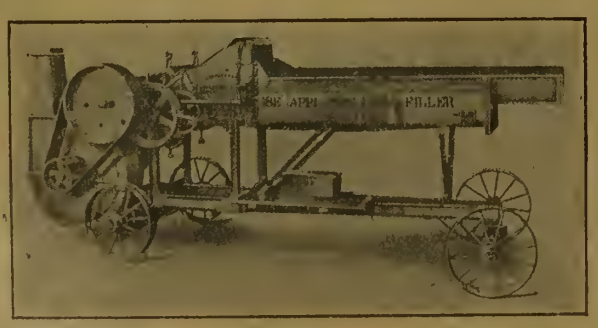
If truck is not needed, deduct $55.00.
These prices are subject to change without notice. The wise buyer will place his order now.
This low price is made possible by big production.
If you are interested in other types and sizes of the HARDIE POWER SPRAYER write us for the big spray catalog, and learn why we can offer more spray pump value than any other spray pump manufactured.
The HARDIE ORCHARD GUN is now $12.00, none better, every one guaranteed to give satisfaction to the user or his money refunded. The Hardie spray hose is the safest hose to buy.

The Hardie Manufacturing Co.

224 N. Los Angeles St., Los Angeles

Appleton Silo Filler

2 Sizes 18 inch and 26 inch feed



Cuts Hay and all Green Stuffs

We Guarantee

that under the same conditions as to speed and power applied, condition of fodder, etc., the APPLETON SILO FILLER will do MORE and BETTER work, size for size, than any other silo filler on the market; that it is simpler of construction, easier and safer to feed, and requires less power for successful operation.

Immediate Deliveries

C. S. ANTHONY

TRACTORS—TRUCKS—FARM MACHINERY
221 N. Los Angeles St., Los Angeles, Cal.

heated in four inch strip around crown of tree, clearing away soil six or eight inches. The ground should be cleared and afterwards filled back against the asphaltum.

41. Potato Bait

Wireworms which have become a serious pest in bean fields and with many of the garden or truck crops may be controlled to an extent by placing potatoes in the hill with the beans. After a few days these are lifted and the wireworms which have been attracted to the potatoes may be shaken into oil or other liquid and destroyed. The potatoes are located by cloth which is attached and shows above surface of the ground. It is claimed the cost of this treatment is not over $5.00 or $6.00 per acre.

42. Poisoned Barley

Following is the latest government formula for preparing poisoned barley for California ground squirrels:

Barley (clean grain)	16 quarts
Strychnine (powdered alkaloid)	1 ounce
Bicarbonate of soda (baking soda)	1 ounce
Thin starch paste	¾ pint
Heavy corn syrup	¼ pint
Glycerin	1 tablespoon
Saccharin	1-10 ounce

Mix thoroughly 1 ounce of powdered strychnine and 1 ounce of common baking soda. Sift this into ¾ pint of thin, hot starch paste and stir to a smooth, creamy mass. (The starch paste is made by dissolving 1 heaping tablespoon of dry gloss starch in a little cold water which is then added to ¾ pint of boiling water; boil and stir constantly until a clear thin paste is formed.) Add ¼ pint of heavy corn syrup and 1 tablespoon of glycerin and stir thoroughly. Add 1-10 ounce of saccharin and stir thoroughly. Pour this mixture over 16 quarts of clean barley and mix well so that each grain is coated.

(Caution: All containers of poison and all utensils used in the preparation of poisons should be kept plainly labeled and out of reach of children, irresponsible persons and live stock.)

APPLES, PEARS AND QUINCES

Insect Pests

Aphis, Green (Aphis mali). Apply 9 or 10 just before buds open, if orchard has been badly infested in past years. Apply 29, as soon as the insects make their first appearance.

Aphis, Leaf-Curling (Aphis sorbi). 9 or 10 plus nicotine sulphate, one pound to 100 gallons. Apply when the buds are beginning to open, pink showing in a few blossoms; spray very thoroughly.

Aphis, Wooly (Schizoneura lanigera). Spray with 15 whenever this pest appears above ground. Use at least 150 pounds pressure. For underground forms proceed as follows: Remove soil until upper roots are exposed at the base of the tree. Pour several gallons of 15 or solution of nicotine sulphate around crown and replace soil when it has soaked in. Repeat often.

Bud Moth (Lithophane antennata). Use 9 or 10 in winter and 17 before leaf buds open and after blossoms fall. Repeat every ten days if necessary.

Brown Apricot Scale (Lecanium corni). Apply 13, 14 or 15 just as soon as leaves fall. Applications should be made before December 1.

Canker Worms, Fall Canker Worm (Anesopteryx pometaria Harris). Spring Canker Worm (Paleacrita vernata Peck). Apply 19 when worms first appear. Spray as often as needed. Tanglefoot bands on the trees are very effective in keeping the caterpillars from the trees.

Codling Moth (Cydla pomonella L.). Apply 18 or 19. Continue to spray at intervals of ten days or two weeks throughout the season (at least four times).

Greedy Scale (Aspidiotus camelliae). Apply 9, 10 or 14 when trees are dormant. This scale seldom needs treatment.

Oyster Shell Scale (Lepidosaphes pomorum). Apply 9 or 10 when trees are dormant.

Pear Slug (Caliroa cerasi). Dust on Paris Green or pyrethrum.

San Jose Scale (Aspidiotus perniciosus). Apply 9 or 10 when trees are dormant. If 9 is used follow instruction of manufacturer, or approximately 1 to 9. Repeat in spring.

Tussock Moth. Spray in full bloom with 20, 6 pounds to 200 gallons, and follow in ten days with neutral lead arsenate, 15 pounds to 200 gallons.

Fungoid or Bacterial Diseases

Apple Mildew. Cut off infested tips both winter and summer, also prune back all twigs somewhat as apricots are pruned. Spray with arsenites and Bordeaux combined.

Bitter Rot (Glomeralla ruformaculans). Apply 1 or 2 (b) at first appearance of rot. Repeat every two weeks if needed.

Black Spot Canker (Myxosporium curvisporum Sacc.). Apply 2 (a) the first and fifteenth of November.

Moss or Lichens. Apply 1 (a), 2 (b), 9 or 10 when trees are dormant.

Pear Blight — No spray effective. The only treatment consists in cutting off blight as fast as it appears. Cut below affected parts so that good live wood is secured. Sterilize implements after each cut by dipping them in 7.

Powdery Mildew (Podosphaera oxycanthae). Apply 1 or 2 (a) when trees are dormant, then 2 (b) during spring and early summer. Remove mildewed tips in winter. Apply 9 or 10 just before buds open.

Sappy Bark. Cut away diseased parts when trees are dormant.

Scab (Venturia inaequalis, Winter). Apply 1 or 2 (b) before buds start. Spray again with 2 (b) as soon as blossoms fall. Repeat several times at intervals of three or four weeks. (This should be done especially if the weather is damp.)

CITRUS FRUITS

Insect Pests

Army Worms (Various species). Apply 21 or 22 under trees; also if they have not already secured access to orchard, surround trees with deep furrow, vertical side toward trees. If cover crops are growing, remove such growths as project up into branches of the trees. Paint tanglefoot bands around tree trunk. (See 39).

Black Scale (Saissetia oleae) Fumigate with 32 during period between September 1 and January 1. Spray young trees with 12 or 14 during the months of September, October and November. Remove nightshade from orchard before fumigation to prevent reinfection. Fumigate also olive trees or oleanders which may be near your orchard.

Chaff Scale (Parlatoria pergandii). Fumigate with 32 at any season.

Coccus citricola. This has become a serious pest in past few years. Treatment given is generally fumigation (Formula 32) though some continue using commercial sprays.

Fuller's Rose Beetle (Pantomorus fulleri). This insect cannot fly and can be kept from the tree by means of tanglefoot bands.

Hemispherical Scale (Saissetia hemispherica). Same as for Black Scale.

Long Scale (Lepidosaphes gloverli). Fumigate as soon as found with 32. Repeat if living forms are found a month later.

Mealy Bugs: Long Tailed Mealy Bug (Pseudococcus longispinus); Citrus Mealy Bug (Pseudococcus citri); Fumigate as soon as found with 32 applied as follows: Give regular dose and at the end of one hour's exposure repeat the dose and expose for another hour, thus making the dose twice 32 and the entire exposure two hours. The state insectary, Sacramento, will distribute colonies of cryptolaemus and other beneficial insects which have proven remarkably efficient in keeping down the citrus mealy bug.

Orange Aphis (Aphis gossypii glover). Spray with 14 or 15 as soon as found.

Purple Scale (Lepidosaphes beckii). Fumigate with 34 as soon as located and repeat in one month if necessary.

Red Scale (Crysomphalus aurantii). Treat same as Purple Scale.

Red Spider (Tetranychus mytilaspidis). Apply finely ground or flowers of sulphur (see 6) if by hand or knapsack type of machine, pure sulphur without diluent such as hydrated lime or kaolin; if by power machine, ¼ lime may be used. Some prefer spraying with commercial lime-sulphur. It is now believed that very light application of the dust, repeated at frequent intervals, gives much better results.

Fungoid and Bacterial Diseases

Brown Rot (Pythiacystis citrophthora). Sow cover crop in orchard. Plow under in spring and cultivate well under the trees. In fruit washer use 5, bluestone, or permanganate of potash. Eliminate infected fruit and disinfect boxes and picking sacks.

Dieback (Bacterial). Improve physical condition of trees by deeper and more thorough tilling of soil. If excessive applications of nitrogenous fertilizers have been made, discontinue until tree has resumed normal conditions.

Gum disease, formerly considered a physiological trouble, now best treated by raking away dirt from trunk of tree, scraping off all diseased bark or tissue and painting with 3.

Mottle Leaf (Physical). Improve physical condition of tree by deep culture. Make applications of lime and manure to soil. Examine soil as to hardpan, and if it exists, break up if possible.

Smut (Meliola camelliae, Sacc.). A fungous growth caused by honey dew exuded by scale insects, plant lice and white fly. Remove pest and smut will disappear.

Wither Tip (Colletotrichum gloeosporioides, Penz.). Apply 1 or 2 (b) as soon as it appears and repeat as often as necessary.

DATES

Marlatt Scale. (Phoenicococcus marlatti). Dip young plants or spray old ones with a solution of phenol.

Parlatoria Scale. (Parlatoria blanchardi). Most effective treatment burning with gasoline torch.

OLIVE

Insect Pests

Black Scale. Best treatment, fumigation with 32 October-January. If sprayed use 12, 13 or 14. Annual spraying not effective. When young insects appear in large numbers on leaves and stems apply spray. Two or three sprayings may be necessary in some years; in others none.

Twig Borer. (Polycaon confertus). Cut off twigs and prune.

Fungoid and Bacterial Diseases

Dry Rot of Fruit. Keep trees free from other pests, well pruned out so as to admit light and air.

Olive Knot. A bacterial disease in the form of a woody tumor. Attacks most vigorous trees. Distributed principally by pruning tools. After pruning dip tools in 7. Cut off all tumors, removing the entire twig when possible, and burn.

Peacock Leaf Spot. (Cycloconium oleaginum). Fungus on leaves and fruit. Spray with 1 or 2 (a).

PEACH, NECTARINE AND APRICOT

Insect Pests

Aphis, Black Peach (Aphis persicaeniger). For those above ground use 29. Destroy the underground forms by pouring carbon bisulphide into holes in the ground (made by a crowbar) six inches to six feet away from the tree and about two feet apart. Pour 15 around base of tree often.

Apricot Scale (Eulecanium armeniacum). Apply 13, 14 or 15 just as soon as the leaves fall. All applications should be made before the first of December.

Black Scale (Saissetia oleae). Same treatment as Apricot Scale.

Borer, Peach Tree (Sanninoidae pacifica Riley). Dig out and kill, or destroy by inserting a flexible wire into their burrows and apply 37, 38 or 40.

Bud Moth (Lithophane antennata). Use 9 or 10 during winter months when tree is dormant. Use 18½ just before leafbuds open and just after blossoms fall. Repeat every ten days if necessary.

San Jose Scale (Aspidiotus perniciosus). Spray with 9 or 10 when trees are dormant.

Twig Borer (Anarisa lineatella). Spray with 9 or 10 when buds are swelling.

Fungoid and Bacterial Diseases

Blight, Peach (Coryneum beyerinkii). Spray last of November or before December 15 with 1 or 2 (a) or 9 or 10.

Curl Leaf (Exoascus deformans, Fuckel). Spray thoroughly with 1 or 2 (a) in spring before blossoming. Later sprayings should be made with 2 (b).

Shot-hole Fungus (Coryneum sp.). Spray with 1 or 2 (a) about ten days before buds open and with 2 (b) when fruit is about one-fourth grown.

Diseases such as little leaf, exanthema, dieback, mottled leaf, rosette, bitter pit, dry rot, blossem-end rot in which the cause is not known and which seem unlike the usual effects of unfavorable conditions or parasites. Most of these troubles show a relation to soil conditions and occur especially in dry, sandy, gravelly, or hard pan soils, those very deficient in humus, or under conditions of irregular soil moisture. Trees standing over old barnyards or corrals or where excessive amounts of manure have been applied are also likely to show some of these conditions. The best possibilities of treatment lie along the line of increasing the humus content of the soil by means of green manure crops and mulches, breaking up all hard pan and plow soles, more careful irrigation to insure the maintenance of a proper and uniform moisture condition of the soil down to a depth of several feet, and throughout the season until rains occur, and planting of alfalfa in orchards where plenty of water is available. The soil in areas where these troubles occur should be examined for alkali or other injurious substances. Where any of these diseases are serious and persistent it may be better to grow some other crop than to keep on with one which is seriously affected.

CHERRIES, PRUNES, PLUMS

Insect Pests

Cherry Slug (Caliroa cerasi). Feed upon the upper surfaces of the leaves exposing the veins. Spray with 18½ or 19.

Prune Aphis (Aphis prunifolii). Spray in the fall with 9 or 10 and as soon as the lice appear with 29.

Black Peach Aphis (Aphis persicaeniger Sm.). See same under Peach.

California Peach Borer (Aegeria opalescens). See same under Peach.

Canker Worm (Paleacrita vernata and Alsophila pometaria). See under Apple.

Tent Caterpillar (Malacosoma disstria). See under Apple.

Brown Day Moth (Pseudohazis eglanterina). Attacks particularly the prunes and cherries. Spray with 18½ or 10 or apply 21 under tree.

Red Hump (Schizura concinna). Spray early with 18½ or 19. Burn cocoons.

Fungoid and Bacterial Diseases

Brown Rot or Fruit Mold (Sclerotinia fructigena Sch.). Produces a rot on the fruit. Spray with 1 or 2 (a) early in the spring, and with 2 (b) as soon as the buds begin to open.

Leaf Curl or Witches Broom (Exoascus cerasi Fuckel). Cut out and burn infested parts. Spray with 1 or 2 (a) early, and with 2 (b) as soon as the buds begin to swell.

Leaf Spot or Shot Hole Disease (Cylindrosporium padi Karst). Produces a shot-hole effect upon the leaves. Spray in early spring with 1 or 2 (a), when the buds begin to open with 2 (b) and when the fruit is one-fourth grown with 2 (b).

Powdery Mildew (Podosphaera oxycanthae DC.). Appears on the leaves late in the season. Spray as soon as found with 26 and repeat if necessary.

Crown Gall (Pseudomonas tumefaciens Erw. Smith and Town). If on young trees recently set from nursery, remove and burn. If the bearing trees, chisel away until only the healthy wood remains. Paint with 3. Watch for a reappearance and treat as before.

Gummosis. Dig out the gum pockets and wash out with 1, 2 (a) or 3.

NUTS

Insect Pests

Aphis. Walnut aphis has developed as a major pest within the past two years. Its successful handling is largely in the hands of the professional. Dusting with nicotine sulphate diluted with kaolin or hydrated lime is the usual practice. This business has developed until the Walnut Growers' Association has a plant for the mixing of these substances which are applied with large powered blowers or dusting machines. For the small grower who wishes to treat immediately apply 30.

Red Spider of Almonds. Apply 9 or 10 summer mixture, or, perhaps better, 6.

Codling moth of walnut. Apply 31.

HYATT
ROLLER BEARINGS
For Bigger Crops
THERE is no reason for any letup in our big agricultural program. Conditions vouched for by the Department of Agriculture warrant a sustained production of crops for which good prices are assured.
The greatest single factor today in making possible increased crops at a lower cost of production is the farm tractor.
Hyatt Bearings in tractors and other farm machinery make it possible for a man to get greater results with less labor. In addition, Hyatt Bearings are used in such farm machinery as grain binders, threshers, plows, windmills, etc.

SPECIAL
TREES
For Replanting

We have a limited number of large Valencia Late Orange trees balled with extra large balls of earth that are just what you need for replanting the misses in your orchard.

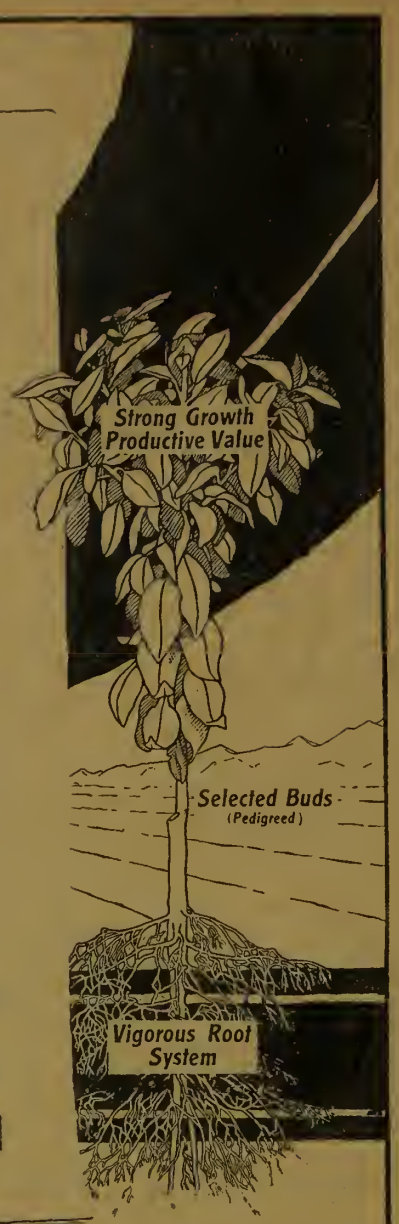
Ready For Immediate Delivery

Get what you want before they are all gone.

Our stock of yearling Navels, Valencias, Lemons and Pomelos in bud selected trees is complete and the best that can be grown.

Let us figure with you on your requirements.

The R. M. Teague Citrus Nurseries
San Dimas, California
Founded in 1889



HERE is the tractor of utmost economy, the tractor that gets most from every gallon of fuel because the direct drive from motor to both rear axle and belt pulley saves power.

THE HUBER Light Four

is the right sized tractor for every sized farm. It is powerful enough to pull three 14-inch bottoms and turn an acre an hour, and light enough to work on plowed ground without packing it down.

Thousands of Huber Light Fours are in successful use. It is the tried and proved tractor. Huber owners are Huber boosters. For 40 years Huber has built steam tractors; and for 20 years gas tractors. The Huber Light Four is the best tractor Huber ever built.

It plows, harrows, drills, pulls a binder—does every type of heavy field and belt work *economically*. So simple a boy can run it, and anyone who knows an automobile can keep it in repair.

Every one interested in tractors should read the "Tractor in the Making," a reprint in booklet form. Tells vitally interesting facts about tractors. It is free for the asking. *Write for your copy today.*

Weight 5,000 pounds; pulls three 14" bottom plows; 12 h. p. delivered to the drawbar; 25 h. p. at the belt; Waukesha four-cylinder motor; Perfex Radiator; Hyatt Roller Bearings; burns gasoline, kerosene or distillate; center draft; two speeds, 2½ and 4 miles per hour.

THE HUBER MFG. CO., Marion, Ohio

THE HUBER TRACTOR SALES CO.
1012-14 So. Los Angeles St. Los Angeles, Cal.
Some territory open for live dealers.

When writing advertisers, mention The Cultivator.

Fungoid and Bacterial Diseases

Crown Gall. If young trees, dig up; if older, chisel to healthy wood and paint with 2.

Dieback. Physical disturbance. Correct soil conditions.

Blight. Sprays ineffective. Plant resistants.

GRAPE

Insect Pests

California Root Worm (Adoxus obscurus L.). A black beetle whose larvae attack the leaves, stems, petioles, roots and fruit of the vines. Cultivate deeply around the base of the vines. Spray with 18½ or 19 as soon as beetles appear.

Erinose (Eriophyes vitis). This so-called disease is produced by a small mite, which is characterized by forming swellings upon the upper surfaces of the leaves. Dust plants lightly with 6 when they are wet with dew.

Flea Beetle (Haltica carinata Germ.). It infests the foliage and may be handled by spraying liberally with 18½ or 19.

Grape Leaf Folder (Desmia funeralis Hub.). The larvae roll themselves up in the leaves which they eat. Spray with 18½ or 19.

Grape Phylloxera (Phylloxera vastatrix). Attacks roots and foliage of the vines. Plant resistant stock. Be sure of your nursery stock. When possible long continued flooding of fields is beneficial.

Grasshoppers. (See under Beans).

Hawk Moth (Philampeles achemon Drury). The large green larvae of this moth feed upon the foliage. Hand pick, or if too numerous spray with 18½ or 19.

Nematode Root Gall (Heterodera radicicola Mull.). A minute worm attacking the small roots. Destroy all infested vines. Sterilize soil with heat or 33. Plant only hardy varieties where this exists.

Vine Hopper (Typhlocyba comes Say). Infests foliage of the vines. Use hopperdozer in spring before adult females deposit their eggs. Spray as soon as the young begin to appear with 13, 14 or 15.

Fungoid and Bacterial Diseases

Powdery Mildew (Uncinula spiralis and Uncinula necator Schw.) Grows upon the canes, leaves and fruit. Dust often with 6 as soon as the disease appears. Spray early with 1 or 2 (a).

Downy Mildew (Peronospora viticola DB.) Attacks all green portions of the plant — leaves, young shoots, and berries. Spray with 1 or 2 (b) as soon as first appearance.

BLACKBERRIES, RASPBERRIES, LOGANBERRIES, STRAWBERRIES

Insect Pests

Rose Scale (Aulacaspis rosae Bouche). A white scale thickly infesting the canes just above the surface of the ground. Spray with 13, 14 or 15.

Strawberry Plant Louse (Myzus fragaefolii Ckll.). A light yellow louse attacking the buds, blossoms and young fruit. Spray with 13 or with 15.

Fungoid and Bacterial Diseases

Orange Rust (Gymnoconia peckiana Tranz.). Forms orange-red colored masses on the leaves, which finally kill the plant. Dig out and burn all diseased plants as soon as rust first appears.

Leaf Spot on Blackberry and Raspberry (Septoria rubi West.). Produces small pale spots on the leaves. Spray with 1 or 2 (b) when leaves are half grown and repeat every two weeks if necessary.

Leaf Spot of Strawberry (Mycosphaerella fragariae Lind.). This disease first appears as small discolored spots upon the leaves which destroy the tissues of the plant. Spray before the flowers open with 1 or 2 (b). If the disease appears late, mow off and burn the leaves. Spray the newly appearing leaves with 1 or 2 (b).

Powdery Mildew of the Strawberry (Sphaerotheca humuli). Produces a whitish powdery covering on the foliage which soon kills the plant. Dust with 6.

Crown Gall (Pseudomonas tumefaciens Erw.). Affects, especially, the blackberry. Dig vines as soon as this trouble appears; there is no cure. Secure new, clean stock and plant on fresh ground.

CURRANTS AND GOOSEBERRIES

Insect Pests

San Jose Scale (Aspidiotus perniciosus Comst.). A small scale infesting the stalks. Spray when dormant with 9 or 10.

Currant Stem Borers (Sesia tipuliformis and Chrysobothris femorata). Small white larvae which bore into the stalks of the plants. As a preventive, wash plants in the spring with strong soap solution.

Imported Currant Worm (Nematus ventricosus Klug.). Attacks the leaves in the spring. Dust plants with white hellebore when they are wet, or spray with 15.

Leaf Hopper (Empoasca albopecta Walsh). Usually appears in great numbers on the undersides of the leaves. Spray with 13 as soon as the first ones are noticed.

Currant Leaf Louse (Aphis ribis). Usually works upon the ends of the tender shoots and stunts their growth. Spray with 13 or 15.

Fungoid Pests

Leaf Spot (Septoria ribis Desm.). Produces large pale spots with brown borders upon the leaves. Spray with 1 or 2 (b) as soon as first spots appear and repeat as often as is necessary to keep down the disease. Spray with 2 (b) twice after fruit has been removed.

Anthracnose of Currant (Pseudopeziza ribis Kleb.). Produces small brown spots upon the leaves, petioles, young canes, fruit stalks and fruits. Spray with 1 or 2 (a) before leaves appear and with 2 (b) while leaves are unfolding and repeat every three weeks until fruit ripens.

Gooseberry Mildew (Sphaerotheca morsuae B. & C.). Produces a mildew upon the stems, leaves and particularly upon the berries, causing them to spoil. Spray with 2 (b) just as the buds are breaking open and repeat every 12 days until about July 1. Spray plants in winter with 9 or 10.

PEAS, BEANS, VETCH, CLOVER, ALFALFA

Insect Pests

Alfalfa Weevil. Not yet in California. About the only treatment is dragging the field with brush drag. The fight is still with the California plant quarantine officers.

Wireworms (Various species). Affect beans and many other garden plants. Rotation of crops to starve out the infestations is perhaps the best treatment. Where this cannot be done, the use of carbon bisulphide in sandy ground is advised. Fertilize with nitrate of soda or kalnit. Also use 41.

Bean Aphis (Aphis rumicis L.) Works on the leaves, young shoots and tender pods causing much damage. It is usually cared for by an internal parasite and by a predaceous ladybird, (Scymnus sordidus), but if it becomes too destructive spray with 13 or 15.

Green Pea Aphis (Nectarophora destructor Johns). Also attacks ve geraniums, malva, and many other plants. Spray with 13 or 15.

Cut Worms (Peridroma saucia, Agrotis ypsilon). Do great damage to all crops at certain seasons. Plow around field so as to have straight side of furrow next to the crop. Poison with 21 or 22.

Grasshoppers (Various species). Are very difficult to handle. Poisoned baits as given in 21 or 22 have given good results. Fall plowing of breeding grounds essential.

Bean Weevil (Acanthoscelides obtectus Say). Pea Weevil (Lario pisorum L.). Fumigate seed with 33 and be sure that no infested seed is planted. Test by placing in water; infested seeds will float.

Fungoid and Bacterial Diseases

Beau Anthracnose (Colletotrichum lindemuthianum B. & C.). Produces brown sunken areas upon the pods. It also attacks the young plants. Treat seeds with 8 before planting. Spray with 1 or 2 (b) as soon as young seedlings are well under way. Repeat if necessary. Practice clean cultural methods.

Bean Blight (Bacillus phaseoli). Attacks pods and produces wrinkled and distorted seed. Treat seed with 8 before planting.

Rust (Uromyces appendiculatus Lev.). Produces rust colored spots on

1. One of the problems confronting the prune and apricot growers is the successful control of the scales, which indirectly cause the fruit to become black, smutty and inferior.

2. I have worked a number of years manufacturing crude oil emulsion. I have had in mind an emulsion which would emulsify in hard water, if necessary, to be of exceedingly fine particles in order to insure great covering power, to have strong capillarity so that the emulsion will draw itself in under the scale moss and lichens; to have killing power in every drop and the last drop in the barrel to be as good as the first. I have made a good many improvements in the manufacture of emulsions. These improvements which I have made in Crude Oil Emulsions I have perfected during the past season and the emulsion is to be sold under Ortho Crude Oil Emulsion.

3. I desire particularly to call attention to our Dry Bordeaux Mixture, which I have processed to insure freedom of soluble copper and also to be free from grit which wears out spray pumps.

W. H. Volck,
Director of Research

California Spray Chemical Co.

ARCADIAN
Sulphate of Ammonia

A ton of ARCADIAN Sulphate of Ammonia carries more plant food than a ton of any other nitrogenous fertilizer.

ARCADIAN Sulphate of Ammonia is for sale by: CALIFORNIA: San Francisco; Hawaiian Fertilizer Co., Pacific Bone Coal & Fertilizing Co., Pacific Guano & Fertilizer Co., Western Meat Co., California Fertilizer Works, Los Angeles; Pacific Guano & Fertilizer Co., Pacific Bone Coal & Fertilizing Co., Agricultural Chemical Works, Hauser Packing Co. OREGON: North Portland; Union Meat Co.

For information as to application, write

The Barrett Company
Agricultural Department
510 First National Bank Bldg.
BERKELEY, CALIF

To keep thoroughly posted subscribers should read every advertisement in the California Cultivator columns.

foliage. Spray with 1 or 2 (b). Burn all infested plants.

Downy Mildew (Phytophthora phaseoli Thax.). Turns foliage dark and causes it to wilt and die. Select clean seed. Spray with 1 or 2 (b).

Downy Mildew of Alfalfa (Peronospora trifoliorum). Spray with 1 or 2 (b) or dust with 6.

Pea Mildew (Erysiphe polygoni DC). Appears early and late, covering plant with a white felt-like powder. Spray with 1 or 2 (b) or dust with 6.

Dodder. Dodder usually comes because of infested seed at planting time. However, where irrigation waters are from gravity flow from mountain streams the seed may be introduced by them. Where patches appear in alfalfa burn by piling straw over infested spot or use gasoline blast torch. Keep close watch and destroy every portion of the vine as soon as it appears. Where appearing in grapevines or trees a measure of control may be had by spraying with 2 (a) in winter time and when trees are in leaf 2 (b).

ONIONS, LEEKS, GARLICS, ETC.

Insect Pests

Onion Thrips (Thrips tabaci Lind.). Attack the leaves and flowers causing considerable damage in some localities. Spray with 13 as an insecticide and with 1 or 2 (b) as a repellent.

Cutworms. See Beans, Peas, etc.

Fungoid Diseases

Downy Mildew (Peronospora schleideniana DB). Produces a white mould on the leaves causing them to wilt and die. Spray with 1 or 2 (b).

Onion Smut (Urocystis cepulae Frs.). First appears in the form of dark spots upon the leaves and later as longitudinal rifts upon the bulbs. The following drilled into the soil at the rate of 150 pounds per acre has given good results: lime 50 pounds mixed with sulphur 100 pounds. Also treat seed with 7 or 8 as they are being drilled into the soil.

CABBAGE, CAULIFLOWER, KALE, TURNIP, RADISH, MUSTARD

Insect Pests

Harlequin Cabbage Bug (Murgantia histrionica Hahn). Attacks all cruciferous plants, cultivated and uncultivated, as well as many other hosts. It is no little difficulty to keep these insects from taking a crop, but by observing the following they may be held in check: keep weeds from the field at all times; plant late trap crops of kale or cabbage and burn them when they become infested, or kill the bugs with pure kerosene. Hand pick adult insects as soon as they first begin to appear. Spray with 13.

Cabbage Aphis (Aphis brassicae). Attacks a wide range of cruciferous plants, cultivated and uncultivated. In time, it is subdued by parasitic and predaceous enemies, but often not until it has done great damage. It can be controlled by spraying with 13 or with 40 per cent nicotine sulphate, 1 pound to 100 gallons.

Cabbage Worms (Larvae of Pieris brassicae, the Large White Butterfly, and of Pieris rapae, the Small White Butterfly). These green worms do great damage by destroying, for market, great quantities of cabbage and cauliflower. The state insectary is at present propagating a very efficient parasite which destroys the chrysalid of this insect. As an insecticide apply 13.

Cutworms. (See under Beans, Peas, etc.)

Fungoid and Bacterial Diseases

Club Root (Plasmodiophora brassicae Wor.). A disease producing a peculiar enlargement of the roots giving the plants an unhealthy appearance and finally causing their death. The disease may be carried over in the soil, so the following has been recommended as a means of control: lime the soil at a rate of 100 bushels per acre, every few years. Rotate crops. Employ clean culture methods.

Black Rot (Pseudomonas campestris Smith). A bacterial disease first producing a burnt margin on the leaves and finally causing them to drop. The disease is readily carried from year to year in the seed. Before planting treat the seed with 7 or 8. Eliminate infected plants as soon as they appear in the beds. Rotate crops.

Tizit Spray

Used on 1000 Acres by One Man Proves Its Wonderful Value

Mr. Lowell N. Clark a professional Sprayer of Redlands who, for 18 years has devoted his time to the use of sprays and the work of eradicating scale and fungi from citrus groves, has these things to say of Tizit Spray:

"In the past four years I have sprayed about 1000 acres of citrus groves with Tizit Spray using no other means for controlling Black and Citricola scale.

"In my 18 years experience I have used almost every known preparation for the control of all kinds of scale found in Southern California and this experience has taught me that the only safe and efficient spray to use for Black and Citricola scale is Tizit.

"I know from long experience that Tizit is the only spray that will do the work thoroughly and consistently, with no injury to the fruit or damage to the trees.

"Growers whose orchards I have cleaned with Tizit are glad to testify that it has proven not only a money saver but a revenue producer."

The reason for this is obvious—clean trees always produce bigger and better crops.

If your orchard is infested with Black or Citricola scale it will pay you to find out what Tizit spray has done for others during the past five years.

Our citriculturist, Mr. Wyllie, will confer with you regarding your scale troubles.

Aggeler & Musser Seed Co.

620 S. Spring St., Los Angeles; California

Buy only Melilotus seed that has a quality tag on each sack. It protects you against the low germination seed so general on the market this season. This seed is above 99 per cent pure and above 90 per cent germination.

Make the reading of advertisements in the California Cultivator a habit. They will broaden your knowledge of the manufacturing improvements.

TOMATO, POTATO, EGG-PLANT, TOBACCO, ETC.

Insect Pests

Tomato Worms. (Are the larvae of two Sphynx Moths, Plegethonitus quinquemaculata How. and Plegethontius sexta Joh.) These large green caterpillars feed upon the foliage and are easily recognized. Due to their large size, it is very effective to hand pick the infested area. If very numerous spray with 18½ or 19.

Flee Beetle (Epitrix parvula Fab.). A very small beetle which works on the leaflets. As a repellent spray with 2 (b); for an insecticide 18½ or 19.

Twelve Spotted Cucumber Beetle. (Diabrotica soror Lec.). A small green beetle with 12 black spots on the elytra. The larvae work on a great variety of plants. Spray with 18½ or 19.

Tobacco Worms

Cutworms. (See Beans, Peas, etc.).

Fungoid and Bacterial Diseases

Winter Blight or Downy Mildew (Phytophthora infestans DB.) Attacks nearly all of the plants of this family, killing the leaves and injuring the tubers. Plant clean seed. Disinfect doubtful seed with 7 or 8. Spray plants with 1 or 2 (a) as soon as symptoms first appear.

Root and Stem Rot (Corticium vagum var. solani Burt.). Causes a "damping-off" of seedlings. Also attacks the tubers of potatoes, the subterranean parts of the tomatoes, and the fruits touching the soil. Apply lime to aerate the soil. Rotate crops.

Dry Rot of Potatoes (Fusarium oxysporium Schl.). Wilt of Tomatoes (Fusarium lycopersici Sacch.) and Wilt of Egg Plant (Fusarium sp.). All produce a wilt upon the host plants, affect the roots, and may even cause a "damping-off" of seedlings. Treat seed with 7 or 8 before planting. Keep weeds out of fields in winter. Rotate crops, so as to have clean soil each year.

Early Blight (Macrosporium solani E. & M.). A typical leaf-blight causing brown spots to appear on the foliage. Affects potatoes, tomatoes and daturas: Spray with 1 or 2 (a) when the plants are six inches high and repeat with three applications two weeks apart. Treat seed with 7 or 8 before planting. Rotate crops.

Potato Scab (Oospora scabies Thax.). Produces large rough blotches on the tubers. This disease cannot be dealt with while the plants are growing. Great care must be exercised in the matter of seed selection. Treat all seed of doubtful origin with 7 or 8. Rotate crops so as to keep the soil fresh.

SQUASH, PUMPKINS, CUCUMBERS, MELONS, ETC.

Insect Pests

Melon Aphis (Aphis gossypii Glov.). Attacks all parts of the vines and is usually accompanied by a black smut, which grows upon the honey-dew secreted by the louse. Spray with 13 or 15 or 20.

Cucumber Beetles, Striped (Diabrotica Vittata Fab.).

Twelve-spotted (Diabrotica soror Lec.). The larvae and adults of these beetles destroy flowers and foliage of the plants and gnaw the rinds of the fruit. Methods of control are as follows:

Repellents — Dust with 6 or with Naphthalene. Soak lumps of gypsum in a mixture of kerosene and turpentine and place them under infested vines. Insecticides — Dust with lime and then spray with 18½ or 19.

Squash Bug (Anasa tristes DG.). Hand pick early in the season; also pick off eggs and destroy. Eggs are deposited in clusters on the leaves when the vines are very young. Trap bugs by laying boards loosely on the ground under which they crawl for protection. If very troublesome a repellent of gypsum saturated with kerosene scattered about the grounds is effective. As soon as crop is harvested, gather and burn vines. Do not allow weeds to grow on the ground during winter months.

Fungoid and Bacterial Diseases

Downy Mildew (Pseudoperonospora cubensis Rost.). Disease first appears in the center of the vine and spreads outwardly. Spray with 1 or 2 (b) to which is added one gallon of sulphurous acid to every 100 gallons of spraying material. Repeat every ten days.

Leaf Blight (Alternaria brassicae nigrescens Pegl.). Produces spots on the leaves which spread very rapidly. This disease hastens ripening, injures production, and destroys the quality of the fruit. It particularly affects cantaloupes. Destroy affected plants as soon as they first appear. Spray often with 1 or 2 (b). Rotate crops.

Anthracnose (Colletotrichum lagenarium E. & H.). Forms circular dead spots on the leaves and long shrunken areas on the stems. The fruits of the watermelon are often badly spotted by this disease. Spray with 1 or 2 (b) as soon as fungus appears.

Common Wilt (Bacillus tracheiphilus Erw. Sm.). Produces a sudden wilt of the vines by stopping up the water-carrying vessels of the stems. Destroy infected plants as soon as infection appears.

Fusarium Wilt (Necosmopora vasinfecta var. nivea). Can be handled only by crop rotation.

Powdery Mildew of the Cucumber (Erysiphe polygoni D C.). Attacks other members of this group also. Forms a white powdery coating on the leaves and stems and soon kills the plants. Spray as soon as it first appears with 1 or 2 (b).

CELERY, CARROTS, PARSNIPS

Insect Pests

Celery Leaf-tyer (Phlyctaenia ferrugalis Hbn.). Destroys foliage, and its presence may be told by the many leaves which are curled and fastened together by this insect. It is particularly bad in greenhouses. Spray with 18½ or 19 not later than three weeks before marketing crops, because of the danger of poisoning. Hand pick.

Viridescent Leaf-hopper (Empoasca viridescens Walsh). Use hopperdozer in large fields or spray as soon as insects first appear with 13.

Cutworms. (See Beans, Peas, etc.)

Fungoid Diseases

Celery Blight, Early Blight (Cercospora apii Fr.). Produces spots upon the leaves causing them to turn yellow, to wilt, and finally kills them. This disease also affects parsnips, and usually oppears early in the season. Spray early and repeatedly with 1 or 2 (a).

Late Blight (Septoria petroselini var. apii B. & C.). Produces rusty brown spots upon the leaflets which may rapidly spread to cover the entire foliage. Spray with 1 or 2 (a) throughout the season.

ASPARAGUS

Insect Pests

Asparagus Beetle (Crioceris asparagi L.). Dust air slaked lime upon the plants when they are wet with dew. Apply dry lead arsenate or 18½ or 19. As a repellent spray with 28.

Fungoid Diseases

Asparagus Rust (Puccinia asparagi DC.). Attacks the bushy tops, producing black and red rust, the latter being the destructive stage. Keep the plants cut back until July 1. Apply dry sulphur three weeks after cutting tops and before rust appears. Make the applications in the morning when the plants are wet with dew, or first spray with 1 or 2 (b).

CORN, SORGHUM

Insect Pests

Corn Worm (Chloridea obsoleta). Is hard to deal with because it works on the ear in the husk. It is best handled by the rotation of crops, late plowing followed by harrowing to destroy the pupae in the soil, and by planting crop as early as possible to assure rapid growth. Dust with dry lead arsenate. (See 18½).

Corn Root Aphis (Aphis maidi-radicis Forbes). Attacks the roots causing a dwarfing of plants in patches over the fields. Crop rotation is the most important method of control. Stir old corn ground thoroughly before planting it again to corn.

Wireworms (See under Beans).

Fungoid Diseases

Smut (Ustilago zeae Ung.). Causes enormous enlargements of the kernels, producing large sacs of smut. Cut off and burn the first infestations. Treat seed with 7 or 8 before planting. Rotate crops.

Wilt of Sweet Corn (Pseudomonus stewarti Erw. Smith). Plants die by wilting due to the shutting off of the water supply. Select resistant stock. Treat seed with 7 or 8 before planting. Rotate crops.

GRAIN

Rust. No remedy. Some varieties are more resistant than others.

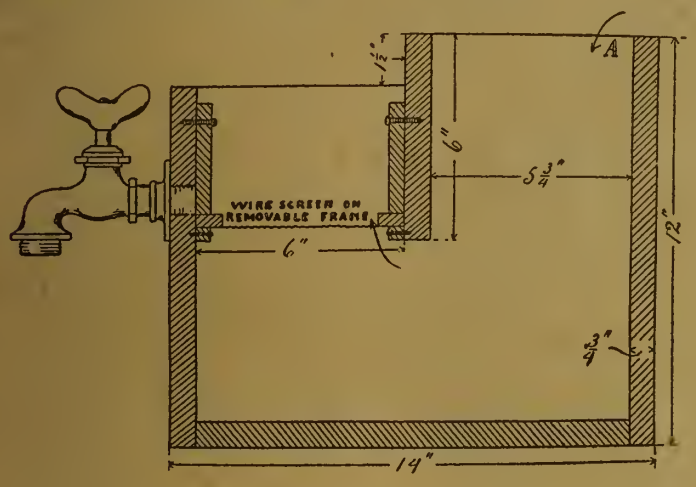
Smut. Seed grain should be carefully cleaned of smut balls, weed seeds and small cracked and inferior grains before treating. The smut balls in wheat and smut masses in barley may be cleaned out in fanning mills or floated out in water and skimmed. Place the cleaned seed in half-filled sacks tied at the end. Immerse these sacks for three or four minutes in a bluestone solution, 4 (a). Drain the sacks until dripping no longer occurs, then dip them for three minutes in 4 (b). The lime prevents injury to the germ from the bluestone.

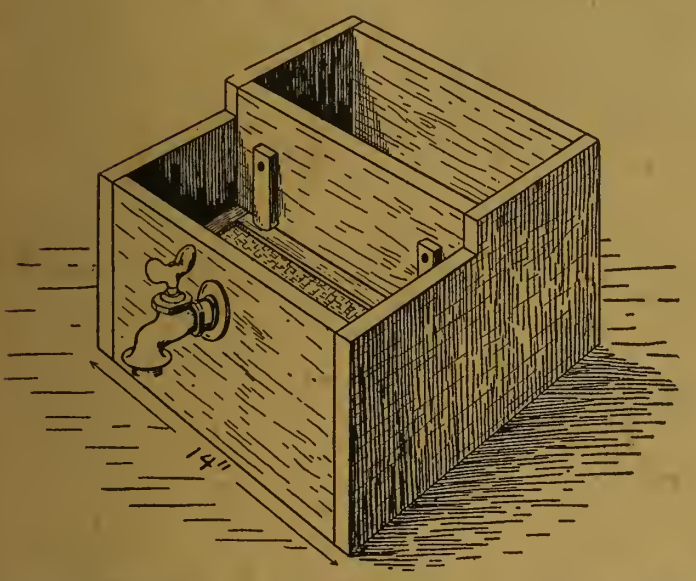
IN THE INTEREST OF COOPERATION

A program is being arranged for a meeting to be held at Santa Ana opera house on Wednesday evening, August 13, to discuss matters of cooperation. The meeting is being encouraged by bankers and business men of Orange County with the idea of securing for producers better returns for their crops and of inducing more general cooperative spirit. Mr. Cruickshank, an Orange County banker, C. C. Teague of Ventura and others will address the meeting. Those interested in the marketing of apricots, prunes, beans or other crops are joining in planning for the meeting.

LIQUID GAS

The longest step forward in securing efficiency and economy in fumigation of orchard trees is made possible by liquid gas. This gas in liquid form is made a commercial possibility through the investigations and experiments by Dingle Brothers of the Owl Fumigating Company. These men have persisted in the effort to better fumigation methods, being the first to bring out the machine for generating the gas and killing the scale with greater efficiency and economy than with the old method of manufacturing the gas in earthen vessels under the tent. But even the machine method of gas generation had its defects, one being in the high grade or quality of chemicals required. Hence the effort to manufacture this gas from cheaper materials in the factory where its purification is possible, and where it may be reduced to a condition in which it is portable and in which it may be used with safety. In this the Dingles have succeeded and are today completing a large plant at Azusa and are now prepared to deliver a 96 to 98 per cent pure article to the orchards in any quantity desired.





Stewart's strainer. The sediment collects below the screen instead of on it and does not fill up the screen

Strainer For Bordeaux or Solutions Where There Is Sediment

The solution is poured in at A and the clear liquid rises through the strainer instead of clogging or filling screen with settlings.

If quicklime cannot be secured, air-slacked lime, 1 pound to 8 gallons of water, may be used. After thus treating, the grain should be spread out to dry, after which it may be planted or stored.

Oats are especially sensitive to bluestone and in this case it is better to use a solution of formaldehyde, 1 pound to 40 gallons of water, for ten minutes, after which no lime dip is needed. Barley is more sensitive than wheat and should always be lime-dipped after treatment with bluestone.

BEETS

Curly Top (Blight). Plant as early in season as soil can be properly prepared and good germination and growth obtained. This varies in different districts from December 1 to March 1, according to temperature and rainfall. Finish thinning before hot weather. Irrigate early, and often enough to prevent wilting during spring and summer. The disease need not be feared unless the insect Eutettix tenella is abundant.

Seedling Root Rot. Replant if stand is too thin.

Wireworms. Plow in fall to destroy pupae. Plant early and practice clean culture. Trap adults by means of piles of straw and burn in late fall or winter.

A cannery for San Jacinto next season is being discussed.

Members of the Arlington Poultry Association picnicked recently at Fairmount Park. An interesting meeting was held to discuss cooperative plans of marketing.

The San Dimas marmalade factory is again open for operations after a short time when it was closed for repairs to machinery and equipment.

Dry or Dust Process

By John S. Davis

IN the study of the protection of plants from insect depredation, attention is drawn to the curious fact that practically all recent developments in insect control have been in the perfection of formulas and method of application for dry or "dust" insecticides.

Notable, among the most recent, is the experimental and practical work of Prof. Ralph E. Smith, in cooperation with the Walnut Growers' Association. This cooperative effort has resulted in the perfection of a dust formula far superior to anything heretofore known for the destruction of the aphis. Further experiment is being made in the perfection of a formula for the control of codling moth. Present indications point to complete success in this work.

Dry sulphur has been used with varying success for many years in the control of red spider. Many combinations, such as sulphur and hydrated lime have been tried, with results offering little encouragement. Experiments of the past year or two however demonstrate that the use of diluents is a clear waste of time and material. Hydrated lime was used principally for the purpose of causing more sulphur to adhere. An excessive quantity of sulphur does not kill. But sulphur gives almost perfect results, if it be applied properly and with sufficient frequency. In fact, the frequency of treatment is the real key to success; that, and the fineness of the sulphur. Sulphur should be applied very sparingly, or thinly; but thoroughly covering every portion with this very fine thin deposit of pure sulphur, so thin and fine as to be almost invisible. A dosage of from 8 to 10 pounds per acre of bearing orange tree is ample if properly distributed; and, by repeating these dustings four or five times, at weekly intervals, practically complete cleanliness is secured.

This is true economy. A clean grove is a productive grove, and pest protection means increased yield.

"Economy and protection" may be called the watchword of the dry, or dust, system. With one man treating from 15 to 20 acres per day, and using only 10 pounds of sulphur, comparatively the cost of protection is so insignificant as to be negligible, and the results are said to be practical eradication.

Under this head it would seem well to call the attention of the growers to the crying need for the control of the fall attack of spider. As this late attack occurs at a time when neither crop nor tree are injured appreciably, most growers are inclined to disregard it on the ground that "no harm is done." Herein lies a great mistake. This fall visitation is largely responsible for the supply of spider the following spring. Consequently, every spider killed in the fall means a proportionate decrease in the spring attack; and, as before stated, the cost of protection is so slight as to be almost negligible.

A Small Duster In Action

A most economical way of sulphuring or applying other dust remedies to orchard trees and vineyards.

PESTS OF THE GARDEN

By Ernest Braunton

The most serious flower trouble in California is mildew on roses. The best means of combating it is to keep it away. But few varieties of roses are afflicted with mildew if in good health and soil conditions are correct. But there are a few sorts that need nothing more than a few days of unfavorable weather to become thoroughly covered with mildew.

Mildew on Roses

The fight in the garden should be to avoid extremes and sudden changes, just what the orange grower should guard against to prevent June drop. If roses are watered at night during the mildew season they are cold and wet until sunshine next day. About noon the vines or bushes are hot and dry, just the reverse of night conditions; yet in the evening you again water them. This is all wrong for winter treatment. Equalize conditions as much as possible by leaving them dry and warm during the night. Water in early morning and by night, if the day be bright soil and air will be warm as possible. Roses are often affected with mildew because a daily spray of water is given to wet the surface soil while the plant is actually dry at the roots a few inches below the surface. Irrigate heavily and sufficiently. Good drainage is also essential to successful rose growing. (See Formula 6).

Other Rose Troubles

In some countries roses have many

troubles, but in California they are few. Aphis or plant lice are next to mildew in importance, followed by the rose or orange rust and Fuller's rose beetle. Aphis are easily destroyed by any contact spray, even driving them off the plants with a strong force of water will keep them well in control. Bordeaux mixture or any fungicide will destroy the rust. The writer has never known the rose beetle to be serious, but arsenate of lead, three pounds to 50 gallons of water, is recommended as a spray, and this is also the best for the diabrotica or "green lady bug" which is the worst pest in the writer's garden on flowers. The white rose or berry scale is sometimes troublesome and kerosene emulsion is a good remedy. These bugs are either striped or spotted and usually known as squash bugs or cucumber beetles.

Red Spider

At times red spider will attack nearly all sorts of plants and unless checked does most serious damage. Near the coast, where the air is damp there seldom is any sign of red spider, but in dry atmospheres its ravages are considerable. Gardeners seldom employ other means of riddance than frequent sprayings with the garden hose, but should other means be found necessary the measures taken by citrus growers for suppression of red spider should be used.

CARBON BISULPHIDE IN GROUND SQUIRREL CONTROL

CARBON bisulphide applied to ground squirrel burrows when the ground is fully saturated with moisture, is the most satisfactory material to use. Wasteballs soaked in this liquid are sufficiently loose to allow evaporation of the carbon bisulphide. Diffusion is thereby accomplished, after which the gas can be exploded in order to force the products of such combustion to the further recesses of the burrow. Every burrow must be treated with one soaked wasteball and, following the explosion, be covered with one or more shovelfuls of earth. This earth covering must be tightly tamped. Exploding is accomplished with a match or torch after allowing from four to ten minutes for vaporization of the carbon bisulphide, depending upon the temperature and weather conditions. On a cold, foggy day, eight to ten minutes should elapse before exploding.

Carbon bisulphide is most easily handled in an open pail. Fill the pail about three-fourths full of the liquid carbon bisulphide and place in same enough jute wasteballs to be covered by the liquid. To prevent evaporation, a thin film (one-quarter inch) of water can be poured over the carbon. Each wasteball holds enough carbon bisulphide which when vaporized and mixed with air, forms a gas of sufficient concentration and strength to kill a squirrel.

Immediately following this treatment every burrow should be sealed with damp earth and very tightly tamped with earth to prevent the gas from escaping. Carbon bisulphide should be used only when the ground is sufficiently damp to prevent the gas from escaping through cracks or porous earth. When properly applied it will produce a killing not approached by any poisoning method. Poison grain is not satisfactory during the winter and spring season when the squirrels can obtain green feed in abundance.

Exceptional precautions must be observed to keep fire away from containers holding carbon bisulphide in view of the extremely explosive nature of the material.

SEED DISINFECTION BY FORMALDEHYDE

"Seed Disinfection by Formaldehyde Vapor" is the title of a recent publication of the United States department of agriculture. It states the following conclusions:

The use of liquids for disinfection is unsatisfactory for many kinds of seeds.

A number of species of fungi and bacteria are killed when treated for two hours with 20 ounces of formaldehyde vaporized under the conditions described.

This same treatment is not injurious to any of the seeds tested.

The experiments completed indicate that the formaldehyde gas treatment is a very efficient means of seed disinfection.

The publication is a reprint from the Journal of Agricultural Research, is written by C. C. Thomas and may be obtained by application to Department of Publications, Washington, D. C.

Don't be Frightened at a Bug that Looks Like This

Of all the specimens sent to the Cultivator for identification none come oftener, unless it be the aphis which smears up many a letter, than katydid eggs. These have a most formidable appearance and many a fruit grower has had a scare thrown into him because they look large enough to eat up a whole tree. While they look more like real scales than the scales themselves do, they are comparatively harmless. However, when in doubt send your specimens to the Cultivator. They will be submitted to experts and will be identified where that is possible.

FUNGOUS PARASITES OF INSECTS

Attempts have been made from time to time to control insect pests through the dissemination of fungous spores, and the results have been variable and generally unreliable.

A recent Parisian publication says that it has been demonstrated that it is not only necessary successfully to disseminate the spores of a given fungus, but also that the prevailing conditions must be favorable for its development. Also it is shown that there are certain stages in insect life history at which the host is more susceptible to infection and that at other times the host is able successfully to resist infection. Various fungi have different methods of infection; some penetrate the integument of the insect; some the digestive tract and some the respiratory system. Epidemics of fungi are almost entirely dependent upon weather conditions, cool, damp weather promoting, and warm, dry weather retarding dissemination.

International Motor Trucks
For Country Road Hauling

OF ALL the motor trucks offered for farmers' use, the **International** should be, and we believe is, the most satisfactory.

This Company knows the country — roads, farms, and all. Farmers know our standards of quality and service. When we offer a motor truck for farmers' use, it is understood that the truck will do the work expected of it at a cost farmers can afford.

The **International Motor Truck** is built for carrying capacity loads on country roads. It gives satisfactory everyday service, the kind that farmers must have. When an emergency comes — a tough piece of road, a steep hill, a rush trip, a bad day — the **International** has the reserve power, speed, and endurance to carry it through.

Mr. L. C. Henry of Utica, Minn., purchased an International Motor Truck to haul his live stock and farm produce to market and to bring return loads from town. He says, "We use the truck for nearly every kind of hauling. It saves more time than any other machine in our farm service." Five of Mr. Henry's neighbors bought International Motor Trucks when they learned, from his experience, what a useful economical farm machine he had.

There are four sizes of **International Motor Trucks** — 1,500, 2,000, 3,000 and 4,000 pounds capacity, with bodies suitable for every kind of hauling. We have a dealer, a branch house, or a service station somewhere near you, where the line can be seen, or we will send full information promptly if you will write us.

Whitewashing Pruned Trees

IN THE California Cultivator of July 19 I notice what Dr. Whitten has to say about whitewash on young trees. Do you think any harm would result if whitewash was applied with a spray pump to all the branches and twigs on bearing apricot trees? If advisable to make this application in the winter time when trees are dormant what amount of lime could be used in a 200 gallon tank of water, and what other ingredient should be used to insure sticking? I would only consider this as a treatment after lime-sulphur solution had been applied, but not as a substitute for that valuable treatment. Perhaps a good coating of whitewash would make it exceedingly difficult for brown rot, twig blight and shot hole to make an appearance. Two applications of lime-sulphur in one winter might be too severe for the trees. An opinion on the above suggestions would be appreciated.—Subscriber, Vacaville.

As this query mentioned Dr. Whitten's address it was referred directly to him and he answers:

I have tried spraying peach and plum trees, in Missouri, so as to keep the entire tree covered with whitewash during the entire winter, for the past 20 years. It prevented sunscald of the trunks and used on the trunks for that purpose it was a practical success. The whitewash on the twigs reflected the heat on sunny days, holding the buds dormant for a longer time. It delayed bloom from three days to a week (where the twigs were kept thoroughly covered with the whitewash) and lessened injury from frost. The main advantage was not in this slight delay of blossoming, however, but because the buds were held dormant until late winter (six weeks later than on untreated trees), thus preventing weakening of the buds by alternately warming up and becoming tender on sunny days and then freezing at night. It was not adopted as a commercial success, generally, in the Mississippi valley for the reason that winter rains and alternate freezing and thawing necessitated frequent spraying with the whitewash to keep the twigs well coated with it.

Answering more directly the question of L. J. H. Dr. Whitten adds:

No harm will result from spraying the entire fruit tree with lime whitewash, during winter. If sulphur is included (with the slacking lime) the wash will prevent leaf curl of peaches, reduce mosses and lichens, reduce certain species of scale insect and result in cleaner bark of the trees.

The main advantage however is in keeping the buds and twigs dormant for a longer period, providing the twigs are kept thoroughly covered by the wash, to reflect the heat on sunny winter days. This is especially true in the sunny interior valleys. During bright, sunny winter days the coloring matter in the bark of fruit trees absorbs heat from the sun, raising the temperature of the buds and growing layer 15 to 25 degrees above the temperature of the surrounding air. As soon as the sun is down the tree cools rapidly down to the air temperature. Whitewash reflects the sun's rays, keeping the temperature of the tree a degree or two cooler than the air. The buds and tissues of untreated trees become slightly active and tender during sunny days and are slightly injured and weakened by subsequent cold nights. Well whitened trees remain slightly cooler than the air on sunny days, retain their dormant condition and are not tender enough to be susceptible to weakening by following cold nights. The actual winter rest period of the buds is prolonged from four to six weeks by keeping the twigs whitened. That is, the first slight starting into activity (which makes the buds sensitive and tender) is thus delayed. The actual blossoming period is delayed from three days to a week, if the twigs are kept thoroughly white so their coloring matter does not show through.

The writer tried this out in the Mississippi valley for a period of ten years, especially on peach and plum trees. There was less winter killing of the buds and less injury from spring frosts on the treated trees. On two seasons in the ten years good crops were secured on the whitened trees when untreated trees failed. The treatment was not adopted as a general commercial success for the reason that it required frequent application of the wash, which wears off quickly through alternate freezing and thawing, winter sleet and rain and whipping of the twigs in the wind. A thorough white coat must be maintained to be effective.

Whether this method will prove a commercial success, under California conditions, for protecting the buds and twigs can only be determined by trial. It will be of much interest if growers will try it, on a few trees at least. The commercial success of whitewashing the trunks and exposed limbs, especially of young trees, while their bark is thin, to prevent sunscald, where it occurs on the sunny side of the tree, has been proven beyond a doubt at the California experiment station.

A good whitewash, which will stick better than lime and water alone, may be made as follows:

Seven pounds quick lime.
Two pounds common sulphur.
One pound common salt.

Slack the lime by sprinkling it with water (warm water is preferable) and spread on the sulphur and salt as the lime begins to get hot. Add water and stir to keep the lime from "burning" dry. Keep it wet enough to prevent drying (or burning) but do not flood with enough water to "drown" the lime, but slake so as to secure a thin paste (as for mortar) by the time the lime is slaked. The stirring mixes the salt and sulphur with the mass. The heat of the slaking lime acts on the sulphur and salt so as to make the wash stick well to the trees. When the lime is slaked to a thin paste cover it to retain the heat and let it stand for 24 hours. Enough water should be stirred in so the paste will not dry out in cooling. When cooled for use add water enough (about 15 gallons) to make a whitewash as thick as will flow readily through the spray nozzle. Strain (to get out grit that would clog the nozzle) when filling the spray tank.

Prof. Woglum's Method of Poisoning Argentine Ants

The Argentine ant is one of the most serious orchard pests and poisoning is cheapest and most effective "cure." See formula No. 23 which is fed to ants in old spice cans as shown above.

CAROB RICH IN SUGAR

There are two trees of the carob growing in Orange County which made a remarkable showing with regard to sugar content. Fruits from these trees were sent to the University of California by Mr. McDannald of the Orange County Chamber of Commerce, and one known as the Anaheim Library tree showed a sugar content of 44 8 protein 4 8. Another known as the Langenberg showed a sugar content of 30.2, protein 5.7.

Crop Losses

due to exposure of crops to the elements, shortage of labor, inability to reach market at the right time, are conservatively estimated to be 25 per cent of total production.

Such losses would pay for enough Kissel Trucks to get all the fruit to market when it is ripe, all the beans and dried fruit and hay in out of the rain, and meet every other transportation requirement of the farm.

The ownership of a Kissel Truck gives a tremendous advantage to any crop producer.

The time, labor and expense saved in hauling alone soon pays for the truck and those who do commercial hauling earn an average of $25 per day, at a total cost around $10 per day.

The Kissel Truck has a sturdy Kissel built engine, perfected worm drive rear axles, heavy duty front axles, heat treated frame, the all weather cab and large loading space.

Thousands of Kissel Trucks are proving their dependability daily, in all of America's great industries, of which farming is not the least.

There is a size for every farmer who has a transportation and crop loss problem. Kissel Trucks are built in ¾, 1½, 2, 3½ and 5 ton models.

Owning a dependable truck has saved many a crop.

If you have a transportation problem let us figure with you on its solution.

Taking Water Out of Valley

Can owner of land in a valley develop water thereon and pipe it out to a neighboring valley for his own benefit against the protest of other owners of land and water rights in the valley first mentioned?—Subscriber, Nestor.

The other owners of water rights in the first mentioned valley certainly are entitled to have their rights protected, but as the facts stated in the question are not and in the nature of things could not be stated with sufficient fullness, a definite answer cannot be given. In this state there has been organized a board of water commissioners, among whose duties it is to ascertain the relative rights of various water claimants, to hear the testimony in respect to such and ascertain by their findings the rights of the several claimants to the use of such water. They are also entitled to supervise the distribution of water in accordance with the priority rights of different parties, and after such hearings to make their decree which may be filed in the office of the recorder in each county in which the body of water is situated. It will doubtless be to your advantage to take up your question in that way.

Rights of Survivors of Joint Tenancy

Deeds of community property have been made as joint tenants with right of survivorship, also certificates of stock made out in the same manner, and bank account. In case of the death of either husband or wife would all business and properties be left to surviving party without any administration?—Subscriber, Covina.

As to the real estate, it would be necessary in order to complete the chain of title for the survivor to file a petition to have the fact of the death decreed of record. As to the stocks held under the right of survivorship, the corporation might or might not require the fact of death to be definitely ascertained of record before issuing a new certificate. The bank account could doubtless be drawn out by the survivor. As to any business it would probably be subject to administration. There might be necessity for administration in any case in order to ascertain the value of property transferred in this manner for the purpose of fixing an inheritance tax both to the state and federal government.

Exclusion From Irrigation District

An irrigation district is about to be formed, in which I am located. I do not need this district as I have installed my own private pumping plant, and long since have so graded my land that it can be irrigated only from the center. The irrigation system would require me to scrap my pumping plant and re-grade my land, which would practically destroy my trees. Is there any provision to permit me being excluded from this district? I am located upon the extreme edge thereof.—Subscriber, San Francisco.

There are several different statutes concerning the organization of irrigation districts. To answer accurately it will be necessary to know under which of these statutes the district in question is being formed; in all of them, however, there are provisions for the exclusion of lands, the owners of which do not desire to be incorporated within the district. In several statutes a first step is for the organizers of the district to make a petition to the county supervisors. The supervisors thereupon publish notice of the filing of petition and the day upon which it shall be heard. Prior to that day protest against the inclusion of any described lands may be filed, and the board of supervisors is entitled to make such changes in the proposed boundaries as it may deem advisable. It is usually provided that no lands which will not in the judgment of the board be benefited by irrigation shall be included within the proposed district, which places the decision squarely upon the supervisors acting in judicial capacity; after incorporation of the district some of the statutes provide for means whereby the owner can procure his exclusion. Generally considered, the supervisors would be the court of final resort, as the courts are very loath to review a decision of such a board, fairly made.

Chattel Mortgage

Husband gives a chattel mortgage on stock without wife's signature. In case of non-payment, can the mortgage take the stock.—Subscriber, Torrance.

The husband has the management and control of the community personal property, with absolute power of disposition other than testamentary, as he has of his separate estate, provided that he cannot make a gift of such property or dispose of it without valuable consideration, mortgage, sell, convey or encumber the furniture, furnishings or fittings of the home or the clothing or wearing apparrel of the wife or minor children that is community without the written consent of the wife, therefore the wife's signature upon the chattel mortgage is unnecessary to a valid chattel mortgage.

Bankruptcy—Mortgages

A man having all which he owns mortgaged, goes through bankruptcy. Can the mortgagee collect anything or will the bankrupt be able to hold everything?—Subscriber, Torrance.

The bankrupt act expressly upholds valid mortgages. If the mortgage is given and accepted in good faith without fraudulent intent for a present consideration, and duly recorded, the mortgagee will have no trouble whatsoever; the trustee in bankruptcy takes the property subject to the rights of the mortgagee and is entitled to sell the property subject to the mortgage, and in order to effect such sale may temporarily restrain the mortgagee from foreclosing, but the mortgagee is entitled to foreclose his mortgage in the state courts with interest, have sale of property and prove his claim in bankruptcy for any deficiency. The last two statements may seem to be a little inconsistent, but the stay of proceedings is a matter for the discretion of the United States courts and will be made only upon a showing that the bankrupt's estate would be benefited, and is usually dependent upon the existence of a considerable equity in the mortgaged property.

The New 16 Valve

Twin City Tractor

Pays Big Dividends

For the first time in the history of the tractor industry, the 4 cylinder, 16 valve engine (valve in head type) is now applied to a tractor. The TWIN CITY 12-20 with its 16 valve motor actually develops 25 per cent more than its rated horsepower.

This new 12-20 is a light weight tractor that will out-pull, out-last and out-dividend other tractors of equal rating.

Not built down to a price, but built up to a fixed ideal—to do the work assigned to it better than it has ever been done before.

The highest grade tractor will unfailingly prove the least expensive and pay the biggest dividends.

Nation-Wide Drive to Improve All Live Stock

During the past few months the United States department of agriculture has been working out the details of a broad plan for improving the live stock of the nation. The following article is the announcement of the campaign which is scheduled to start October 1:

LOOKING forward to the future food needs of this country's increasing population, the United States department of agriculture, in cooperating with the state agricultural colleges and other agencies interested in live stock improvement, announces a national better live stock crusade, to get actively in motion October 1 under the slogan of "Better Sires—Better Stock."

The plan is to hasten the replacement of the multitude of scrub domestic animals in the United States with pure bred or high grade stock and also to improve the quality of purebreds themselves. It has been evolved through long and careful observation of the live stock industry in this country and after extensive consultation with specialists and breeders.

Nation's Milk Average Low

For many years this country has contained thousands of the finest specimens of live stock in the world, but in spite of that fact the quality and productive capacity of the average farm herd and flock is still low. For instance, the average dairy cow in the United States yields about 4000 pounds of milk a year, a figure scarcely two-thirds the average production in some European countries, such as Denmark. The United States has thousands of cows which have milk yields of more than 12,000 pounds, double the Danish average, but on the other hand it has hundreds of thousands which are kept for milk and yet yield only a small fraction as much product as the best cows, though receiving nearly as much feed and care.

The difference in milk yield is due in large measure to a difference in breeding, but a herd of low production can be improved rapidly by the use of a pure bred sire from a family of high producers.

More Sirloin on Well Bred Cattle

Among all classes of live stock a similar condition exists. Proper breeding of beef animals results in better and more uniform stock, having a greater percentage of desirable cuts of meat and a smaller quantity of bone, offal, and inedible parts. Likewise in swine, sheep, goats, and poultry production, the kind of parent stock largely determines the quality and market value of the products. The crusade of improvement now to be undertaken is the outgrowth of investigations in genetics, of live stock observations in many countries, and a close study of public opinion. In most live stock regions of the world a gradual evolution toward better live stock has been taking place for centuries. The rapidity of these changes has an important bearing on world commerce and on the prosperity of the nations in which improvement has been greatest.

Individual and community efforts in many cases have resulted in marked live stock progress in small areas. The Islands of Jersey and Guernsey are familiar examples of this kind of accomplishment, but no large country so far has endeavored in an organized way to improve all its live stock simultaneously.

Live Stock Men Equal to Task

Officials of the bureau of animal industry and others who have considered the problem from every angle are convinced that it is possible to hasten the natural course of live stock evolution with benefit to the nation. They are confident also that the live stock men of the country are eager to undertake the task.

The means of accomplishing most of the improvement—which affects about 200,000,000 head of live stock, besides poultry — will be through wider distribution and increased use of pure bred sires and dams.

Once the use of pure bred sires becomes general throughout the country, the process of grading up will be rapid. Many experiments and also practical experience, when good sires are used, show that within three generations most of the individuals in a scrub herd headed by a pure bred male resemble pure bred animals in appearance. In a few more generations, under skillful breeding, the former scrub stock is graded up to such an extent that for production of meat and other animal products, they are practically as useful as pure breds. The chief difference between a "high grade" animal and a pure bred is in the value for breeding. Only the latter can be used in producing pure bred breeding stock. Moreover only pure breds are eligible to registry.

Official Emblem to Be Furnished

The department of agriculture through its cooperative state agencies is preparing to supply live stock raisers with printed information that tells in popular language the best animal breeding methods and the advantages to be derived from their use. In addition the department of agriculture is to furnish an official emblem, suitable for display, to every farmer agreeing to use only pure bred sires and in other ways to cooperate in the better live stock effort. To obtain the emblem a farmer or breeder will be asked to fill out a simple blank showing the number and kind of live stock he possesses and also to declare that all his male breeding animals are pure breds. From the number and nature of the blanks received the department will be able to measure the progress of the crusade, and at the same time obtain valuable statistical information which will be made public at suitable intervals.

The betterment of the nation's live stock is by no means a new idea. The topic has been discussed at length from public platforms and in the agricultural press for many years. Agricultural colleges, breeders' associations, various live stock organizations, banking and business interests, live stock judges and experts—these and other forces are responsible chiefly for the progress already made and the sentiment for further development.

Organization of Campaign

A general coordination of the work, however, now seems desirable, with a minimum of red tape and a maximum of red blood. So far as the activities of the department of agriculture in the crusade are concerned, the bureau of animal industry, in cooperation with the state colleges of agriculture, will be responsible for live stock policies, especially the breeding work and scientific problems. The states relations service of the department will work in cooperation with the colleges of agriculture for carrying the plan of action through the extension divisions to every live stock owner who can be reached. County agents and other field workers of the department and the colleges will be local sources of information and assistance.

While it is believed that stockmen of the country naturally look to agricultural officials to inaugurate a crusade of this kind the problem primarily is one of adequate production and effective distribution. Responsibility for success depends accordingly on breeders and all live stock owners.

Response to Will of People

For several months the department

A moving stream of live stock which the packers *must* buy

The packer feels an obligation to take the live stock that comes to market and find an outlet for it.

Why this obligation?

It is because the stockman has fed his live stock to the point where it must be sold or they will get thin again and labor and expensive feed be wasted.

If the stockman could not sell his shipment and had to take it home, he would lose on everything—freight, feed and time.

Several such losses would discourage him and he would raise less live stock. Hundreds of other stockmen also would plow up their pastures. The supply of meat animals would diminish.

The packers would not be able to get enough live stock and often their big, expensive plants would be idle. The public would go meat hungry.

In short, for the best interests of everybody, the packers believe it sound to do their full share to maintain an ever open, cash market, and this is accomplished at a profit of a fraction of a cent per pound. This system has encouraged live stock feeding.

Only a policy like this will provide a better meat supply for a growing nation.

has been making an analysis of live stock sentiment as expressed in the farm press and in correspondence received in its various offices. Of all the topics discussed the need for a better quality of domestic animals has been preeminent.

To make the crusade against scrub live stock most effective the department welcomes constructive ideas and suggestions from all sources. The following classes of live stock are to be included in the campaign for improvement: Cattle, horses, asses, swine, sheep, goats, and poultry.

Many Problems—None Insurmountable

In spite of the conspicuous merits of the task about to be undertaken, there are also a number of obstacles. It is recognized that sentiment in favor of pure bred sires, while strong, is by no means unanimous. To win the support of those who, through lack of interest or opposition, fail to take their part in the crusade against scrub live stock is one of the problems to be met.

The cost of desirable pure bred sires is another important factor which has long been an obstacle to live stock improvement. Cooperative ownership divides the expense considerably, and the increased value of the young stock raised also helps to overcome that objection. In addition the campaign is expected to stimulate a greater production of pure bred breeding stock of good quality.

The question of controlling the spread of live stock diseases when animals are transferred from one herd to another or are used in community circuits, is still another problem. This matter, however, can be handled by vigilance in field inspection and by the adoption by breeders of well recognized preventive measures.

There are other problems also more or less knotty, but not presenting difficulties of an insurmountable character. In connection with the drive on scrub sires there will also be waged a campaign against the "scrub pure bred," as it is called, in the endeavor to eliminate, as breeding animals, pure breds of inferior quality. It will be observed that the plan in no way interferes with any work in live stock improvement now being conducted, but instead it is expected to make all the work more definite and effective by providing official recognition for progressive breeders, including members of boys' and girls' clubs. Friendly competition is expected to spring up among communities and entire states, each of which will seek to excel in the rate of live stock progress.

AN IMPORTANT RECORD IN MORRIS HERD

A yearly record of more than ordinary importance was recently completed by the grand old cow Aaggie Acme of Riverside, owned by A. W. Morris & Sons Corporation, Woodland. This well known cow had a previous record, made at six years of age, of 15,032.6 pounds milk and 808.82 pounds butter in one year. She has always been a large and persistent producer, and when she freshened last year at past 11 years of age she was in such promising form that her owners decided to continue her on yearly test, with the result that her year's work was recently completed with records of 20,354.8 pounds milk and 1053.14 pounds butter. She is not only a wonderful producer but a great breeding cow as well, numbering among her offspring Aaggie Acme of Riverside 2nd, holder of the world's strictly official record for butter production in one year; Prince Riverside Walker, senior herd sire in W. J. Higdon's herd at Tulare, and King Aaggie Mead, who is in service in the Morris herd and to which the $11,200 daughter of Tilly Alcartra was in calf when sold at Philadelphia in June. This latest Morris record materially strengthens the breeding of a number of high class bulls now in service in California, and it also further increases the average for the seven nearest dams of the $11,000 bull Sir Aaggie Mead De Kol, now heading the herds of C. L. Amos and John Arffman in New York.

Prince Walker Cornucopia
The Highest Record Son of Prince Gelsche Walker

His dam: ALBA SADIE CORNUCOPIA CREETA has just completed official records of 36.26 pounds butter from 516 7 pounds milk in seven days. Her previous records were as follows:
At seven years—
Milk 338 days.....18,849.40
Butter 866.28

His Calves Are Beauties

King Korndyke Pontiac 20th

Every one who is fortunate enough to own a son or daughter of KING KORNDYKE PONTIAC 20TH our $6500 herd sire, is enthusiastic about the splendid type and beautiful marking of his calves. While they are only babies his daughters show great promise of developing into exceptional dairy cows.

His young sons are moving fast, and it will pay you well to see us now about one for your herd, for we are not going to be able to fully supply the demand for some time to come.

Our Entire Herd is Tuberculin Tested

Breeder Big Type Poland-Chinas

A carefully selected lot of bred sows and gilts will be offered at public sale October 7th.

A Stated Fact

GOLDEN STATE KING is the Greatest Breeding Poland-China Boar on the Pacific Coast.

Sired by Golden Gate King one of the greatest boars the breed has produced. 30 of his pigs will be shown at State Fair. They will easily prove this statement. Strictly Big Type.
His get will sell in the Poland-China sale at Lodi, September 19.

W. A. Young **Lodi, Calif.**

FUTURE HERD SIRES

A better lot of young boars, future herd leaders, cannot be found. Sired by Golden State King and Big Bone Bob. Breeders who have seen my young Poland-China boars are unanimous in pronouncing them excellent prospects. They are high backed, big boned and have plenty of stretch. Write me for description.

J. F. Lehman **Lodi, Calif.**

Big Type Poland-Chinas

that are strictly big type. Big type sires—big type dams produce for me real big type animals. Usually sold down close but frequently have an exceptionally good one for sale. It will pay to keep in touch with me.

Eugene Milner **Lodi, Calif**

Blue Valley Model

Our junior herd boar comes from a long line of strictly big type breeding. Individually he is all we could ask. We sell big type Poland-Chinas that give satisfaction. Write

Poland China Ranch **H. B. Peake, Mgr.**
San Bernardino, Calif.

Extra parts are always available without delay for standard advertised machinery. This class always found in the California Cultivator.

Safeguarding Live Stock

ANIMALS suffer great discomfort and pain because of attacks of flies and other insect pests. Entire freedom from these pests can not be afforded but a measure of relief can be had with a little thought and preparation. The common stable or house fly is perhaps the cause of the greatest discomfort. There are by repellents offered by manufacturing chemists which are effective. A good home-made repellent is:

Fly Repellent

Common laundry soap	1 pound
Water	4 gallons
Crude petroleum	1 gallon
Powdered napthalin	4 ounces

Cut the soap into thin shavings and dissolve in water by the aid of heat; dissolve the napthalin in the crude oil, mix the two solutions, put them into an old dasher churn, and mix thoroughly for 15 minutes. The mixture should be applied once or twice a week with a brush. It must be stirred well before being used.

Warbles or Grubs in Back

Grubs weaken cattle, cause loss of flesh and reduce quantity of milk. This pest causes a loss of $50,000,000 annually to this country. The attacks of the fly which causes the warble may be lessened by the above fly repellent. The warble already established in the back should be removed by slightly increasing the opening with sharp knife and pressing out the grub. Be sure it is destroyed in order to prevent the maturing of another fly. Small oil can with kerosene may be used to force a drop of oil through the opening which kills the grub. This is not as satisfactory as the other treatment. If a neighborhood will combine entire eradication is possible.

Mites and Scabs

Mites cause untold loss and yet are easy of control with the ordinary animal dips. Commercial mixtures are good or one may prepare the old time sulphur dip very similar to the formula given in 10. Use for an animal dip at a strength which contains around one-fourth of one pound of sulphur to the gallon. Be sure to use only clear liquid allowing no sediment in the dip. Have temperature of bath around 100 to 105 degrees.

Arsenical Dips

The formula commonly used in making an arsenical dip is as follows:

Sodium carbonate (sal soda)	24 pounds
Arsenic trioxid (white arsenic)	8 pounds
Pine tar	1 gallon
Water sufficient to make	500 gallons.

Put 25 gallons of water into a kettle or tank of 40 to 50 gallons capacity, heat to boiling, and add the sal soda. When this has dissolved add the white arsenic, then boil and stir for 15 minutes or longer, until the white arsenic has entirely disappeared. Cool to 140 degrees Fahrenheit (by the addition of cold water if desired), then pour in the pine tar in a thin stream while constantly and vigorously stirring the solution. Immediately empty the liquid into the dipping vat, which has already been three-fourths filled with water, and stir thoroughly.

A by-product of the action of sodium carbonate on white arsenic is the gas carbon dioxid. The escape of this gas is attended with considerable foaming of the solution, so the kettle must be generously large, and the operation of boiling must have constant watching to prevent the liquid from frothing over the edge of the kettle.

The kettle or tank, utensils, and materials must be perfectly free from all greasy or oily substances, as a small quantity of such matter is sufficient to form a coating over the arsenic, and thus to prevent or delay its solution.

If very hard water is used there may be some residue of gray or whitish powder left undissolved. In such case it is not arsenic and the solution may be perfect.

Nicotine Dip

Successful animal dips of nicotine usually contain not less than five one-hundredths of one per cent pure nicotine, and two per cent flowers of sulphur:

Forty per cent nicotine sulphate	1 pound
Flowers of sulphur	16 pounds
Water	96 gallons

Mix nicotine solution and sulphur thoroughly, then add water. Do not heat above 105 or 110 degrees.

Berkshire Swine

August 23, W. M. Carruthers, Live Oak.

What can be accomplished in a comparatively short time by a determination to succeed is shown by the progress made by J. F. Lehman, of Lodi, a breeder of Poland-Chinas. In the fall of 1917 he purchased from W. A. Young a pure bred Poland-China gilt bred for March farrow. She farrowed ten pigs, seven boars and three sows which he developed to such a degree that when shown at the state fair in 1918 he won $101 in the open classes and the Poland-China futurity and sold the seven boars for $710, a total of $811 cash returns from the original investment of $75. Mr. Lehman states that he also refused $500 for the three sow pigs which are part of his present herd along with the original gilt. From the original gilt and her three daughters he now has 33 pigs which are mighty good representatives of the breed. His herd sire at present is Smooth Big Korver by Big Korver out of Smooth Beauty, the 1918 grand champion sow, although he has a number of pigs by Golden State King. A younger sire of popular blood lines will be added this fall. Mr. Lehman will consign a number of pigs to the sale in Lodi September 19 and will show at the state fair in Sacramento.

The only fair to be held in Stanislaus County this year will be at Patterson August 21-22-23. The fair will include both agricultural products and live stock. The decision to hold this fair was too late to permit of the erection of proper buildings, but a sufficient number of tents has been secured for the housing of all exhibits. All available space has already been spoken for.

Geo. V. Beckman & Sons, Lakeside Farm, Lodi, are rapidly developing their herd of big type Poland-Chinas and have recently added a number of junior yearling sows to their herd. The herd boars in use are Matchless Big Bob and Lakeside Defender. Matchless Big Bob is a son of Big Bob Orange, a boar used by University Farm, Davis. Lakeside Defender is a Meharry-bred boar being by Chief Defender's Choice, and a litter mate to Chief Defender's Choice 2nd sold in the Meharry sale last fall for $2000. Both of these boars will be included in the show herd this fall along with a number of their get. Lakeside Farm will have out a complete show herd this year and will be exceptionally strong in the senior and junior pig, and young herd classes.

One of the feature events in live stock circles for the month of August is the Poland-China sale at Fresno, to be held by the Fresno County Poland-China Breeders' Association. The sale will consist of 30 bred sows, 17 bred gilts, and eight open gilts. The following well known breeders will be represented in the sale: Wm. Burchard, Kerman; D. H. Forney, Fresno; Buckland & Son, Fresno; W. C. Ficklin, Fresno; Caesar & Son, Reedley; E. Meyers & Son, Riverdale; E. R. Ichner, Selma; Barkena & Son, Fresno; C. W. McCollister, Fresno; W. L. Choisser, Riverdale; J. W. Jones, Carruthers; C. E. Dack, Fresno; I. L. Mason, Fowler; G. W. Pfost, Laton; Vern Fullerton, Selma; H. Askov, Fresno and A. J. Van Cleef, Riverdale. Full details as to the breeding of animals in the sale and the boar to which they are bred will be found in the catalog. W. C. Ficklin.

secretary Bank of Italy Building, Fresno, will be pleased to mail you a copy.

One of the younger breeders of Poland-Chinas in the state is Eugene Miner of Lodi who is devoting a good deal of time and energy to building up a herd of big type Polands. Mr. Miner states that he expects to add a few good young sows and a top boar to his herd this fall. He will not attempt to produce a large number of animals but expects to breed and develop a class of Poland-Chinas that will meet the requirements of breeders and pork producers to such a degree that his stock will have a steady demand. He says he expects to produce better animals and develop them to sufficient age before selling them and that the buyer will then be better satisfied.

W. A. Young, one of the oldest Poland-Chinas breeders in the state, reports the sale of ten bred sows and gilts to Norman F. Eastman of New York City, who is establishing a herd on his ranch at San Fernando. Included in the sale was Smooth Beauty, the grand champion sow at the 1918 state fair, and Timm's Wonder Maid, placed second to Smooth Beauty. Mr. Young states the price received for Smooth Beauty was $750 which he believes is the highest price ever paid for a Poland-China sow on the Pacific Coast. The total sale price was $25000 for three two year old sows, four yearlings and three ten months' old gilts, and was made through Chas. Graham, formerly of the Santa Anita Ranch, who is now in charge of Mr. Eastman's ranch. Mr. Young is planning to add several high class young sows and the best boar he can find.

Elmer Lamb, who, owing to poor health disposed of his herd of Duroc-Jerseys, is again assembling a herd which he expects to develop to such an extent to permit him holding a sale late next year. His only entries at the shows this year will be in the senior pig class and young herd. Mr. Lamb bred and partially developed the boar Orion Model Jr. and the sow Lucy Orion selling in the Belknap sale last March for $1000 and $1100 respectively.

Guy H. Miller, breeder of Jersey cattle, Modesto, will have out a show herd of 16 animals of various ages headed by the four times grand champion bull Altama Interest, a grandson of Interested Prince, one of the famous bulls of the breed. Mr. Miller states that while he has won the grand championship four times with his senior herd sire he hopes to be able to make his record stand at five times when he will he willing to retire him from the show ring. As a junior sire he is now using Jap's Perfection Owl, by Jap's Owl, secured from the well known Meridale Farm of New York.

W. J. Hackett of Ceres will be seen at the fall shows with his show herd of Jersey Cattle. His herd sire Oxfords Majesty's Gold Link will head the herd which will consist of aged cows, senior and junior heifers and senior and junior bulls.

The Rico Vegas herd of Jerseys located near Modesto and owned by C. D. Hayworth will not be seen at the fall shows. This is due to the scarcity of labor and building operations needing Mr. Hayworth's personal attention. One of the hulls now in use as sire is Silken Golden Glow Chief, a grandson of Golden Glow Chief, sire of Viva La France, the world's champion cow for her age. The dam of this bull is Lady Silken Glow, with a record of 882.65 pounds of fat as a senior three year old. All cows are regularly tested and all that have finished test are R. M. cows.

Homer Hewins, formerly of Calistoga, is now nicely located on his farm of 300 acres near Salida. Mr. Hewins expects to develop this farm as a breeding plant for Berkshires and Holsteins and is rapidly rearranging the fields and pastures with this idea in view. Mr. Hewins had the misfortune to lose his Berkshire boar, Remoh Epochal, hy Epochal, last week but he will be replaced in time for fall breeding. About 40 Berkshires make up his present herd.

Frank R. Steel, manager of the Gossard Farms, Martinsville, Indiana, has been visiting the Berkshire breeders of this state. Steel reports that he has just completed a deal for the remainder of the famous Clise Ayrshire herd of Washington. Included in the sale was the bull Peter Pan 50th, considered one of the great bulls of the breed. It will be recalled that about a year ago Clise sold the major part of his herd to the Gossard Farms.

Miller Ranch, Newhall, breeders of Poland-China swine, report the sale of two bred gilts to S. P. Moore, Newhall; a spring boar to W. G. Short, Saugus, and a gilt to E. A. Harding of Los Angeles.

On July 29 80 cars of California cattle were on the Kansas City market. Most of the cattle were from the Imperial Valley and averaged around 1050 pounds. They sold from $11.00 to $12.75 per hundred.

J. E. Thorp of Lockeford will have out two show herds this fall. The Jersey herd will consist of 18 head, including past show ring favorites and Eminent's Wardress, the cow purchased in the Reid dispersal sale for $1200. Jersey interests are looking forward to the appearance of this cow in California show rings, as she is regared by many as one of the rarest types seen in recent years. Besides the Jersey herd, Mr. Thorp will have an excellent lot of Duroc-Jerseys out. He is particularly strong with his junior yearling boar, Freddie You'll Do, a son of Johnson's Defender.

Madrigal Mookie 2nd, belonging to W. J. Higdon of Tulare, has just shown on a 60 day test 213.65 pounds of butter and 5100.22 pounds of milk with a seven day record of 32.66 pounds of butter. Last year the cow broke the state record for milk production for two year old heifers, and her record this season shows 54 more pounds of butter and 900 pounds more of milk in 60 days.

I. G. McCune of Stratford has purchased from Hugh C. Shinn of Tulare a Poland-China boar pig four months old out of Bob's Giantess with Boulder Buster as the sire.

A. J. Elliott of Tulare has sold a boar pig from his $325 sow Big Ann to a prominent Poland-China breeder in Glasgow, Kentucky.

W. H. Bitner of Bakersfield, manager of the California Farm Bureau Marketing Association, has purchased from W. J. Stewart of Tulare for $100 a fine seven months' old Duroc gilt. The pig was the prize winner at the last contest of the Visalia boy's pig club.

W. M. Carruthers, Live Oak, who has the distinction of having held the highest record Berkshire sale in America for the years of 1916 and 1917, will sell 70 head of boars, sows and gilts at his farm near Live Oak Saturday, August 23. Carruthers had exected to show Berkshires at the fall fairs but owing to the shortage of help and the time given over to his recent Shorthorn sale he has decided not to show and will include in the coming sale many of the animals he was preparing. An attraction of the sale will be the selling of the boar Live Oak Champion, reserve grand champion at the 1918 state fair. Col. Ord L. Leachman of Sacramento has been engaged to serve as auctioneer.

Clayton N. Slocum, Willows, junior member of the firm of H. P. Slocum & Son, reports the sale of three young sows and a boar to Mr. J Holly of Dixon. The boar is a grandson of the noted sire, High Orion.

INAUGURAL POLAND-CHINA SALE

OF

Fresno County Poland-China Breeders Association

WEDNESDAY, AUGUST 20

FRESNO, CALIF.

Type and Quality will predominate in this sale

30 Bred Sows 17 Bred Gilts

8 Open Gilts

These are the tops from the herds of 17 breeders and sired by such boars as President, Jumbo's Equal, King's Big Bone Leader, Young Jumbo and Model Fellow.

They will be bred to such boars as Vaughn Jones, grandson of Gertsdale Jones, Hather's Big Bob, grandson of Caldwell's Big Bob, California Jumbo Buster, grandson of Giant Buster, and Blue Valley King, a grandson of King Big Bone.

This is the most popular blood found in present day Big Type Poland-Chinas.

This is a sale you cannot afford to overlook whether you are a breeder or a producer of pork. Hogs today occupy the highest position of any class of live stock in the markets of the United States.

The animals that will be sold in this sale are sure to return a handsome profit for their purchaser.

Sale will be held on Fresno Fair Grounds, starting promptly at 12.30. Lunch will be served at 11.30 A.M.

Write W. C. Ficklin, Bank of Italy Bldg., Fresno, Calif, for a copy of the catalog.

A PORK DAY AT HANFORD

A great deal of interest is being aroused in the fat hog show that will be held at Hanford October 15. For a number of years Kings County has been noted for its pure bred swine and for the enterprise and enthusiasm of the breeders. Having thoroughly established themselves as breeders of pure bred swine they are now devoting time and money in interesting the farmers in better hogs for pork production.

Together with the board of trade and in cooperation with the farm bureau a contest for fat hogs has been arranged between a number of farm centers. To bring the show to a successful issue it was considered necessary that at least five centers compete and that five feeders from each center enter hogs. The plan met with such favor that eight centers have entered and over 800 hogs are on feed. Prizes totaling $1500 have been provided of which $350 will be awarded to the first prize carlot, $100 for the best ten head and $25 for the best single animal.

In addition to the contest a complete display of pork products will be made in which the various packers have been asked to cooperate and to send an expert to assist in the program.

Professor J. I. Thompson of the University Farm has been selected to judge the hogs.

After the hogs have been judged and the prizes awarded they will be sold at public auction through the farm bureau.

TULARE COUNTY HOLSTEIN BREEDERS

Tulare County Holstein breeders have purchased some of the best young herd sires available during the past eighteen months, and several of them are already reaping a rich harvest of choice calves. King Korndyke Pontiac 20th, the bull purchased by W. J. Higdon for $6500, has already sired a wonderful lot of calves, much more than half of them being heifers, and most of the highest record cows in the lower San Joaquin valley have been bred to him.

Sir Aaggie De Kol Acme 2nd, owned by Alex Whaley, Tulare, is developing into a bull of rare individual excellence, and his calves are much above the average. Six out of the first nine dropped in Mr. Whaley's herd are heifers.

King Sadie Vale Idyl Segis, owned by R. F. Guerin, is also developing into a big, strong, straight individual, and his first six calves, five of which are heifers, are choice in every way.

Segis Pontiac Abbekerk, owned by R. C. Sturgeon, Tulare, is already a bull of commanding individuality, and he is only a youngster yet. His first calves are beauties, and most of them are heifers.

King Mead of Riverside 7th, owned by L. D. Bardsley, Tulare, still carries the splendid lines and quality he exhibited as a calf, and while we did not see his first calves we are told that Mr. Bardsley is much pleased with them.

King Sadie Vale Rose, owned by T. J. Gist & Sons, Tulare, is developing nicely himself and is siring as choice a lot of calves as could be desired.

SILO ALMOST AS USEFUL AS BARN

The silo is rapidly becoming recognized as a necessary part of the Minnesota farmer's equipment. A Minnesota farm without a silo, at least in the corn area, is no longer up to date. The rapid adoption of the silo is accounted for by recognition of its advantages. These advantages are summarized by A. D. Wilson, extension director of the Minnesota colege of agriculture, as follows:

If corn is cut at the proper stage and put into a good silo, the whole corn plant is eaten.

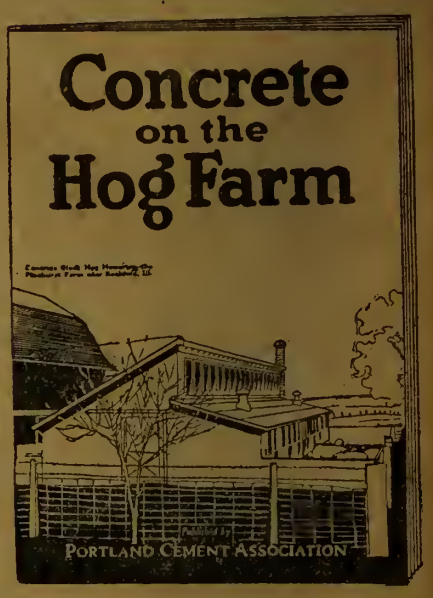
Silage is more convenient to feed than is any other rough feed commonly used on the farm.

Silage is both palatable and succulent.

The addition of a succulent feed to a ration increases the digestibility of the dry feed eaten.

With a silo it is possible to save corn that might otherwise, owing to immaturity, be largely wasted.

Every Hog Raiser Needs This Book



EVERY farm is a hog farm, and you can't make profit certain unless you

farm with concrete.

This book shows all the profitable uses of concrete for the hog raiser, and tells you how to build them—hoghouses, feeding floors, hog wallows, feeding and watering troughs, dipping vats, fence posts, corncribs, smoke-houses, brine tanks. You can't afford to run a hog farm without them.

Write for a free copy of *"Concrete on the Hog Farm."* Address our nearest District Office.

Concrete for Permanence

SIMPLEX SILO

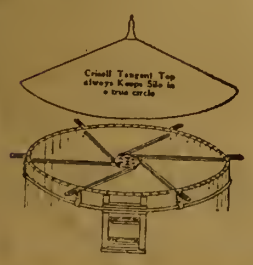
Double Your Dairy Profits

Suppose you had some means of providing a nutritious green feed for your dairy—summer and winter. And suppose it would save you time and worry, enable you to secure double your yearly profits. *What would it be worth to you?* It would be the most valuable thing on your farm, wouldn't it?

That's just what the "Simplex" Silo will do. The "Simplex" is more than a silo. It is the perfect silo. It will last longer, make better ensilage and give more all-round satisfaction than any other. You will never know what a silo really is until you have owned a "Simplex."

Construction of the Simplex

The "Simplex" silo is constructed of two things —*perfect lumber and common sense.* A silo built of spliced staves will leak. *Why?* Because it is impossible to join two staves and make the union as solid as the wood itself. Therefore the *"Simplex" has no joints. Staves are one piece.* No chance for a leak. Extra heavy tongues and grooves with new steel hoops make the *"Simplex"* an ever solid silo.



The Interlocking Anchor System and the Crisell Tangent Top keep the "Simplex" always in a true circular outline. Absolutely will not sag, twist or blow over. Write for blue prints of the "Simplex." Get our illustrated circulars and find out more about how to increase your profits.

Why wait for your neighbor's ensilage cutter while your crops are spoiling in the field? A week or even a day may mean a loss of several hundred dollars to you. *Own a "Papec."* Have a cutter when you need it. Fill your own silo at the right time.

The "Papec" is built strong. Solid steel frame. Easily and quickly taken down and put together. Knives and fans are on one wheel. It operates with less power than any other. We guarantee it to cut and elevate more ensilage than any other cutter made with the same power.

Let Them Make Money for You

The Simplex Silo and the Papec Cutter are a money-making combination. We guarantee both to be as we claim. Prompt refund of purchase price if either falls short of our statements. Write for descriptive matter. Let us show you more about the "Simplex" and the "Papec." Write today.

Six Year Old Boy Best Pig Raiser

By Frank B. Anderson, Secretary Western Berkshire Congress

Donald Pineo, a six year old boy of Del Paso Heights, could show some old folks a few pointers on pig raising, judging by the results obtained in the Boys' Pig Club contest just closed. This little tot—hardly big enough to carry a feed bucket—showed the best pig in the class, the greatest gain at the lowest cost and the highest net profit with his pure bred Berkshire sow pig. Donald, however, was nosed out of first place in the contest because he was not able to write an essay on how he conducted his feeding, management, etc., as provided in the Pig Club rules, so Walter Graham, an older boy showing two pigs, won second place on one of the gilts. His pig will go to the state fair, showing in the Pig Club class and also in the breeders' classes.

A marked interest in the raising of more and better pigs has been created around the communities in which these pig club contests have been held. By securing good registered Berkshire sow pigs the boys will continue with a contest to see who can raise the best litter of pigs. Many of these pigs are on farms and suburban homes that never before raised hogs.

The Del Paso Heights pigs were judged by Jack Finlay before an interested crowd of farmers, including the parents of the young hog raisers. Pointers on the care and management of the sows as they approach breeding and farrowing time were given by Finlay, and it is likely that some of these children will get started along lines that will prove highly profitable.

While the cost basis for this club work has been placed at pork prices, the nicely developed gilts could realize the children some handsome profits. The top pigs of the contest would easily bring $100 at any breeders' sale. These pigs were bought by the boys and girls with money loaned on their notes by the California National Bank of Sacramento.

The first and second pigs were December gilts from the James Mills Orchards Corporation, and the third was a February pig from the herd of A. B. Humphrey.

The results of the Del Paso Heights Club contest were as follows:

DEL PASO HEIGHTS CLUB

Name	Fed Days	Pounds Gain	Average Daily Gain	Cost Feed & Labor	Cost Pig	Value Pig	Net Profit
Donald Pineo	120	137½	1.14	$10.49	$11.00	$35.80	$14.31
W. E. Graham (2)	120	228	1.90	19.93	23.75	63.40	19.72

Some Pig Raiser Though Only Six

Donald Pineo, six years old, and his first prize pure bred Berkshire pig in Del Paso Heights Boys' Pig Club contest.

Leonard Backer again topped the Franklin Club contest, having repeated his performance of a year ago. While he did not show quite the large gain that two of the other contestants did, he proved to be a more economical feeder and turned out the best profit.

The pigs in the Franklin club contest were registered Berkshires from the herd of the Superior California Farm Lands Company of Willows, and the placings made by J. L. Thatcher, who judged Berkshires at the 1918 state fair: The Franklin results were as follows:

FRANKLIN PIG CLUB

Name	Fed Days	Pounds Gain	Average Daily Gain	Cost Feed & Labor	Cost Pig	Value Pig	Net Profit
Leonard Backer	120	145.0	1.21	$12.76	$ 8.00	$35.00	$14.24
Harry McKenna	120	157.5	1.32	16.62	9.62	38.80	12.56

Don't Let Your Stock
Lose their early Summer Gain through neglect now

Pasture is getting short. Your animals must go on dry feed—hay and grain. It's a big change from the succulent, nutritious grasses of summer which supply the needed laxatives and tonics.

Keep your animals' bowels open and regular—drive out the worms—keep their blood rich—keep their digestive apparatus in order—by feeding Dr. Hess Stock Tonic.

A Conditioner and Worm Expeller

Don't allow your stock to "get off feed" and in a rundown condition. Dr. Hess Stock Tonic eliminates waste and gives appetite, good health and good digestion. It enables animals to get the most benefit out of their feed.

Buy Stock Tonic according to the size of your herd. *Here's a suggestion for your guidance:* Get from your dealer 2 pounds for each average hog, 5 pounds for each horse, cow or steer, to start with, feed as directed and then watch results.

Why Pay the Peddler Twice My Price?

You buy Dr. Hess Stock Tonic at an honest price from a responsible dealer in your own town who guarantees it, and who refunds your money if it does not do as claimed.

— Public Sale —

Live Oak, Calif., Saturday, Aug. 23

70 Head of Boars, Sows and Gilts 70

The offering to be sold on the above date is in every way up to the high standard set by my former sales and will consist of boars, sows and gilts of a character to suit any buyer—the established breeder, the beginner or the man wanting one or more boars to increase the profits from his pork operations. Every animal sold has been immunized against cholera and swine plague by Purity anti-hog cholera serum and mixed vaccines. You run no risk. All are sired by one or another of my famous herd boars—AMES RIVAL 100TH, LIVE OAK CHAMPION and MAYFIELD SUPERBUS.

The sale includes three out-standing show sows; 12 under-a-year sows; 20 young gilts; 30 boars, among them at least 10 high class herd boar prospects.

Two Herd Boars Sell

I will also sell the two-year-old boar LIVE OAK CHAMPION, reserve grand champion at the 1918 state fair, and Mayfield Superbus, a son of the great Superbus. Two better boars will not sell this year.

Butte City Ranch Sale a Success

The big sale held at the Butte City Ranch, Butte City, Saturday, August 2, attracted one of the largest crowds ever seen at a public sale in Northern California and proved to be one of the most successful sales. Few sales have resulted in starting more new breeders. Many men bought their first registered Shorthorns, Berkshires and Shropshire sheep, and in view of the fact that the purpose in mind was to distribute registered foundation animals to as many beginners as possible the owners, Messrs. Dwyer and Guilford, were particularly well pleased.

A better setting for a sale or more complete arrangements for the comfort of the guests would be hard to imagine. The sale was staged in a beautiful grove of oak trees that completely shaded the sale ring throughout the day. At an early hour automobile parties began to arrive and by the time the sale was called the parking place was jammed with cars. The cattle, hogs and sheep were stalled and penned in convenient manner and were presented in pleasing condition. The sale started at 11 o'clock. Fifty head of Berkshires, all young stuff, were snapped up in quick order for an average of $38.50 per head, a very satisfactory valuation considering the age of the offering.

The Shorthorns were offered immediately after lunch. They had been selected with particular reference to the needs of the beginner, only a few mature cows being catalogued. By far the major part of the offering was made up of heifer and bull calves selling as single lots. This fact necessarily cut the apparent average as in most sales of the kind, cows and calves sell together. The reason for the departure from the usual method of selling was to provide for the new breeder. The heaviest individual buyer was Chas. Silva of Sacramento. Mr. Silva is just entering the business and expects to establish a good herd on his farm near Sacramento.

President Lowe of the Jackson County, Oregon, Live Stock Breeders' Association was a persistent bidder on nearly every lot.

Twenty-five cows and calves sold for an average of $504. Ten calves, selling separately sold for an average of $187.

The sale of Shropshire sheep attracted buyers from a wide territory. The sheep were sold in lots to suit the buyer. The entire lot, ewes, rams and lambs averaged near $50 a head.

The sale was managed by C. L. Hughes of the California Breeders' Sales & Pedigree Company, Sacramento. Col. Ben A. Rhoades of Los Angeles wielded the hammer over the Berkshires and Shorthorns and Col. Geo. W. Bell of Tulare took the bids from the ringside and was on the block when the sheep were sold. Much credit for the success of the sale was due the management and the auctioneers.

The sale just held and the future sales planned will mean much to the live stock interests of Glenn County in particular, and the Sacramento Valley in general. A detailed list of buyers of Shorthorns appears below:

Shorthorns

FEMALES

1. Alexandria Maud 3d, Nov., 1915 and C. C.; Chas. Silva, Sacramento, $550.
3. Maplehurst Beauty, Aug., 1, 1912; Chas. Silva, $375.

47. Typical Sultan, Dec., 12, 1918; C. C. Conroy, $135.
48. Red Skin, Nov., 1, 1918; Jackson Co. S. H. B. A., $150.
49. Diamond Splendor, Dec. 19, 1918; Chas. Silva, $125.
19. Snow Bank, Feb., 1919; Chas. Silva, $500.

NOTES ON THE BUTTE CITY SALE

Chas. L. Silva of Sacramento was the heaviest buyer of Shorthorns. He secured 25 head of cows and calves and a number of bulls. Mr. Silva is starting a breeding estabishment near Sacramento. He also was a heavy buyer of sheep.

President Lowe of the Jackson County Shorthorns Breeders' Association, one of the progressive organizations of Oregon attended the sale and selected 12 head of Shorthorns. The cattle were bought in the name of the organization and it is planned to hold an auction sometime this fall and distribute the cattle among the members.

Frank Brown, Western representative of the American Shorthorn Breeders' Association, attended the sale and made a short talk on present values being registered in the breed. Brown is president of the Pacific International Live Stock Exposition.

William Bond of Newark was a persistent bidder on the better Shorthorns. Bond also purchased one of the top Berkshire boars.

A Butte City Shetland pony was sold at private sale for shipment to China.

F. W. Leavitt of Willows; Porter and Jones of Butte City and R. S. Seydel of Lincoln were the principal buyers at sale of Berkshires.

The demand for the registered Shropshire sheep was especially keen

Pests of the Poultry Yard

By Jean A. Koethen

IF every insect pest which preys on our domestic fowls could suddenly be eliminated the life of the poultryman would be vastly easier. What with the lice that are always present when they are not guarded against—and often when they are—to tickle and bite; what with the mites of various species, which always lie in wait to suck her life blood or find a home under her skin; what with the worms that may, when not discouraged, infest almost every part of the digestive tract, and sometimes the respiratory organs as well; what with the ticks the walls of her home may harbor, and the fleas that infest the litter she scratches in and sometimes the very ground she walks on, ready to spring upon her, the lot of the poor laying hen, confined as she is by wall and fence, is far from desirable. When she is allowed to range she may find means of defending herself. Shut in, she is helpless save as human hands bring her relief.

So far as I know no estimate of the loss these pests inflict yearly on the poultry industry has ever been published, but it must run into the hundreds of thousands of dollars. When we consider the countless numbers of chicks that fall a prey to the blood-thirsty red mite, the thousands of chicks and turkeys that go down before the onslaughts of lice, and the thousands more that drag out a miserable existence because of the depredations of round worms and gape worms, only to give up the fight at last, to say nothing of the adult fowls that yield sooner or later to the persistence of their insidious attacks, it is easy to imagine how great the total loss may be. Many poultry plants, to be sure, are so carefully guarded that vermin never enter. Many more lose only an occasional bird from these causes. The greatest loss is probably among beginners who do not fully realize the number or perseverance of these foes, and on farms where the chickens are left to shift for themselves to a great extent.

The Lusty Louse

A single pair of lice, it is said, allowed to reproduce unhindered will breed 125,000 more in eight weeks. If you examine a hen that has not been dusted or greased for some time you can easily distingulsh the different generations of lice about her vent by their size. Imagine the sufferings of a hen on which 125,000 lice are crawling. How can she possibly be a producer when her vitality is drained by such constant tickling and biting? A hen that is dusted occasionally and allowed a dust bath where she may wallow daily may not be absolutely free from lice, but she is not greatly inconvenienced. It is the hen that is never dusted that after a while begins to droop and grow pale of comb and rough of plumage. She may live on for months or even years but she does not produce.

Chicks and young turkeys are much more susceptible to attacks of lice, especially of head lice, and are frequently killed by them. Ducks and geese have each their own species of louse, which are negligible in their effect on the birds.

Treatments for Lice

Dusting, dipping and greasing are the three methods of treatment. Many good louse powders are on the market, but none better than the Lowry powder recommended by experiment stations and easily made at home. It consists of 3 parts gasoline and 1 part crude carbolic acid or cresol, with enough plaster of Paris added to take up all the gasoline. For dipping use a 5 per cent solution of creolin, Zenoleum or Kreso dip. Blue ointment, diluted with an equal amount of vaseline, is used by many for greasing around the vent, but it is poisonous and must be carefully handled.

Young chicks should be greased on the head and under the wings with pure lard or dusted thoroughly with buhach or pyrethrum insect powder. Baby turkeys should be dusted with one of these powders as soon as they are put in the coop, and once a week thereafter.

The Mighty Mite

The common and troublesome mite is the little red mite (derbanyssus gallinae) which hides under the roosts and about the nests of all poultry houses that are not frequently sprayed or painted with some insecticide. There are two varieties of these mites, and both are called "chiggers" or "juggers" in some parts of the country, but they have the same characteristics. They are grey when empty, blue or red as they become filled with blood, and are seen as little fine gray patches or splotches where they breed. They are rarely found on the body of the hen in daylight, but swarm over her at night by the million, filling their greedy bodies with her life blood.

Treatment for Mites

The following are tested solutions for painting or spraying the walls and roosts of poultry houses. It is a good plan to use the garden hose before the insecticide is applied.

Five per cent carbolic acid solution in water.

One per cent Napthalene in kerosene.

Pure crude carbolic acid.

One per cent Kreso dip.

Two per cent Kreso dip.

Ten per cent crude carbolic acid in kerosene is also effective, and there are a good many cresol preparations. Carbolineum is recommended by the Storrs experiment station. All coal-tar preparations are good, but they must be applied with thoroughness to make sure that every bit of the infested surface is touched and used early in the day that the fumes have time to evaporate before the birds go to roost.

The Scaly-Leg Mite

Different in its character and mode of attack, but still a mite, is the parasite which causes scaly legs or foot mange. It attacks both chickens and turkeys, burrowing under the scales of the legs until at first small blisters and finally large scaly masses appear, and while it is readily passed from bird to bird, always originates in filthy yards. These scales are treated by soaking the legs in warm soapy

POULTRYMAN'S CALENDAR—AUGUST, THE VACATION MONTH

Strictly speaking, the poultryman never gets a vacation. Nevertheless, there are times when he can slack up a little and of these August is the best.

Feeding is a task for 365 days in the year, but feeding in August can be left to any one with sufficient intelligence to follow directions. It calls for obedience, not for discretion. The pullets are on laying rations, early cockerels marketed, the most conspicuous slackers culled out. Now is the time for father and mother to leave the boys and girls in charge and slip away for a breath of sea air.

Now is the time to put the breeders on green, shady range and let them take life easy while they molt.

Now is the time to put the fat hens on a light ration of greens and bulky food, and train them down.

Now is the time to put the pullets that are maturing too rapidly on a maintenance ration of bran and beef scrap in order to delay too early production and consequent fall molting.

There is always something to do, but if we can't go easy, let's go as easy as we can.

water, then scrubbing with gasoline, kerosene, kerosene emulsion, or lime and sulphur dip which is made by mixing 1-3 pound unslaked lime, 1 pound sulphur and 4 gallons water. This is boiled two hours and the amount lost by evaporation made up by adding water. A more simple remedy is equal parts lard and sulphur, rubbed well into the legs after they have been softened by soaking. This must be repeated several times to be effective.

Ticks and Fleas

The chicken tick (Argas miniatus) and the chicken bug or dove-cote bug (Acanthia inodora) are both blood suckers, but the chicken bug, or bed bug of poultry as it is called, lives on roosts and walls and in the nests, coming out at night to get its living from the body of the chicken, while the tick not only lives in the house, but sometimes is found on the body of the chicken as well. Both these pests, which fortunately find a foothold only in very filthy and neglected houses and then not in all localities, must be combated by strict sanitary measures. They are rarely if ever found in houses that are frequently sprayed or painted, and any of the preparations which prevent mite infestation ought to keep out ticks. Ticks on the body of the bird are sometimes killed by touching each tick with a feather or brush dipped in corrosive sublimate, but this is a troublesome and rather dangerous operation, and it is probable that any of the dips recommended for lice would have the same effect. When a house is once infested with ticks it is very difficult to get rid of them.

The ordinary chicken flea is seen only occasionally in California. When found on the bodies of the fowls it may be destroyed by dipping in any of the preparations recommended above, and a thorough cleaning and disinfecting as for mites will usually keep them out of houses.

The stick-tight flea, which is found particularly in sandy soil and lives by burrowing into the combs and wattles of the birds, where it sticks tight and sucks the blood, is successfully treated with repeated applications of lard or vaseline. A little sulphur may be mixed with the lard, but grease alone usualy kills the fleas.

Worms

Of the numerous species of worms which inhabit the intestines of fowls only two need be mentioned here, round worms and tape worms. The round worm, which is most common, has been successfully treated at the Davis University Farm by mixing tobacco dust in the dry mash in the proportion of 1 pound of tobacco dust to 50 pounds of dry mash. This may be left before the birds till all traces of worms have disappeared. This remedy is far more easily used than the time-honored dose of oil of turpentine and is said to be more efficacious. Tape worms are treated by giving ½ tablespoon of Epsom salts, and following this two or three teaspoons of turpentine. A few teaspoons of a decoction of pumpkin seeds followed by a heaping teaspoon of Epsom salts is also recommended, as is powdered areca nut in 3-grain doses and thymol in 1-grain doses.

A parasite known as the gizzard worm is sometimes found in the walls of the gizzard. It is treated with turpentine and olive oil, a teaspoon of turpentine followed by a tablespoon of olive oil, or by the tobacco treatment recommended for round worms.

The gape worm, which often finds its way into the wind pipe of young chickens, causing strangulation and death, comes from contaminated soil and can only be treated by removing with a looped or doubled horsehair or with a feather from which all the barbs but the tip have been removed. Force the feather or horsehair, which has been previously dipped in turpentine, down the throat past the worms, then give it a quick twist and withdraw. This generally loosens the mass of worms.

Plumbing is becoming a necessity in both city and country homes, not only for comfort and convenience but even more for health and cleanliness. It also provides for the proper disposal of the wastes of the household, which should by no means be neglected.

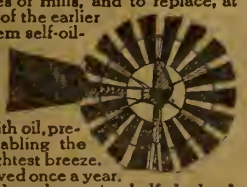
THE SELF-OILING WINDMILL
has become so popular in its first four years that thousands have been called for to replace, on their old towers, other makes of mills, and to replace, at small cost, the gearing of the earlier Aermotors, making them self-oiling. Its enclosed motor keeps in the oil and keeps out dust and rain. The Splash Oiling System constantly floods every bearing with oil, preventing wear and enabling the mill to pump in the lightest breeze. The oil supply is renewed once a year. Double Gears are used, each carrying half the load.



We make Gasoline Engines, Pumps, Tanks, Water Supply Goods and Steel Frame Saws.
Write AERMOTOR CO., 2500 Twelfth St., Chicago

ENERGE-DECARBO
The Great Gasoline Tonic causes motor by complete combustion, to use all of gasoline; no carbon, 25 per ct. more power and miles to gallon. Keeps your car "right" at low cost. $1.00 worth treats 100 gal. Ask for details
CONSERVATION PRODUCTS CO.

ECLIPSE
38 years old-still pumping
$1.65 a year

ECLIPSE WINDMILLS erected 38 years ago are still pumping water, with no repair bills. A reliable water supply year after year at a cost of $1.65 a year figured on a 38 year service basis.

The ECLIPSE WOOD WINDMILL has been sold for 50 years, always giving wonderful service. It is sensitive to light breezes — practically storm-proof. Requires only occasional oiling—has direct stroke—no gears—but little friction—noiseless.

See your dealer and have him prove these claims to you.

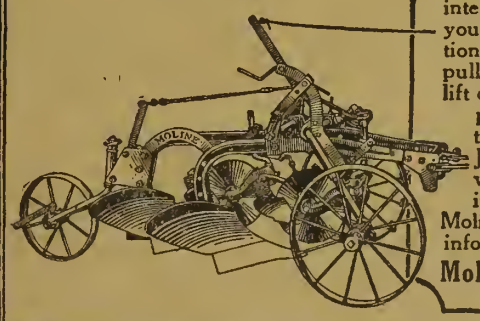
MANUFACTURERS CHICAGO

MOLINE
Power Lift
GANG
NO.11



YOU get real satisfaction from your tractor and a real job of plowing when you use this Moline Plow. It has improved positive power lift device which saves power, time, and enables better work to be done. To raise the plows pull the cord until the power lift lever locks, and the plows are raised without further attention. If you want to raise your plows, just an inch or two or any intermediate distance, to relieve your tractor or clear an obstruction, you can do so by a slight pull on the cord. This is the only lift on which you can change the plowing depth without raising the plow out of the ground. Just one of many features which will make your plowing easier and better. See your Moline Dealer or write for full information.
Moline Plow Co., Moline, Ill.

Questions and Answers

ANSWERS BY EDITOR AND STAFF

Questions to be answered in this department should be received at the office one week before reply is expected. Write plainly on one side of the paper and sign full name and address. Unsigned communications receive no attention.

Snuffles

This winter a few of my rabbits began to sneeze, then more were affected until now half of them show the same trouble. Pens are on the ground and large enough so they have plenty of room to run. When they sneeze a whitish discharge comes from their nostrils and they rub their noses with their feet. They look fat and eat like hogs. Do you think they have the snuffles?—Subscriber, San Luis Obispo.

This query was referred to W. E. Lloyd of the University of California, and he answers:

"This is undoubtedly snuffles. Snuffles is, in the beginning, merely a cold caused usually by improper housing or improper sanitation but there might be many causes for the condition. Snuffles develops from neglect of the cold, and the thin discharge from the nostrils becomes a thick mucus, which is the most difficult of all rabbit diseases to cure and is highly infectious. The animals should be kept in a warm hutch free from drafts and a mixture of ten drops of creolin to one ounce of olive oil kept on hand. Four drops of this preparation should be added to each nostril once a day. This may be done with a small machine oil can. If the discharge is very bad it will also be well to wash the nose in warm water, to which a few drops of vinegar has been added, before applying the creolin and olive oil.

Trees Out of Condition

1. What is the cause of yellow, dying leaves on ten year old apple trees at this season, which otherwise seem vigorous? Not all the trees are so affected. 2. The orchard does not produce much, though tilled each year. It has no irrigation. It is situated on the side of a hill but the soil is deep and holds rain moisture well. The trees make good growth each year, usually being filled with bloom though they did not have many this year, but these blossoms fail to produce apples. Have not fertilized but planted intercrop of Blackeye beans in a portion of the orchard for the past two years. A portion of the same slope is in 'cots, peaches and prunes which do well every other year. We have also a few walnut trees which this year have a very scattering, irregular crop, although trees appear healthy.—Subscriber, Alpine.

The answer to the first question is as impossible to give with any degree of accuracy as is the question as to what causes a pale face in a human being. In that case it may be simply a sudden fright or it may be constitutional. However from the second question, or rather statement of conditions under which these trees are growing, we would guess that this orchard is suffering from lack of moisture. No matter how fine a soil is to retain moisture, when the rainfall is as short as it is this year there is little or no water in the lower depths to be retained and the intercrop which was grown has presumably exhausted that little moisture. In a year of such shortage of moisture the planting of intercrop should have been postponed until another year and every attention given to the conservation of the moisture for the use of these trees. Presumably next year's crop will be very light. This because the lack of moisture of this year will prevent the securing of sufficient vigor for the buds which are now forming for next year's crop. It takes fall moisture to give vigor to next year's growth. Many blossoms with little vigor will probably set an exceedingly small crop of fruits vigorous enough to mature.

Renewing Strawberries

Will strawberries bear just as well the fourth year as they do the third, or should they be plowed under after the third year,' and a new patch planted? When is the best time to plant? What is a good fertilizer and when should it be applied? — Subscriber, Pomona.

No, if made to produce to the limit for three years strawberry plants will be so reduced in vigor by the fourth year that they will not produce as heavily as the third year. Planting is usually done in December or January. The best fertilizer is stable manure. We have known of magnificent returns on the investment to come from the application of 100 tons of stable manure per acre. It should be put on the ground and plowed under some months before planting time. Fertilizing of strawberries after plauting is not generally satisfactory.

The application of 100 tons of manure per acre calls for intensive culture, in fact, intensive gardening knowledge, to justify. It is only mentioned as an instance of what one man did and made money in the doing. A much smaller application will yield good returns.

This Month in the Ornamental Garden

Southern California

THE one thing necessary to put into our soil this month is water. There has been no season for years when the garden required such constant irrigation. If water is under pressure, don't sprinkle, at least not as a rule, but lay the hose on the ground or conduct the water in ditches. We will not say that the water goes twice as far when used in this way, but certainly it is much more economical. A few days of neglect or withholding water supply during August means destruction of vitality and beauty, even loss of life of many plants.

Let the cultivation be thorough, though shallow, and if possible to apply mulches they aid in lowering the soil temperature and holding the moisture.

Seed for hardy perennials may be sown. Most varieties sown now will flower next year. Amongst these are cineraria, columbine, calendula, marigold, Canterbury bell, pansy, primula, petunia and even verbena. By the way, verbenas give good return for the effort expended on them, and by a little care the planting may be increased, once the color is known to be satisfactory, through rooting of runners.

Leave roses alone this month. Withhold the water until September. Dahlias call for an immense amount of water these hot days. If they are not sufficiently supplied they wither and look as if a fire had scorched them Where tips have been injured by drouth they may be renewed by cutting back severely, giving liberal supply of water and fertility, and be sure the watering is kept up. You will be well repaid by the wealth of bloom which comes when the sun does not burn so fiercely. Chrysanthemums are not looking at all attractive this month, but constant and regular watering is required if much bloom is to be expected later.

Northern California

By A. R. Gould

AUGUST is usually a trying month in this section, and while the water problem is one which must be met it is necessary to know just where to save and still be able to retain the stock for another year. Where it is necessary to conserve, careful note should be made of such flowers as have perhaps done their duty for the season. Certain perennials which flowered early in the year may now be rested and will require hardly any water. Then well established beds of ivy, periwinkle or vinca, etc., may also be given less water. Roses after being cut back can very well do without water for several weeks if there really is lack of water while lippia lawns will also stand a considerable dry period, but on no account should newly planted beds of lippia or new lawns of grass be dried out; they need constant sprinkling. Then again all plants having thick succulent leaves, such as cactus, will live for many months without water, and it is foolish to waste water on them. All these pointers are important and a little practical knowledge will go a long way towards solving the problem of water. The more foliage a plant has to support the more water it will require, and you can use your judgment accordingly. It is also as essential to make careful records of plant pests in this department as is the case in the vegetable section as mentioned elsewhere. There is always scope for investigation and while our state and federal officials of the horticultural and agricultural departments do their best to control serious pests assistance from garden owners with regard to data obtained is always welcome, hence the need for constant vigilance.

The most troublesome this month among the insect pests are caterpillars, red spider, green and black aphis and mealy bug, and these can be controlled by spraying. The first named may be poisoned by lead arsenate and red spider by a sulphur spray; aphis and mealy bug, by a strong nicotine solution to which soft soap has been added.

Seed Collecting

While it is not always possible to save seed of every subject grown nor is it worth while as it is the business of the seedsman to keep the seed pure and flowers true from seed, as they have the facilities to do, it often happens that we are anxious to secure certain colors and strains of a particular flower to grow a quantity of plants for next season. Then it is that we preserve the type. Some plants produce seed much more freely than others. Seeds of the following may be collected now: delphiniums, columbine, geum, myosotis, viola, pansy, stocks, and gaillardia.

Dahlias

Tubers of these may now be hard to secure, but there is still time to plant, and strong beautiful seedlings may produce flowers this year. Pinch out the small buds on the older plants allowing only one to develop at each point. This method will produce larger flowers. On young shoots just coming through the ground it will be necessary to guard against cut worms.

Hanging Baskets

At this season of the year these baskets, especially if planted with asparagus sprengeri fern, will need watering at least twice a week with liquid manure as they become impoverished. New baskets may also be planted with the trailing lobelia, ivy geraniums, or lotus. The soil should be fairly rich and layers of moss put around inside the basket. The baskets may be of wire or rustic wood.

Propagation

The following may be propagated by cuttings: geraniums, heather, privet, mesembryanthemum, roses, streptosolon, ivy and vinca. Sand is an excellent rooting medium and they should not be placed in the full sun.

Subjects for Shady Places

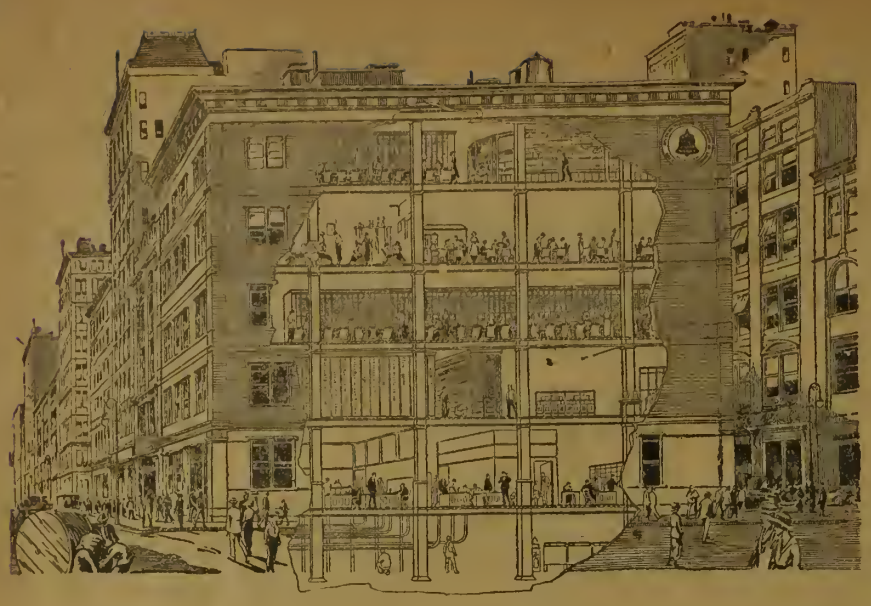
Cinerarias take first place in this class as they are more than useful. Seed of these should now be sown in seed beds of fine soil and later they may be transplanted. Polyanthus, or primulas, are also very good subjects and may be sown in shallow boxes. Digitalis or foxgloves are charming shade loving subjects and may be sown at once.

Sweet Peas—Winter Flowering

This new type has become very popular for winter decoration and the following varieties may be sown now: Early Snowflake, Mrs. A. A. Saach, Christmas Red, Marrawa and Early Morning Star. Sow in deeply manured trenches.

Chrysanthemums

These will need plenty of water and twice weekly an application of liquid manure. For specimen flowers the plants will require disbudding, leaving the terminal bud to develop. Spray for aphis with Black leaf 40.



The Great Task of Construction

With the coming of peace the Bell System faced an enormous construction program. Conditions arising from war resulted in the wiping out of the reserve equipment normally maintained, and necessary to give prompt connection to new subscribers. The release of industry and accumulated growth of population now makes telephone demands almost overwhelming.

Telephone construction, including buildings, switchboards, conduits, cables and toll lines, must, from its inherent nature, be undertaken in large units. A metropolitan switchboard, with its tens of thousands of parts, may require from two to three years to construct and install.

Only great extension can meet the present excess burden of traffic and provide for future requirements. Extension which cares for immediate demand, only, is uneconomical and calls for continuous work of such a character as to be frequently detrimental to the service.

During the war the Bell System devoted all its margin to the needs of the Government. The great task of getting back to normal prewar excellence of operation requires the reestablishment of an economic operating margin capable of taking care of a larger growth than has ever before confronted the Bell System.

Construction is being pushed to the limit of men and materials; while every effort is being made to provide the best, present service.

Household Department

PIRATE, THEN AND NOW

In days of old the pirate bold
Who sailed the open main
Swept aft and fore good ships galore
That promised golden gain.

He led the life, with chase and strife,
Of a man who knew no fear;
'Twas the golden age, tells many a page
Of the bullying buccaneer.

Alas! today the pirate foy
Is of a different breed;
Himself well hid by the market lid,
He gluts his grasping greed.

Our robber sly, with the hungry eye,
Works guile in place of gun;
Of schemes unspeakable the sneak
Is full from sun to sun.

The widow's loaf this crawling oaf
Lifts with a crafty wink
And boosts the price, from ice to rice,
Of a Nation's food and drink.

The clothes we wear, our gloves, per pair,
The shoes that tramp the land,
All things in line pay tribute fine
To the Knight of the Hidden Hand.

If stand we must, despite our trust,
Some robber on our track,
Speed this one's end, and, pitying, send
The old-time pirate back.

—E. W. O.

HOUSEHOLD PESTS

FREEDOM from household pests is chiefly a matter of house cleaning or rather of a clean house. Well screened windows and doors will keep out flies and mosquitoes and thorough cleaning and airing of dark corners will discourage most of the other pests.

Ants

This year seems to be especially favorable to the ants, many reporting that they are literally carrying away whole jars of marmalade or other sweets and are especially persistent in attacking meats. Constant attention given to them, however, makes them very easy to control.

As soon as they appear observe their trail and follow them to their hole. Boiling water or a teacup of gasoline poured in the hole will end the attacks from that particular source. Possibly a better destroyer to use in this way is a solution of cyanide of potassium. The fumes which arise from the solution of, say, 1 ounce to 1 pint of water are very effective.

Note also Formulas 23, 24 and 25.

A solution of corrosive sublimate in wood alcohol wiped around shelf edges, floors and windows is a good repellant. One or two applications during the season are sufficient.

Another repellant which will absolutely keep ants out of the house, if used persistently, is buhach. It's a California product and if kept on convenient shelf in small bellows duster it may be blown about the shelves and rooms in such fine dust that it is scarcely visible when it settles on the floor. This treatment must be given almost daily for the repellant power is soon lost.

There are pastes, and syrups and sprays put up as regular trade preparations which are most effective. When using pastes, and syrups do not be impatient. Give them time, for their effectiveness is not in poisoning of the ant which carries them away but the young in the nests.

Flies

Swat the fly. Keep a swatter on a convenient nail and dispose at once of every fly that passes the screen. They are disease carriers, breed with awful rapidity and have no place in the human habitation. So long as life itself may depend upon it, it is worth while to keep screens in perfect repair.

Sticky fly paper and poisoned fly paper are effective traps. About the barn or dairy big fly traps should be maintained.

Flies may be killed in rooms by burning fresh buhach or by dropping a little carbolic acid on a hot shovel. A 2 per cent solution of formaldehyde makes an excellent fly poison. Add to it a bit of sugar to make most effective.

Mosquitoes

Mosquitoes will breed in any standing water, whether it is cesspool or a few tiny drops in a rusty tin can, therefore do not let water stand anywhere in summer time. The cesspool may be made innocuous as a breeding ground by pouring a little kerosene down the pipe. Mosquities will not deposit eggs on the surface of water that is kept in motion; therefore, tanks holding drinking water may be made mosquito proof by keeping the surface of the water agitated by a small wheel connected with the windmill. Pools should be drained where possible or should have a thin film of crude oil and kerosene, half and half, poured over them occasionally. This will destroy eggs and larvae. Screens at doors and windows of course are the best means of keeping mosquitoes out of the house. Concentrated ammonia neutralizes the poison of the bite.

Fleas

If floors are washed with hot soap suds containing a little kerosene or gasoline and rugs shaken and aired frequently there is little likelihood of fleas overrunning the house. An excellent flea trap is made by a sheet of fly papr in the center of which is placed a small bit of raw meat. Where cats and dogs bring fleas into the house rubbing fresh buhach into their fur will stupefy the fleas so that they will drop off If an old newspaper is placed under the animal while you are treating it the fleas may be gathered up and burned.

Frequent baths for the pets help to keep them free of fleas. Fleas breed rapidly in dust in cracks in floors or similar places. Where animals are seriously infested creolin may be added to baths. This is a commercial preparation to be had at any drug store. Use at the rate of 4 teaspoons to 1 quart of water; if large quantity is wanted, 2 per cent solution.

Cockroaches

Cockroaches, water bugs and black crickets are always attracted to dark or damp places about the plumbing. Fill all cracks with cement or dust with chloride of lime, powdered borax or fresh buhach.

Moths and Buffalo Bugs

Moths and buffalo bugs (carpet beetles) sometimes drive the most careful housekeeper to desperation. Clean, air and dust as you will the pests keep coming. The only way to save woolen clothing hung in closets is to inspect frequently, shake and air. Every closet should have a window if possible, and the window should be opened often. Woolens or furs that are to be packed should first be thoroughly sunned and aired, then wrapped tightly in paper. If boxes are used all openings should be pasted with strips of paper. Boxes lined with tarred roofing paper are moth proof. Woodwork of closets should be wiped with water to which a little turpentine has been added. Benzine or kerosene sprayed in cracks will kill the pests.

The Buffalo bugs or carpet beetles tuck themselves away in dark cracks in the floors or behind baseboards. Hot water, kerosene or benzine poured into the cracks will destroy them or it is better, of course, to fill up cracks with paint or putty, or something of that nature. Both moths and carpet beetles may be trapped in closets by laying old woolen cloths on the floor and frequently collecting and burning.

Meal Moths, Worms, Weevils, Etc.

Unless eggs of these pests already exist in meal or flour there will be no trouble from them if foods are kept in dry, tightly closed receptacles. Once they have entered about the only treatment possible is fumigation with carbon bisulphide. In fumigating a barrel of flour, for instance, place one-half to a full teacup of carbon bisulphide on top of the flour and cover tightly. No light should be brought near during the process of fumigation as the gas given off by this liquid is very inflammable. The gas is heavy and will penetrate down through the contents of the barrel. In very severe infestations a second tratment may be necessary. This treatment is also effective for weevils in peas or beans. It does not in any way harm or affect the food value of the materials treated.

Rats and Mice

When one is building concrete foundations and proper precautions reduce

the mice pest to a minimum, but at times they will follow the human into his habitation. Next to a cat the best mouse catcher is the small five cent spring trap which is sure death. It is worth while to keep these set at convenient places. A bit of Roquefort or other smelly cheese packed in the tiny hole on the trigger will fetch them every time.

For rats one of the best poisons is barium carbonate. Mix with 4 parts meal or flour and 1 part of the mineral, or ordinary oat meal ⅞ and barium carbonate ⅛. Place a bit in rat's runway, a small teaspoon at each place. Strychnine is effective but so swift in action that the rats may die in their holes. If used insert in pieces of raw meat and protect from domestic animals. In any ordinary quantities barium carbonate is not injurious to the larger animals.

Bedbugs

Of course we have no bedbugs in California. Occasionally, however, a traveler comes in over the overland and visits for a short time. Boiling water or corrosive sublimate will search out these pests in the tiniest cracks. The corrosive sublimate should be dissolved in alcohol. Fresh buhach powdered into cracks is also effective.

Where they have become settled in cracks in woodwork, etc., the only effective method of disposing of them is fumigation with hydrocyanic acid gas. If possible have this done by a professional for the gas has sometimes proved deadly to the human if breathed in any quantity. If the gas is made in the room use 1 ounce sodium cyanide, 1½ fluid ounces sulphuric acid, 2 ounces water for every 100 cubic feet of space in the house or room to be treated.

Silver Fish

Pyrethrum, or buhach, scattered back of the bookshelves will prevent this pest from destroying paper, especially where paper is glazed, or if the pest has already made its appearance, spray the shelf back of the books with sodium fluoride. A good poison is starch paste in which arsenic is mixed. Spread this paste on cardboard and leave where the pests appear. Perfect cleanliness and frequent airing are distasteful to these pests.

TO CLEAN WINDOW SHADES

Apply thick soap suds to the shade with a sponge wrung almost dry so as not to water-soak the shade and rub briskly. The best way of accomplishing this is to stretch out the shade on a flat surface. If the shade will not wash well, apply Fuller's earth or cornmeal with a stiff brush. Old shades may be made over by painting any desired color; the paint improves the appearance and gives them body. Use but a thin coating of paint and have it perfectly dry before rehanging.

TO WASH CORDUROY

Do not rub or wring as either will flatten the pile. Wash in warm suds, rubbing soiled spots, if necessary, very lightly in the hands. If possible clean by letting stand in the water and sousing up and down in suds. Rinse in several waters and hang dripping on the line. Hang perfectly straight as of course you will not iron the material. When dry brush up the pile with stiff brush.

TO PROLONG LIFE OF LINOLEUM

A thin coat of varnish applied to the linoleum will lengthen its life. It may be applied when new, or when the linoleum begins to show signs of wear a light varnishing will brighten its appearance and add to its wearing qualities.

APPLE KETCHUP

Quarter, pare, and core 12 sour apples. Put in a saucepan, cover with water, and let simmer until soft; nearly all of the water should be evaporated; rub through a sieve and add the following to each quart of pulp: One cup of sugar, one teaspoon of cloves, one teaspoon of mustard, two teaspoons of cinnamon, and add one tablespoon of salt, two cups of vinegar, and two grated onions. Bring the ketchup to a boil, and let simmer gently for one hour. Bottle, cork and seal.

COULDN'T BE OTHERWISE

"Are you of the opinion, James," asked a slim-looking man of his companion, "that Dr. Smith's medicine does any good?"

"Not unless you follow the directions?"

"What are the directions?"

"Keep the bottle tightly corked."

NOT FAMILIAR

"What kind of a looking person is your hired man, Ezra?"

"I s'pose you'd call him an open-faced feller," replied Farmer Hornbeak. "He yawns so much that once when I met him with his mouth closed I didn't know him."

HOUSEHOLD THRIFT

A daily and weekly plan for housework, reducing the hours of working day where feasible as has been done in industry; saving time by simple living, by convenient work rooms, by efficient utensils and working equipment, by sharing work between members of family.

HIS APPETITE

She: "That new hired man has an appetite like an elephant?"

Farmer: "Yes, he tries that hard to get out of doing work that it makes him just ravenous when he sits down at the table."

Stained zinc is hard to clean. Try this: Rub hard with whiting moistened with kerosene or hot vinegar Wash in hot soapsuds. Wipe dry.

PREMO
Film Packs
Developed

An entire pack, 12 exposures, size 2¼x3¼, 25c; 2½x4¼, 30c; 4x5, 35c. Let our careful, experienced workmen develop your next Film Pack. We also make Velox prints, of course.

When You Buy a Piano It Pays to Buy a Good One

When you buy a piano you intend it to last a lifetime. Therefore special care should be used in making a selection.

You should not be guided by cheap prices or special inducements. Pianos, like everything else, are priced according to their intrinsic worth. If you do not possess expert knowledge of piano making you must rely greatly on the Piano Dealer. Take greater care in selecting the Dealer then the Piano. It is certainly to your interest to go to a dealer who has the reputation of carrying only pianos of merit and true musical worth, who is known to price his pianos consistently and who has only one price for everybody.

We carry a number of well known makes, each the very best in their grade. Prices of new pianos range from $400 upward; good "used" pianos from $200 upward. If desired, we arrange convenient terms of payment.

We invite you to call at any of our stores—or write us asking for illustrated catalogs and prices.

We are dealers in Steinway and other Pianos, Pianola and Duo Art Pianos, Aeolian Player Pianos, Player Rolls, etc.

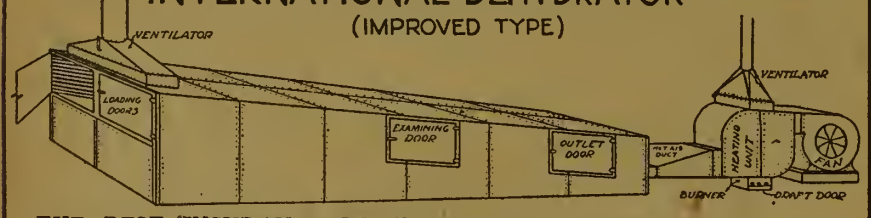
INTERNATIONAL DEHYDRATOR 5 TON UNIT
(IMPROVED TYPE)



THE BEST INSURANCE IN THE WORLD AGAINST CROP LOSS
Grapes, Prunes, Peaches and Vegetables
Tons Will Be Saved This Year by the
International Dehydration Machine
Every FRUIT and VEGETABLE GROWER and all CANNERIES should use this approved method without delay. The establishment of an International Dehydrator in any community is a mark of progressive distinction. "Fifty-four per cent. (U. S. Government Report) of vegetables and fruits that come to maturity are lost."
This machine is not a "toy" nor a "hot box." It is a real commercial proposition. We completely guarantee the perfectness of our equipment.

HAY

Under date of August 2, Scott, Magner & Miller says:
Receipts past week 2655 tons. Owing to shortage of cars shippers have been compelled to accept gondoias which are both expensive to load and unload. Some stock cars are being furnished at some points. Demand has been good throughout the week and most of the receipts have been moved without difficulty. The majority of receipts by rail have been of alfalfa and wheat hay, most of the red oat hay having arrived by boats from the reclaimed districts. Aifalfa has been in demand and is the leader in the market at present. No demand for straw.
We quote today wholesale prices in carload iots for old hay as appear from dealers' transfers upon the hay market—for prices to consumers charges of cartage, commission and handling expenses must be added according to conditions:

Fancy Wheat hay (light 5-wire bales) per ton	17.50@18.00
No. 1 Wheat or Wheat and Oat hay	15.00@17.00
No. 2 Wheat or Wheat and Oat hay	12.00@14.00
Choice Tame Oat hay	15.00@17.00
Other Tame Oat hay	12.00@14.00
Wild Oat hay	10.00@13.00
Barley hay	12.00@15.00
Alfaifa hay	17.00@21.00
Stock hay	9.00@11.00
No. 1 Barley straw, bale	.50@ .80

Citrus Markets

Los Angeles, August 6, 1919.

A iot of side tracked stuff has been cleaned up and Eastern auctions are showing long prices again. Another factor affecting the market is that the Southern shipments of peaches and meions are declining somewhat.
Lemons fair but nothing spectacuiar.

Shipments

Shipments of citrus fruits to date since November 1, 1918: Southern California; oranges, 29,423 cars, lemons, 8440, total 37,863. To same date iast season; oranges, 12,681, lemons 4672, totai 17,353. Central California this season; oranges, 4427, iemons 354, total 4781. To same date last season; oranges, 2539, lemons 115, totai 2654. Northern California; oranges, 244, lemons 2, total 246. Last year same date; oranges, 203.

MARKET NOTES

The acreage of tomatoes for canning is estimated at 2500 in Sacramento and Yolo Counties, with prospects for a much larger tonnage than last year.
Indications are that there will be an increased acreage of fall lettuce for shipment in the Sacramento district this year.
Onion seed crops were injured again this year in the districts trlbutary to Sacramento and Stockton by hot winds. The damage is spotted, varying from 2 to 50 per cent. Preliminary estimates of loss from all fields indicate about 25 per cent injury. The acreage will probably be much reduced next season as prices to growers will be cut.
Last year California and Arizona together produced about one-half the cantaloupe crop of the country.
Up to July 1 California had shipped 8640 cars of cantaloupes; 7390 cars were from the Imperial Valley. The heavy shipments from the central district are of course later.
The late crop of Australian Brown onions is now ready for shipment.
Contracts for future delivery in Wenatchee Valley, Washington, range for orchard run summer varieties, $2.00@$2.50 per box; Winesaps, $2.00@$2.25.

NOTES ON BUTTE CITY SALE

Continued from Page 155

and the price paid ruled strong. A number of small farm flocks were started. Ranchers are beginning to learn the value of a few sheep about their places. They keep the corners and ditch banks clean.

CALIFORNIA CATTLEMEN

The California Cattlemen's Association is the latest organization out with a house organ. It is now publishing the California Cattleman, Vol. I, No. 1 just being received. "It is the sincere hope of the directors and the editor that this journal will promate an interchange of ideas and that the cattlemen will look upon it as their very own."

DAIRYMEN'S DAY

The Los Angeles County farm bureau is moving to secure observation of Dairymen's Day, to be held under the auspices of the bureau some time during the live stock show in Los Angeles, October 18-26. While the plans are being worked out by the Los Angeles County people it is hoped that it will be observed by dairymen over all portions of the Southern part of the state.

SAN FRANCISCO SHOW UNDER WAY

At a meeting of the board of directors of the California International Live Stock Show Corporation, San Francisco, August 4, vacancies in the board of directors were filled by the election to membership of J. H. Rossiter, T. W. Dibblee and F. J. Koster. Rossiter succeeds Edgar J. De Pue, deceased; Dibblee succeeds Vanderlyne Stowe, deceased, and Koster succeeds Gordon H. True who resigned from the directorate upon his election as secretary of the corporation and manager of the show. The board declined to accept the resignation of Fred W. Kiesel which had been presented.
Preliminary work for the show is well under way. There will be a liberal increase in premiums over last year and the amount of special prize money offered by the national breed associations has been very materially increased. Work on the premium list is being rushed and it will be ready for distribution in a few days.

MAN'S SPHERE

"Where," asked the female-suffrage orator, "would man be today were it not for woman?"
She paused a moment and looked round the hall.
"I repeat," she said, "where would man be today if not for woman?"
"He'd be in the Garden of Eden eating strawberries," answered a voice from the gallery.—Tit-Bits.

AN ACUTE ATTACK

"Weren't you shy when the judge asked you your age in court?"
"Yes, I was about ten years shy, my dear."—Life.

NOT BY THE HOUR

"Do you understand the new telephone rates?"
"No. Can you explain them?"
"I think so. Of course you know we are to have metered service."
"Yes, I saw that in the paper."
"That means we will be charged for every call."
"Each call will be a distinct charge, then?"
"Yes."
"I'm glad of that. I had an idea when they put a meter on the line they were going to charge us by the hour, and judging from the time it takes me to get a number now that would bankrupt me."—Detroit Free Press.

If you would convince others that you are a fool, boast of your wisdom.

A pessimist thinks it's an ill wind that blows anybody good but himself.

Some men claim to practice what they preach merely as an excuse for preaching.

WEATHER REPORT

Wade Improved Pea and Bean Thresher

The luxuriant growth and tough vines of Western grown peas and beans require a stronger draft than has been possible heretofore. Improved and stronger construction of the WADE Blower results in a more powerful current. The larger-than-ordinary cleaning surface assures greater output, and our sacking attachment completes the machine.

Wade Controlled Air Currents

The air currents are not allowed to blow broadcast through the machine. They are controlled by our improved damper and concentrated through our own construction to do the work better and more efficiently.

Learn All About the WADE

The construction throughout will please you; it has that "stronger than necessary" appearance that means service. Post yourself on this wonderful machine; send at once for our booklet, fuliy illustrated, comparing the WADE features with the old style. Prices no higher than on ordinary machines. You be the judge. Write today.

Cletrac

TANK-TYPE TRACTOR

(Formerly known as the "Cleveland" Tractor)

ROLLIN H. WHITE, the well-known automotive engineer, designed the Cletrac Tank-Type Tractor to do most of the work formerly done by horses and mules—to do it *better, quicker, cheaper*—and to do it *twelve months in the year.*

A million American farmers can profitably use such a tractor.

It does far *more* than merely plow. That is *only the beginning of its usefulness.* It goes right through with the *entire preparation of the seed bed*—from plowing to seeding. And in addition it reaps, binds, threshes, hauls, cuts ensilage, fills silos, saws wood, digs potatoes and does many of the numerous other chores always necessary about the farm.

The Cletrac stands on two long "feet" each 50 inches long by 6 inches wide. And because of this immense "foot" surface it is kept on top of the soil by the same principle that enables a man to walk on snow shoes. This distinctive construction enables the Cletrac to work *efficiently* on wet or sandy soil. It permits it to go over the seed bed without sinking in—and without leaving two tracks of packed down soil behind it. The same principle that made the "tanks" so successful in the mud of Flanders gives the Cletrac the ability to work practically *anywhere.*

The Cletrac is only 96 inches long, 52 inches high and 50 inches wide—enabling it to work up close to trees and fences and making it ideal for orchard use.

But in spite of its small size and compact construction the Cletrac is extremely powerful and will do the work of six horses or mules—and has a speed of from forty to fifty per cent *greater* than the average tractor. And it will work on side hills and grades where most tractors fail.

The Cletrac operates on gasoline, distillate or kerosene, but is specially designed to use kerosene or distillate.

Service is a vital thing to consider in the purchase of a tractor. If small replacements or repairs are needed you usually need them in a hurry—and you'll find *every Cletrac dealer well equipped to give you prompt, efficient service.* Back of the dealer stands The Cleveland Tractor Company—big, substantial, and permanent—assuring you that your interests will always be taken care of no matter in what part of the country you are located.

In spite of steadily increasing production facilities we are having difficulty in keeping pace with orders. Early ordering is therefore important. Such tremendous possibilities are open to Cletrac owners for making greater profits because of *larger* and *better* crops—because of the ability to *work the soil at any time desired,* in spite of horse-killing heat—because of the *year round utility* of the Cletrac, that you are losing money every day you are without a Cletrac.

We have an interesting and instructive thirty-two page book entitled "Selecting Your Tractor" that will be sent free upon request. It goes into *your* problems *—and solves them.* Send for it today.

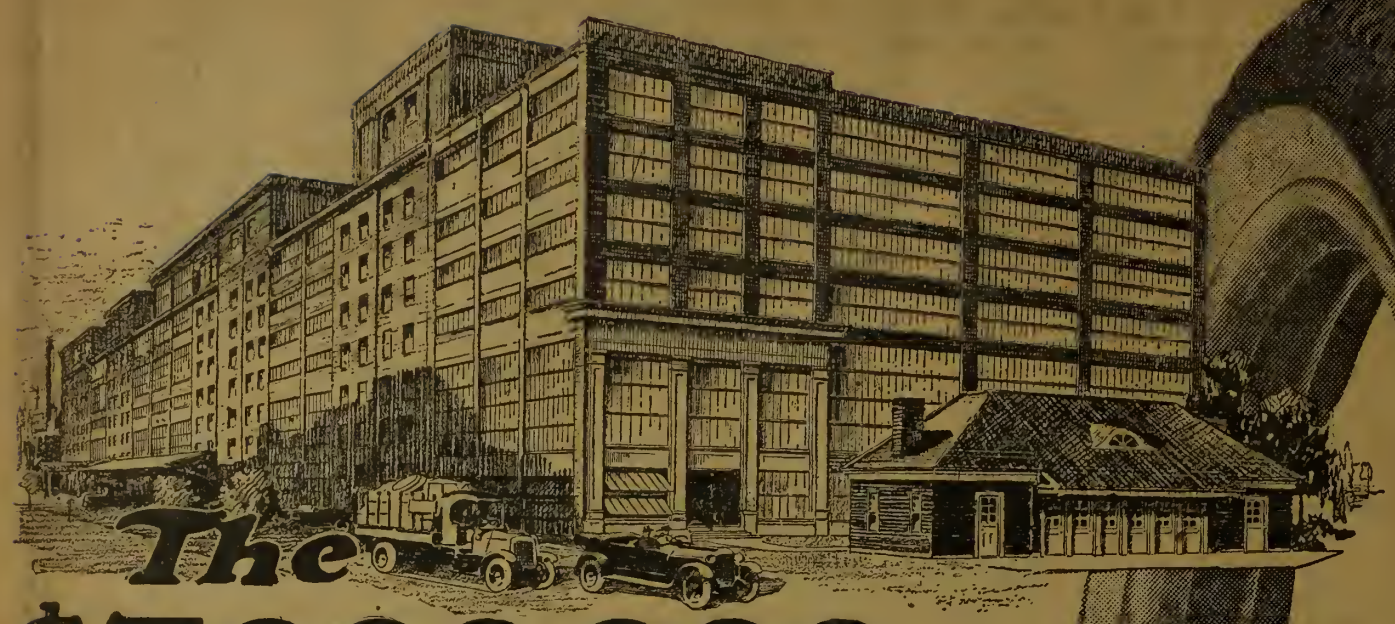
Comin' Through the Barley



The $7,000,000 3½ Inch Tire

—or it might be called the $73,000,000 tire, for it is possible only because of the entire resources of the Firestone Company.

BUT $7,000,000 is what has gone directly into this new, vast Firestone factory that is devoted exclusively to the making of this tire and the tubes to match. The main plant is now concentrating on Cords and big sizes.

16,000 3½-INCH TIRES 20,000 3½-inch tubes is the daily capacity of this new factory. This plant is years in advance in its mechanical efficiency. Into it has gone the thinking, planning, the spirit of service that distinguishes the entire Firestone organization. Its methods and machinery were developed by Firestone men.

FIRESTONE HAS STEPPED FAR AHEAD in engineering practice and you get the benefit. The labor saving equipment of this factory cuts costs on every operation from 10% to 30%.

FROM THE TIME special shipments of rubber and of fabric arrive at this plant, until the finished tire is loaded on the freight car, there is not a backward move.

AND THE MAN POWER of this plant is as far in advance of the ordinary as is the mechanical efficiency. Firestone organization is the talk of men in big industry everywhere.

THE FACT THAT 90% of Firestone workers own stock in the Company is an index to their interest in their work. Their superior skill, their spirit of service, is stimulated by their financial interest in winning you as a customer.

AT EVERY TURN Firestone thinks and plans to give you the most for your money, knowing that this is the surest method of obtaining the greatest demand. Every move Firestone makes is toward this end—mileage at lowest cost.

NEVER HAS FIRESTONE, NOR ANY TIRE MAKER, offered car owners so much as they are offered now. It is the year of big value. Ask your dealer.

The Orange Supply

By F. O. Wallschlaeger, at Citrus Institute, San Bernardino, February 21

The facts given in Mr. Walischlaeger's address which was made at the San Bernardino Citrus Institute are only up to the end of the year 1918. Any new facts that might be secured for the first six months of 1919 will probably make little difference in comparisons one country with another.

THE three largest citrus fruit producing countries are the United States, Spain and Italy. In 1916-17 the United States produced in the neighborhood of 75,000 to 80.000 carloads. On account of war conditions the Spanish and Italian industries have been in an unsettled condition and the data from those countries are not in very satisfactory shape. Under normal conditions Spain produced about 68,000 carloads and Italy about 58,000 carloads.

The data on production in Louisiana, Mississippi and Texas is not available. Considering California, Florida and Porto Rico, a four year average shows that California shipped about 80 per cent of the total United States supply of oranges and grapefruit, Florida 36 per cent, and Porto Rico 3.6 per cent. I include the grapefruit with the oranges, as to a certain extent oranges and grapefruit are interchangeable as a breakfast fruit. If we consider oranges only, we find that in 1916-17 California shipped 72.4 per cent, Florida 24.8 per cent, Porto Rico two per cent and the imports only amounted to 8/10 of one per cent in that year.

In the past the imports of oranges have been greater than at present. The largest imports of which we have any record were in 1884 and were valued at $2,901,000. When we consider that California oranges alone now have a total annual value of between $35,000,000 and $40,000,000, it will be apparent that the imports even at their largest represented but a small fraction of the total value of oranges used in the United States at the present time.

UNITED STATES ORANGE AND GRAPEFRUIT SUPPLY
1914-15 to 1917-18

Year ending October 31:	1914-15 Cars	1915-16 Cars	1916-17 Cars	1917-18 Cars
California—Southern	33,317	31,871	40,702	14,346
California—Northern and Central	6,421	6,026	5,889	2,773
California—Total	39,738	37,897	46,591	17,119
Florida—Oranges	.....	18,073	15,989	8,880
Florida—Grapefruit	.....	5,994	4,824	5,434
Florida—Total	24,997	24,067	20,813	14,314
Porto Rico—Oranges	619	1,167	1,262	1.391
Porto Rico—Grapefruit	714	886	1,113	1,339
Porto Rico—Total	1,333	2,053	2,375	2,730
Grand Total	66,068	64,017	69,779	34,163
Imports—Year ending September 30	143	191	497	.....

Imports

The table giving the supply of oranges and grapefruit in the United States during the last four seasons shows that so far as competition from foreign countries is concerned, there is very little. Our largest imports were in 1917 and amounted to the equivalent of about 500 cars. The largest imports of oranges came from Spain, due to the shutting off of her normal markets and her endeavor to secure compensating markets. During the year ending June 30, 1917 there were imported $102,000 worth of oranges from Spain. Japan was the next largest source of our imports with $33,000. The British West Indies, principally Jamaica, exported about $9000 worth to this country, and Costa Rica and Cuba each between $5000 and $6000; the total imports in that year being valued at $160,110.

Of the oranges that are shipped into the United States, Porto Rico ships the largest quantity. The amount of oranges shipped from Porto Rico to the United States in the year ending October 31, 1915, was 619 cars; the year ending October 31, 1918, shows 1391 cars or 108½ per cent increase. This fruit enters the United States duty free. Three-fourths of the oranges from Porto Rico are classed as "wild" fruit. It is probable that the shipments of citrus fruit to this country from Porto Rico will continue to increase.

Spanish oranges in 1916-17 were brought to this country in larger quantities due to war conditions. The American consul at Valencia, Spain, under date of August 16, 1917, writes regarding the exports of oranges to the United States as follows: "Exports to the United States fell from 64,720 cases in 1916-17 to practically none this season. The results of shipments made to that country last year in an effort to find compensation for the impairment of the British market were altogether unsatisfactory to shippers, who were forced to conclude that the Valencia orange can not compete in American markets with the California and Florida oranges. So long as European markets were available it was neither necessary, nor profitable for Valencia oranges to seek an American outlet."

It is apparent also that even in Canada, where only a small ad valorem duty of seven and one-half per cent is collected as war revenue, the Spanish orange has been losing grounds, its place being taken by California and Florida oranges.

The Japanese oranges brought into this country are practically all of the Mandarin variety, although Japan produces some Navel oranges. The principal countries to which Japanese Mandarin oranges were shipped in 1916 are: Kwantug $216,921, Canada $113,274, Asiatic Russia $108,831, China $88,921, and the United States $50,875. Japan is actively going ahead with citrus culture, the government having at one time subsidized plantings and later turned to the distribution of trees, in order to assist the development of this industry.

The British West Indies, principally Jamaica, come next to Japan in the value of oranges imported into this country. With favorable conditions, it is to be expected that Jamaica could largely increase her exports to the United States. Canada has been receiving a very much larger amount than the United States, and even the United Kingdom has received a larger quantity. In the first six months of 1917 the destinations of Jamaica oranges were: United Kingdom, 71,100 of fruits; United States, 6750; Canada, 829,500; other countries, 439,000; total, 1,346,350.

After the Messina earthquake Jamaica turned to the production of orange oil, and the exports to the United States increased in value from $1759 in 1911 to $119,636 in 1916. It is estimated that the quantity of oranges required to produce the 2424 packages of oil exported in 1916, would equal 1000 carloads of California size.

The Cuban orange exports have been rather at a standstill, grapefruit being of more importance.

Mexico formerly exported oranges to the United States, but, on account of the prevalence of a fruit fly there, the federal horticultural board prohibited the importation of oranges into this country. They are permitted to export this fruit to Canada, it being shipped through this country in bond.

There are two countries that are establishing a citrus industry and have looked longingly for exterior markets. They are New South Wales and South Africa. Prior to the war these countries felt that having an opposite climate, there would be an opening in other countries during their season of scant supply. It was estimated in 1915, by the British government trades commissioner, that there would be 400,000 boxes of citrus fruits available for shipment from South Africa to England during the coming season, and that in ten years there would be 4,000,000 boxes annually available. He also stated that within the next few years California would be outrivaled, and that great fortunes would be made in orange growing. Later information indicates that probably due to war conditions, the citrus fruit producers were contemplating the establishment of a citric acid factory and also a jam factory.

In 1913-1914, the Australian commonwealth produced 1,341,878 bushels of oranges and 297,083 bushels of lemons. A trial shipment of oranges and lemons was made by the New South Wales Department of Agriculture to Canada. The price realized was satisfactory, but no further material shipments have appeared. In 1913, the principal source of Australia's imports of citrus fruit was Italy, with Egypt, Asia Minor and the United States following in the order named. The total imports of that year were valued at $214,305, as compared with the production of $2,892,000. It would seem as though Australia is able to take care of her home demand for citrus fruits, except during her season of scant production.

In the case of New Zealand, the production of oranges and lemons has not been as successful as Australia. New Zealand obtained her oranges in the year 1917 from Australia, the United States and the Society Islands in the order named.

Exports

The exports of oranges from the United States have been increasing from year to year. However, Canada, the principal country to which we export took 93 per cent of the total exports in 1917, 96 per cent in 1918, and the four previous years took approximately 95 per cent. Other countries to which we export are New Zealand, Mexico, Australia and the United Kingdom. The United Kingdom formerly was our next largest customer. In 1915, we exported 35,748 boxes to the United Kingdom, but this decreased to 3181 boxes in 1918, on account of shipping conditions. There is now being shipped some fruit to England, and the shipping board has recently announced a freight rate of $1.00 per box. Though we shipped some oranges as far as China the geographically nearer markets in South America do not take any considerable amount of fruit, Chile taking the largest quantity in 1917, only amounting to 338 boxes. We do export some oranges to Panama, Cuba, Japan, Philippine Islands, Alaska and Hawaii. The best opportunities for increasing our sales of oranges abroad seem to have been in Australia and New Zealand.

THREE TIMES AS MUCH WHEAT AS LAST YEAR

Commercial stocks of wheat reported in a survey made by the department of agriculture for June 1, 1919, amounted to 51,392,898 bushels. This represents nearly three times the stocks held by the same firms on June 1, 1918, the actual percentage being 274.5 per cent of the 1918 stocks. The figures refer to stocks actually reported by 8684 firms and do not represent the total commercial stocks of the country nor do they include stocks on farms.

Other Cereals, Flour and Corn Meal

The commercial stocks of other cereals reported for June 1, 1919, according to the department's statement, were as follows: Corn, 17,254,576 bushels; oats, 45,770,543 bushels; barley, 20,043,375 bushels; rye, 14,624.331 bushels. These stocks represent the following percentages of the corresponding stocks on June 1, 1918: Corn, 47.6 per cent; oats, 90.6 per cent; barley, 207.2 per cent; rye, 346.1 per cent.

VALUABLE SMALL POWER

Potato diggers of the elevating type are now equipped with light weight engines of sufficient power to operate the elevator in the heaviest soils. While increasing the working capacity of the digger it also adds life to it by reducing the number of horses required and taking the greater strain. The engine is used similiarly on grain, rice, and corn binders, headers, manure-spreaders, mowers and reapers. In fact, as its adaptability becomes better known and appreciated it may be used on much of the farm machinery that is now operated solely by the tractive power when the implement is drawn by horses or tractor.

OUR ADVERTISERS RELIABLE

We guarantee our subscribers against loss through dishonesty of any advertisers in the Cultivator. We do not attempt, however, to adjust trifling differences between subscribers and honest, responsible advertisers, nor will we pay the debts of honest bankrupts. Notice of complaint must be sent us within 30 days from date of the transaction, and the subscriber must have mentioned the Cultivator when writing the advertiser.

THIS WEEK'S COVER

In view of the present high cost of labor the department of agriculture is urging more attention to hogging off, in fact, general "livestocking" off and saving harvesting expense. With California irrigation methods corn is a much too high priced product to harvest in a way which does not conserve every kernel, but hogging off of barley has been practiced in this state to a limited extent, and it is probably worthy of more attention than it has ever had. There is also at this time a general seeking for sorghums and millets or other grains which can be satisfactorily pastured off, both as to grain and as to roughage. "The richest country is the grass country," and while California has little of established pasture lands with heavy sward, yet pasturage does afford great increase in California's wealth, and a better understanding of our annuals and perennials which are adapted to California conditions will increase our wealth.

HONORING ROOSEVELT

The Roosevelt Memorial Association recently organized is sending out its first information as to two memorials to Roosevelt. One of these is to be a great shaft or dome or other structure in the city of Washington; the other, a memorial park on Sagamore Hill. The association plans for the raising of a $10,000,000 fund to give proper expression to the admiration of the American people for the Great American.

ALMONDS

From the Antelope Valley in Los Angeles County to the northernmost almond producing section of California the trees are loaded, possibly not in every orchard, but as a rule. Some orchards are bristling with props, and still the trees are breaking. Even in the Antelope Valley neglected trees which have not yet died from drouth or other things are loaded, and if there is sufficient moisture in the ground to fill the nuts there is no reason why that section will not produce an immense crop. The United States is still importing vast quantities of almonds. California has an acreage of some 50,000, with only some 5000 to 6000 tons for normal production, but California growers are rising to the opportunity and growing more almonds.

THOUGHT FOOD

The packers are somewhat disturbed for fear the Kenyon bill now before congress will become a law and are using a lot of energy to convince the public that they, the packers, are selling meat at very small turnover on a dollar. In a Los Angeles paper, Sunday, August 3, there appeared a list giving the price of imported food on July 15 in Germany and the price in Los Angeles as follows:

	Germany	Los Angeles
Flour	.06c	.09c
Rice	.21c	.15c
Beans, peas	.12c	.10c
Bacon	.40c	.60c
Lard	.54c	.35c
Potatoes, new	.02c	.04c

The staple articles of flour and bacon are shipped to Germany and sold a great deal cheaper than in this country. Perhaps the packer is right in his contention, but it will take a lot of propaganda to convince the returned soldier and his family that sacrificed so much that he should pay 50 per cent more for food than Germany is paying.

MORE GOATS

The goat seems to be taking possession of the small farm in California. The southern end of the state especially claims to be the "goat center" of the world, this not excepting the mountain sides of Switzerland or the Island of Malta, and there are being developed some exceptionally fine animals. Two associations have been formed in the southern end of the state; now comes another in the central or northern part which was organized at Berkeley last week. The goat will never replace "Old Bossy," but it has a secure place all its own.

NOT GUILTY

Some time ago we referred to the fact that a number of members of the Associated Milk Producers operating in and around San Francisco had been indicted on a charge of violating the Cartwright law by a conspiracy against trade. The indictment followed the alleged expose of the methods of the association staged by a San Francisco daily paper that sought to ingratiate itself with the public by appearing as the champion of the babies. Those who followed the San Francisco "fight" thought they detected here and there signs that seemed to indicate that the line of attack was the same as had been often employed in similar fights in other cities. The trial came to a close last Thursday when the jury brought in a verdict of "not guilty."

Another victory has been won by the milk producers, but they should not imagine that the battle is over. Unless we miss our guess there will be other skirmishes from time to time. The same tactics will be used, the same ammunition fired—but the result will never be in doubt. The wonder of it all is that editors and prosecutors continue to "fall for such old stuff."

DAYLIGHT SAVING

The Eastern farmers are continuing their effort to have the "daylight wasting" law repealed and have secured the passage of a bill which is now before the president. The president's veto of the former bill in which expressions were used indicating that the opposition to the original daylight saving bill had been of little force, was sufficient to stir up several hornets nests, and those who disapprove of the daylight saving scheme got busy as they never had before. Those who are opposing this summer change of time assert they will never let up until this law is repealed.

POTASH

A great number of farmers east of the Rockies are insisting upon the admission of German potash. The West as a rule is opposing it. Unfortunately soil conditions in much of the East require potash to produce profitable crops. On the Pacific Coast the demand is less and the supply is nearer at hand. This supply was greatly increased during the war by the development of natural potash beds in California, Nebraska and other sections; also by large production of potash from kelps. This was made necessary because of the embargo and the demands of war. Notwithstanding this the industry was not put upon its feet so as to compete with German produced salts which can be brought from Germany at much below American prices of manufacture.

It's the old question of tariff or free trade. The Eastern believer in protection for the great steel industry transforms into the free trader when it comes to protection of potash he may wish to purchase for Eastern farming operations.

SHADE IN SCHOOL YARDS

The Easterner automobiling in California usually remarks on the architectural beauty of California school houses, and when we remember the little old red school house on the bleak wind-swept knoll back in the states, without a tree or other green growth, that is, not counting the spare acre of mayweeds, the beauty of the usual California school building and grounds appears. But there are cases which are different.

A drive through the valley brings to view some of these old time school house types—hardly shade enough for a horned toad, yet the Australian eucalyptus in five years makes a wonderful shade. Why does not the board of trustees of the old country school "deestrict" observe Arbor Day, plant a tree and plant some posts by it to give it protection for a few years and secure for the youngsters of the future as much happiness as we youngsters had in the old Buckeye State when we took our little tin buckets a quarter of a mile to the old chestnut tree to eat in its grateful shade?

Speaking on this subject some time ago John Vallance said:

"Picture in your mind one of those unsightly buidings standing in a hot valley, the sun pouring into the windows at all times of the day, with not a particle of shade! Do you think those children can concentrate their thoughts upon their studies under such conditions? Do you think we are going to get the best out of them? Do you think it is right to subject them to such a condition of affairs through our neglect? Do you think the children will have happy recollections of their school days under such conditions?"

H. C. OF L.

We recently saw an illustration of '49er days in California, a street in Hangtown or some other mining camp, with restaurant in the foreground announcing "Ham and Eggs, $5.00," "Bread and Tea, $2.00," while across the street overalls were listed at $52. We seem to be approaching the old days with modern day prices. As one writer has expressed it, it is a case of the dog chasing its own tail, for it's only a few months since the railway people demanded a raise in wages, and because of this increase in transportation costs, all products going to market had to raise to meet the increase in the other costs. Now to meet that increase the railway people are demanding another raise in wages, and the everlasting chase about the circle is keeping up.

Congress is making a bluff at reduction, in fact, it seems to be quite in earnest, but with the desire to down Bolshevism by keeping the laboring people in the best of humor, it is presumed that wages will continue upward. There is only one possible result, that is, that other commodities continue in the same direction. Fortunately the effort to lay the entire blame at the door of the farmer is not always succeeding, for labor is now taking its portion of the blame.

Volney Craig, president of the Los Angeles County farm bureau, calls attention to some of the pertinent facts in this discussion. He makes reference to the fact that one of the war measures, that encouraging manufacturing, especially ship building, guaranteed all costs and a profit of ten per cent, and that such guarantee was never given to the farmer. The wheat growers' experience was cited by Mr. Craig. But there was one point he did not make, and that is that when the arbitrary price on wheat was first made it was then commanding on the market $3.50 per bushel and effort was made by the food administration to cut this to $1.50. It was realized that this would cause rebellion, and the $2.20 price was finally fixed. This took millions of dollars from the wheat growers; it gave cheaper bread and the farmers paid for it, but such proof of patriotism was never required of the manufacturing or other interests.

Let us have greater purchasing power given to our dollar; at the same time it is not fair nor just to charge its depreciation to farming interests

A firm of wool growers of Yakima, Washington, expresses satisfaction with the plan tried out of shipping wool to market on the sheep's back. Wool and mutton both were marketed in Chicago. The animals were held two months at Trevor, Wisconsin, for shearing and fattening. They beat the home price a little on both wool and mutton.

Oranges or Walnuts

By H. H. Warner

THE successful fruit grower is a prophet. When he sets out his orchard he needs to know where the outlet will be for his fruit when his trees come into bearing six, eight or ten years hence. He needs to look a long way ahead as his is not a crop which can be changed from year to year to suit the varying market conditions.

Great stretches of land in Southern California, thousands of acres of fertile soil, are equally well adapted for the production of either citrus or deciduous fruits, and the rancher in deciding to set out an orchard is confronted with a bewildering array of possibilities from which to choose. His land may very likely be able to produce apples, apricots, peaches, pears, prunes or walnuts, not to mention a large variety of vegetables which he may elect to grow between his young trees. He needs to choose very wisely and he should have some definite knowledge of the possible future returns before settling down to the long nothing-coming-in-and-everything-going-out period until his trees begin to bear.

Naturally under conditions of this kind many mistakes of judgment have been made. In a large number of cases too much emphasis has been laid on the productivity of the soil without due regard to the possible marketing outlet.

In Southern California the two fruit crops which have stood the test of both production and marketing experiences are oranges and walnuts. This does not indicate that other fruits could not be successfully grown on much of this same land, but there are not yet available to the producers of these other lines the great cooperative marketing organizations which have made the growing of oranges and walnuts so profitable.

So in the end the marketing possibility, not the producing capacity of the land, has been the determining factor. The grower may personally feel that there will be a strong demand for avocados, or the so-called "alligator pears," when his trees will come into bearing, but he hesitates to plant avocados because there is no growers enterprise which can assure him that his production will be handled with a profit to him. A single rancher attempting to market his own output in a fresh condition 3000 miles away has quite a job on his hands. And right here it should be noted that the production of fresh fruits and vegetables for the local coast markets is already being overdone.

During the last 15 years the increase in the area of citrus fruit plantings in the coastal and interior valleys of Southern California has been in two opposite directions, higher up on the slopes of the foothills and lower down on the floor of the valleys. A better understanding of methods of hillside cultivation and irrigation, coupled with the constant effort to eliminate the danger from frost, has given a distinct impetus to the expansion of orange and lemon orchards toward higher elevations.

In the direction of the lower lying lands the expansion has progressed more slowly owing to the increasing danger from frost. Nevertheless a great movement has taken place in this direction as the soil of these valley floors has been found to produce large crops of superior quality.

In Los Angeles and Orange Counties particularly these lower lands were originally pretty generally set out to walnut trees. One of the most interesting transformations in the history of the fruit business has been the graduai changing over of these walnut orchards to orange groves. As it became increasingly evident that the fear of frost in these lower lands was unfounded, the value of the lands suitable for citrus fruit planting naturally increased. With the price of walnuts five or six years ago netting the grower only 10 or 12 cents a pound he was unable in many instances to pay interest on the increased valuation of his land from the proceeds of his walnuts.

Consequently many growers began to do what George Washington did to the cherry tree, and hundreds of acres were grubbed out and reset to orange trees. In many cases if the walnut trees were not too large the oranges were interset and the walnut trees cut out after a couple of years as the orange trees began to grow.

This practice continued to be quite general until about three years ago when the war prevented the importation of walnuts from Southern France and Italy and caused a correspondingly higher price to be paid for domestic walnuts. Each year since then has witnessed fewer walnut trees being cut out. True, the price of oranges has increased somewhat during this same period in line with other food commodities, but since the war had no effect on the already negligible imports of citrus fruits, the price of walnuts was corresopndingly higher in proportion to pre-war figures.

Today the forces of the walnuts and oranges have signed an armistice. So far as the growers are now concerned it is about an even bet between oranges and walnuts on the lower lying lands of the great valleys in Southern California.

In the days when it was considered fashionable to remove old walnut trees and repiant with oranges, most of the ranchers pianned to take out only a few acres every year. A careful survey of the orchards in these districts today reveals small blocks of oranges and walnuts on almost every ranch, showing the progress of the work at about the time when walnuts began to compare favorably with oranges in returns.

The future of these two industries involves a number of factors which are weil known to the able managements of the two great growers organizations. From the marketing standpoint the great obstacle confronting the citrus fruit growers is the old one of overproductien. Just now this is being well taken care of through well directed national advertising primarily designed to teach the consumers how and why to eat more oranges. It appears now that with the aid of national prohibition that the consumption can be kept sufficiently ahead of the increasing production to warrant satisfactory returns to the growers for a number of years at least.

The production of walnuts has been greatly stimulated during the past three years by the higher returns which war conditions made possible. Thousands of acres of bare land have been set out to walnuts and the production of this crop will increase during the next few years as rapidiy as that of citrus fruits. The California Walnut Growers' Association conservatively estimates that the production will double about every six years and that the shipments in 1925 will approximate 50,000 tons or just double the probable production this fall.

Notwithstanding this fact the walnut grower is not worried about overproduction as only about half of the walnuts consumed in this country today under normal conditions are produced here. The chief concern of the walnut grower in trying to forecast marketing conditions is the probable extent of this importation from foreign countries. The tariff at present is two cents a pound on nuts in the shell but the grower does not feel that this affords the same amount of protection which a two cent tariff did before the war.

From the point of view of the production of the two crops there are admittedly fewer problems confronting the grower of walnuts than the grower of oranges. A walnut orchard is easier to care for and is subject to fewer diseases and losses from pests than is an orange orchard. In caring for a walnut orchard practically no money need be spent for fertilization, pruning, fumigating or frost fighting. It has now been demonstrated that the disease of die-back can be prevented through proper control of soil moisture; the damage done by aphis and the codlin worm can be held in check by dusting; and the propagation of new varieties which are practically blight resistant indicates that the most serious disease known as walnut blight may be overcome.

These are some of the considerations receiving the attention of forward looking growers today. The owner of one of the well known citrus fruit ranches, whose name has for years been prominently identified with the progressive development of the industry, is now searching for a large acreage suitable for the production of walnuts. Other growers, uncertain as to the future, are setting out both oranges and wainuts on the same land, pianning to remove whichever proves to be the least profitable when the trees come into bearing. We may safely conclude that in the future the returns to be made from either walnuts or oranges will be satisfactory and that the money to be made from a weil cared for walnut orchard has recently become and probably will continue to be comparable to the returns from a good orange grove.

The Maslin Seedling Fig Orchard

By G. P. Rixford

Owing to death of Mr. Maslin referred to on editorial page in recent issue of the Cultivator, the following article written by G. P. Rixford has particular interest. The Maslin orchard is a striking example of the persistence of some of our pioneer fruit growers. Mr. Rixford is connected with the bureau of plant industry of the department of agriculture and at the time of the planting of this orchard was with the San Francisco Bulletin which introduced some of the cuttings planted by Mr. Maslin.

THE Maslin seedling fig orchard planted by E. W. Maslin at Loomis, Placer County, in 1886 has played an important part in the development of the fig industry in California.

At the Fruit Growers' convention at Stockton in December 1910 reports were current that a number of fig growers in the San Joaquin Valley were digging up their bearing Smyrna trees in consequence of the difficulty of obtaining caprifigs containing blastophaga to pollinate their trees. The writer proceeded to Ceres, where most of the destruction of trees had occurred, and called a meeting of growers who could be quickly reached by telephone. There were present 12 or 13 growers who were admonished not to destroy any more trees as the United States department of agriculture had taken a lease on the Maslin orchard containing 72 capri trees and would furnish the entire crop to the growers at the bare cost of gathering and shipping the fruit, namely, 50 cents for boxes containing 160 to 175 figs. The growers next season availed themselves of the opportunity to the extent of over 600 boxes, 96,000 figs, with the result that no more fig trees were destroyed. In addition to devoting the entire resource of the Maslin orchard to the growers cuttings from the best trees were offered gratis to any one desiring to avail himself of the privilege. Besides several fine Smyrna varieties the orchard contained several of the finest caprifig trees in cultivation in the state.

Of the capri varieties several bear the largest figs ever seen in this country, with correspondingly large supplies of biastophaga from the ample gall zones and provided with large staminate clusters with abundance of pollen, besides vigor and hardiness that has never failed to carry the mamme crop safely through the hardest frost of California winters.

Many thousands of cuttings from these trees have been distributed throughout the fig regions of this and other states.

The significance of the Maslin orchard in the upbuilding of the Smyrna fig industry to its present healthy condition is also emphasized by the production of new varieties through breeding operations.

Some of the largest, handsomest and most lusciously flavored new varieties have been introduced into cultivation and will soon attract the attention of the lovers of the best fresh figs.

A fine black, or purple variety was produced by crossing the French variety called Agen with the Meyer Capri No. 2, by Prof. T. C. Mason, of the United States department of agriculture. It is round, or slightly pyriform, sweeter than the Mission and devoid of the rank flavor of that variety. The tree is vigorous, symmetrical, with a dense head. It is proposed to call it "McFadden" in honor of the man who raised it to a producing age.

Another notably fine colored seed-

Agricultural News Notes of the Pacific Coast

Northern California

Hayward, Alameda County, held its farm products show last week.

Colusa County contemplates returns of $15,000,000 from its rice crop.

Wheatland, Yuba County, made first shipment of hops from the state.

Colusa County is frightening ducks from the rice sections by airplane patrol.

The Nevada County farm bureau is holding fruit packing school at Grass Valley.

The Shasta County farm bureau is planning a fair at Anderson October 25, 1919.

Returned soldiers are taking the place of Hindu laborers in Glenn County rice fields.

The Sutter County farm bureau is planning a campaign to boost for the $810,000 bonds for good roads.

Sutter County will hold good roads bond election August 28. The amount of the issue will be $810,000.

Colusa grain growers recently sold 30,000 sacks of barley and report activity in the entire grain market.

The cattle protection board will inaugurate a cattle inspection and shipping depot in Mendocino County.

State employment bureaus have found places for 5909 workers, men and women, during the past year.

The Eden Township Farm Products Show to be held at Hayward, August 8, 9 and 10 will distribute over $1600 in cash prizes.

Yuba City is shipping 50 to 60 cars of fresh fruits daily during the height of the season. Shipments are about twice as heavy as last year.

Grain boats loading at Red Bluff in Tehama County are forced to materially cut their loads owing to the low water of the Sacramento.

Rice growers are being warned not to contract 1919 crop at present prices. It is predicted that an especially good market will prevail.

Sacramento Valley chamber of commerce is moving to preserve Lake Tahoe. There is an effort to take its waters into Nevada for irrigation.

Members of the Associated Milk Dealers of San Francisco have been acquitted of the charge of having violated the Cartwright anti-trust law.

Hops are now selling at 60 cents. Some growers who sold early will only get five cents as they sold on the supposition that prohibition would destroy values.

The work of the market division of the Glenn County farm bureau now requires the attention of three men. This division markets products for members of the bureau and buys supplies.

Rabbit producers in the Bay counties have practically completed arrangements for the formation of a cooperative marketing organization under drection of the state market director.

The packing plants of the Geyserville Cured Fruit Association and of the Santa Rosa Cured Fruit Association have been taken over by the Growers' Packing and Warehouse Company. The cooperative organizations operating these two plants have transferred practically all their membership to the Prune and Apricot Growers which expects to sign up 90 per cent of the growers in the county for the 1919 season.

Central California

The Valley Fruit Growers will open an office at Dinuba.

Grape shippers are threatened with shortage of refrigerator cars.

California wine grapes are going to be shipped East as jelly grapes.

Lodi, San Joaquin County, is building a plant for processing and packing almonds.

Santa Cruz County farm center meetings: Happy Valley, August 22; Soquel, 27.

Large shipments of green fruit, principally peaches and plums, are being made from Tulare.

Fresno County Poland-China breeders hold their first sale of pure breds Wednesday, August 20.

Pink root is the newest disease of onions to attack onion growing sections of San Joaquin County.

The San Joaquin County Poland-China Association will hold a sale of 40 pure bred boars and 20 sows at Lodi on September 19.

The olive crop in the San Joaquin Valley will be light this season, some orchards revealing not more than 25 per cent of a normal crop.

One Tulare County rancher has been harvesting grasshoppers in sacks extended by poles from the side of his automobile and is feeding the insects to his hogs.

According to grain buyers the district around Tulare is the best in the state for the production of "Gyp" corn and 75 per cent of the state crop is produced in Tulare County.

Dates of the fair at Patterson, Stanislaus County, have been changed from August 22-23 to August 15-16 so as not to conflict with the dates of fleet visit in San Francisco.

Hog auctions held at Tegner in conjunction with Stanislaus County farm bureau sales will now be held independently. The Stanislaus County sales will be held monthly at Turlock.

Allen Thompson and R. C. Sturgeon, president and secretary of the Tulare County Duroc-Jersey Association, addressed an organization of the Fresno County breeders at Fresno August 2.

George W. Bell, who acted as auctioneer at the recent Duroc-Jersey Association sale in Tulare has been engaged for the sale by the Tulare County Poland-China Association, sale to be held October 23 at Tulare.

Work of canning the Tulare County peach pool began at the cannery of the California Italian Products Company plant at Tulare, which has been leased by the California Cooperative Canneries of San Jose for the peach season. The crop was bought at $92.50 per ton.

Manager Niswander of the Peach Growers says that fully 25 per cent of the dried peach crop this year is sold direct to European nations; much of the remainder also finds its way to European consumers. Europe is hungry for fruit and willing to pay almost any price to get it.

The stock show committee of the Tulare board of trade is at work on prize lists for the fall stock show to be held October 6-11 at Tulare, and $2500 will be offered in the hog and cattle classes alone. Breeders from all parts of the state are making inquiries about the show.

Southern California

Hemet canneries have started on peaches.

Yucaipa and Oak Glen report heavy crops of apples.

It is expected that apricot pits will bring about $40 a ton.

San Diego County reports its biggest ever output of apricots.

Work on control of bean aphis has been started in Ventura County fields.

A larger planting of lettuce for the Imperial Valley is estimated next year.

The Yucaipa Apple Growers' Association is handling the early apples of its members.

Hemet apricot growers report serious losses because of peddlers stealing entire truck loads of fruit.

County Bee Inspector Stanley reports shipment of a carload of honey from Highland, valued at $8000.

The Redlands section reports probably 20 per cent more of olive output than her orchards gave last year.

San Diego County's output of beans, both Limas and small varieties, will be about two-thirds that of last year.

Brawley, Imperial County, reports large acreage being panted to milo. Contracts are reported for $53 per ton.

The irrigation company at Fillmore, Ventura County, is laying new pipe lines and increasing efficiency of its plant.

A $50,000 fire destroyed part of the Arlington cannery. Much of the machinery was saved and it is thought most of the stock.

Manager Thomas reports plans well under way for the great live stock exhibit at Exposition Park, Los Angeles, October 18-26.

Commissioner Kellogg of Santa Barbara County reports satisfactory control of the grasshopper pest which threatened the county.

Elsinore people are protesting against the draining of Lake Elsinore. The hearing day has been set by the state railroad commission.

Ventura bean growers are sending some pungent telegrams to Washington asking as to the importation of Japanese or Manchurian beans.

Apricot canning is over at the Elsinore cannery. It is expected that the tomato pack will be very heavy. Work on tomatoes will start almost immediately.

Cotton growers of the Blythe district in Riverside County have had to send laborers into the fields to straighten up the stalks knocked down by the recent storms.

Southern California will have two milch goat exhibits, one at the Southern California Fair at Riverside, October 7-11; the other at the Live Stock Show, Los Angeles, October 18-26.

Palo Verde Valley is finding that it will be necessary to advertise for cotton pickers. It is anticipated that section will produce at least 17,000 bales. Over 21,000 acres are to be picked.

E. O. Essig of Oxnard announces that not more than a half crop of limas is expected from the fields of the county. He also says that the Lima Bean Pool has not had a single carload of beans rejected because of quality.

The Coast and General

Crook County, Oregon, will hold its fall fair October 2-4.

An active campaign against Canada thistle has been started in Linn County, Oregon.

The schools of Arizona, exclusive of universities, will cost more than $1,000,000 the coming year.

The value of taxable property in Arizona is at least $25,000,000 more than the assessments of 1918.

One of the features of the state fair of Arizona this year will be a day devoted to the veterans of four wars.

Digger squirrels are becoming a pest in the orchards about White Salmon, Washington. This is a new pest in that region.

A broom factory is to be established in Phoenix, Arizona. Capacity to be from five to six hundred tons of broom corn annually.

Total deposits in all banks of the state of Arizona as reported by the bank comptroller for call of June 30 were $67,157,955.41.

Three hundred thousand trout are to be put into the streams of the White Mountains of Arizona by the state game warden.

The Alaskan railroad from Seward to Fairbanks, an ice-free port, will be when completed, 471 miles long. Most of the line is now ready for use.

Some losses of stock have been reported from the grazing of cattle in cantaloupe patches. It is supposed that the dying vines and melons become charged with hydrocyanic acid a deadly poison.

Walla Walla County, Washington, will ship out about 200 more cars of fruit this year than last. The Spokane district was more heavily hit by the June frost and shipments will probably be under last year's.

Fourteen tracts of state land on the edge of the Salt River project in Arizona, aggregating about 10,000 acres have been recently sold by the state land commission, the price ranging from $5.00 to $35.00 an acre.

The Salt River Valley Water Users' Association, Arizona, is to build an auxiliary steam plant to supplement the power developed by the water from the Roosevelt Dam. This will enable them to make use all of the time of the full power developed by the water at the season of greatest power, or 7000 kilowatts. It is expected that this will permit of the building of power lines throughout the valley for the use of farmers.

Farmers under the Salt River Valley Project in Arizona are making an effort to form a farm loan association to take advantage of the federal farm loan act. Under the law at the present time land under government projects is not eligible for loans. It is thought possible that if a sufficient number of farmers are interested a special ruling may be made for the purpose of loaning money under the project.

Among the 6000 delegates at the World Cotton Conference, to be held at New Orleans October 13 to 16 will be representatives of the long staple cotton industry from the Salt River Valley of Arizona. Among these will be Edward F. Parker, general manager of the Southwest (Goodyear) Cotton Company; F. W. Griffith, president of the Phoenix Chamber of Commerce; E. W. Hudson, member of the state horticultural commission, and Honorable Dwight B. Heard, owner of the Arizona Republican.

The Purity of Hydrocyanic Acid

THE insecticide and fungicide laboratory of the University issues the following statement as to determining the purity of hydrocyanic acid:

At present there are two companies manufacturing prussic acid for citrus fumigation in California: the Owl Fumigating Company, the originators of prussic acid liquifaction methods, which is beginning its second year of large scale production; and the Pacific R. & H. Chemical Corporation, Los Angeles, which has entered the field this season. The former plant is being remodeled to produce high grade prussic acid from a crude cyanide manufactured by the American Cyanamid Company. The latter uses a high grade sodium cyanide manufactured by the Roessler and Haaslacher Chemical Company as a source of prussic acid. Neither plant is entirely completed but appears to be keeping up with orders. Both concerns are optimistic that their plants will be in shape to handle the increasing volume of business as the fumigating season advances. The operation of the plants is being supervised by technically trained men, the empty containers are being carefully washed before refilling, and their contents are tested for purity before delivery, so that the future looks bright for an ample supply of high grade material for the present fumigating season.

The Insecticide Laboratory has recently tested the prussic acid produced by both companies at their plants and at a number of places after delivery to fumigators. All samples were above 98 per cent purity. These tests will be repeated from time to time throughout the season.

Through the publication of Bulletin 308 the experiment station has placed in the hands of the fumigators a ready means of approximating the purity of commercial prussic acid. Tables are given by which the percentage purity can be determined by taking the reading of a hydrometer floating in the liquid and noting the temperature of the liquid and referring to the tables.

A tall glass cylinder such as is used for checking the delivery of the applicator, may be used for taking the hydrometer and temperature reading but a closed container is obviously preferable.

A chargometer is a convenient apparatus for withdrawing the liquid from a delivery drum to avoid pouring out. This is a well-known instrument used for testing battery fluids and may be obtained from automobile accessory supply stations and from dealers in chemical apparatus. The hydrometer supplied with the instrument is for liquids heavier than water. It will be necessary to discard this and to purchase one for liquids lighter than water.

Hydrometers are carried in stock by the chemical supply houses. The type most readily obtainable and which is within the range of densities of prussic acid is the Baume hydrometer for coal oil and gasoline with a range from 45 to 90 degrees Baume. The instrument should not be more than seven inches long if used with the chargometer. It is preferable to obtain one provided with a thermometer so that both readings can be obtained from one instrument.

In making the test with the chargometer the hydrometer is placed inside the glass bulb, the rubber bulb is fully compressed and then the tip of the instrument is inserted into the liquid to be tested. The rubber bulb should be released slowly, thereby sucking up enough of the liquid into the glass bulb to float the hydrometer, If the instruments are warm the liquid will boil and interfere with the reading. In this case, a charge of the liquid should be sucked into the apparatus and expelled and then air aspirated in and out for a few minutes. This will cool the apparatus so that boiling is prevented. The hydrometer should be read from below the surface of the liquid, the reading being taken at that point where the straight line formed by the surface cuts the hydrometer stem. Liquid can be withdrawn from a partially filled drum by attaching a piece of rubber tubing to the tip of the chargometer. Rubber cement can be used to attach the rubber tube extension if the chargometer has a rubber tip, otherwise the end of the tubing can be slipped over the end of the glass tip.

California Can Produce Rootstocks

By G. H. Hecke, California State Department of Agriculture

ONE of the perplexing problems so closely touching the fruit growing business of the state and the entire Pacific Slope, partly as an aftermath of the great war, is the threatened deficiency in rootstocks!

To the fruit grower this question is one of vast importance. It was upon these sturdy, resistant rootstocks imported from Northern France and Belgium that he budded his millions of pears and apples, for up to this time American horticulturists have utilized these famous rootstocks to the exclusion of native products.

Now we are confronted with two conditions which, although temporarily working to great disadvantage in producing a shortage of imported rootstocks, must in the end serve a good purpose through the stimulation of the production of such stocks in the United States: Many of the sections of France and Belgium could not now furnish these rootstocks owing to their own needs and the fact that the departments given over to the growing of rootstocks have suffered devastation, and such importations are now proscribed through the enactment of Federal Quarantine No. 37 of June 1, 1919, which is intended as an added safeguard against the introduction of noxious plant pests and plant diseases which have produced such great economic loss to American horticulture and agriculture in the past.

Recently a bill was introduced in the house of representatives by Hon. Norman J. Gould of New York, and which has since been referred to the committee on agriculture for the purpose of providing for experimental work in connection with the production of home grown rootstocks.

The question is asked every day: "Can I grow such and such a fruit or crop in California?" The answer is: "You can!"

The wealth of varied soil conditions, the climate, usually lacking the extremes of temperature suffered by other parts of the United States and Eastern Europe, the natural barriers afforded by the mountain ranges on the east and the ocean on the west, all contribute to produce ideal conditions for the production of American rootstocks.

It is fortunate at this time that steps already have been taken to promote this important phase which contributes so largely to the interest of our fruit growing industry.

Opportunity is knocking at the doors of the nurserymen of California. Here can be grown the rootstocks not only for the ever increasing demands of the state but for those of the United States. Many nurserymen have been quick to see the possibilities for the future in this direction, as the large plantings will attest, and there is every reason to believe that the near future will furnish the ultimate satisfactory solution and the state of California will contribute rootstocks not only to the state itself, but to the entire country.

CURING PRUNES

A Butte County subscriber has requested information as to drying and dipping of prunes. An old time method given in the columns of the Cultivator. some years ago as described by Mr. Richmond, a large San Jose grower, is as follows:

'The green fruit is hauled to the dipper shed in picking boxes and there passed through a light solution of lye. A kettle or tank holding 200 gallons of water and a basket container is used for this purpose. In

MANUFACTURERS OF QUALITY FARM IMPLEMENTS SINCE 1865

"The SECURITY is all right!"

—says Geo. Studebaker, age 66, of Philo, Mendocino Co., Cal.

Mr. Studebaker read my standing offer to ship two or more of the

SECURITY KANT-WOBBLE LADDER

anywhere on approval—I pay the freight, you send no money until you have examined ladder thoroughly. When Mr. Studebaker received the ladders he wrote me as follows: "I am enclosing check for ladders. Your ladder is all right. I am 66 years old today and have been picking apples from the ladder. Mine is the first one ever used in these parts. I never had any use for three legged fruit ladder, but yours is certainly all right. Yours truly, Geo. Studebaker."

The offer is open to you, too. Write me today. I'll send you two or more ladders on approval. I pay freight, you pay when you examine ladder. If not pleased, return ladders at my expense. Write NOW before you forget it.

Prices: 8-ft. ladder $5.00; 10-ft. ladder $6.00; 12-ft. ladder $7.20.

To keep thoroughly posted subscribers should read every advertisement in the California Cultivator columns.

many instances the fruit is rinsed by passing from this dip into a vat of clear water and is then dumped onto a combination pricking board and grader, which grades the fruit into three grades so that the drying in the field can be uniform, the grader being operated by power. The fruit is then placed on eight-foot trays and taken to the drying yard and dried in the sun. The purpose of passing the fruit through the lye solution and over the pricking board is that the skin may be slightly cut, thereby preventing fermentation and producing a fruit with a clear bright meat. Many of the small growers do not use the combination pricker and grader; they dump the fruit directly from the dipper basket to the trays, allowing all sizes to be dried together. This is not as satisfactory to the grower as the first mentioned method. The most satisfactory and economical method of handling from the dipper shed to the dry yard is to use a one-horse truck especially constructed for this purpose.

"The question of drying is again a matter of judgment. Fruit should be allowed to lie in the sun on the trays until about three-quarters dried, and then be stacked in piles one above the other, leaving air vents on either end. About 20 trays can be stacked in one pile where the finishing process takes place. Under normal weather conditions it takes from ten days to two weeks to cure prunes. It has been found most satisfactory while the fruit is on the trays in the dry yard to give at least one turning by hand, shaking the trays, or with brooms, so that the fruit secures an equal drying on all sides. It also materially lessens the time of drying and makes a finer grade of fruit. Do not take your fruit from the trays until it is thoroughly cured. This word of caution means the salvation of your business."

Mr. Richmond does not give the proportions of the lye solution. A solution which is possibly stronger than the one referred to is given in a former Cultivator as follows:

The strength of the lye solution depends on the ripeness or condition of the fruit and degree of heat. If the prunes are fully ripe or partially dried and the water is not boiling, some use as strong a solution as one pound of lye to ten gallons of water. When care is used to keep the water at boiling it may be used as weak as one pound to 50 gallons.

The June Drop

TWO of our June drop items have been delayed because of special articles in the spray number and the crowded condition of the paper. The interest continues, for it is a most vital question to every citrus grower, in fact we may say to nearly every fruit grower, because citrus fruits are not the only ones which have this abnormal early summer dropping of the fruit. A subscriber at Porterville sends in the following:

A. H. Humiston

I was very much interested in the articles of the Cultivator of July 26 on the June drop. My neighbor has one tree in the corner of yard that he gives no attention except run water to it when he irrigates, and the tree now looks better and has a better crop of oranges than the trees next to it in the orchard. I am experimenting with cover crop on three acres of 16 year old trees. About the middle of May I planted one acre to buckwheat, the middle of June another acre to buckwheat and the third acre to Sudan grass. The middle of July I disked the first acre and there was enough seed ripe to start a good stand for another crop. The second acre I intend to disk in in August and plow the Sudan grass under in October. I have had plenty of water till now but indications are I will be short of water for the next six weeks. Will it be safe to risk or had I better dig up the crop and cultivate? There is very little fruit on the trees.

The Sudan grown until October would make remarkably fine addition to the soil if plowed under at that time with plenty of water, but if trees should suffer meantime for water the injury might be far greater than any possible benefit to the soil. Summer cover crops are to be grown only where there is sufficient moisture and always then with consideration of the needs of the tree first in mind. If the shortage is already here we would by all means remove the Sudan or any other cover.

* * *

Two articles which have been in hand since the first series appeared follow:

M. J. Pickering, La Habra, Orange County

Mr. Pickering was asked to inform us as to conditions in the La Habra Valley just east of Whittier. He investigated and one grower informed him that the situation was really serious. One orchardist reported that he has seen orchards which would not produce enough to pay pickers. There will be a larger percentage of full crop of Navels than of Valencias. The better class orchards will range around 80 per cent for Navels, while some Valencias show not more than 40 per cent of normal. Younger trees larger percentage of crop than the older ones. Trees with yellowing leaves retain practically no fruit, or, as one farmer expressed it, "There is no June drop on those trees; there is nothing to drop." One farmer said that the best all-round June drop preventive was stable manure, plenty of it, worked well into the soil which at all times is kept in good tilth. Don't irrigate too heavily, but at the same time keep sufficient moisture that trees are growing constantly. Summer cover crops are good if they can be grown, but it is hard to get them started in time to cover the ground before the first of June. Beans planted in the orchard during the month of May when the ground and air both were cold, refused to start to any extent. One grower reported part of orchard pruned this spring before June hot spell. Other rows were not pruned and there seems to be slight if any difference. "But again I must say that the best all-round conditioner is heavy application of manure deeply plowed under." Healthy vigorous trees, old or young, which have been kept in best of condition are generally carrying from 50 to 75 per cent of full crop.

Fred M. Reed, Riverside, Riverside County

I am estimating the next crop of Navels in this locality at 40 per cent of normal. Some groves are practically bare, while some have nearly a normal setting. From what I can see of the groves I work in and have to do with, there is as yet no consistent answer to the question of what causes the "drop." We had orchards in all stages of irrigation and cultivation and the only thing that seems to indicate a probable cause is the fact that the lots that have stuck a crop are usually those where stable manure has been used liberally, but there are too many exceptions to this to base any very definite conclusions on.

It is quite evident that heavy pruning is no advantage, as many lots that have been notoriously neglected as to pruning are doing very well as compared to the carefully pruned lots

We made no effort to evade the drop by any special method this season. So far as I have seen, the summer cover crop has not been of any advantage as to the percentage of fruit set. One of our neighbors has a lot that was all heavily pruned but three rows and those three pruned rows were the only ones that held their crop. It is to be hoped that the citrus experiment station plats in the old grove on Cleveland Avenue on Arlington Heights will furnish some authentic information on this subject this year, as they have all the commoner types of management as to fertilizing, pruning and irrigating side by side with reliable data on each.

As a result of the failure of congress to provide funds for the reclamation service, work in the Yakima Valley of Washington has been set back a year, even if congress makes an appropriation later

Bulletin on Fumigation

The agricultural experiment station of the state college of agriculture is issuing a two part bulletin, Number 308, on: "I, Fumigation With Liquid Hydroyanic Acid" by H. J. Quayle; "II, Physical and Chemical Properties of Liquid Hydrocyanic Acid" by Geo. P. Gray and E. R. Hulbert. The bulletin is of especial interest to citrus growers who are having their orchards fumigated. Even if the practical work of fumigation is left to the expert the grower has a natural desire to fully understand the processes through which the work is accomplished. We quote the summary and conclusions of that portion of the bulletin written by Prof. Quayle:

Liquid hydrocyanic acid, a new means of citrus fumigation, first used on a commercial basis in 1917, has rapidly come into favor.

The place where the greatest concentration of gas occurs under the tent from the liquid is practically the reverse of that from the pot or portable generator.

With the former method the most effective killing is at the bottom of the tree, while with the latter the most effective killing is at the top.

Aside from the scale insects, more than 75,000 ladybird beetles have been used in our comparative tests as an index of results.

The use of these insects has given discriminating data concerning the diffusion of gas under the tent, as well as on the efficiency of the different methods of fumigation, and these data have been verified by extensive field tests.

The greatest possible yield is 108 pounds or 18.56 gallons of anhydrous liquid hydrocyanic acid from 200 pounds of sodium cyanide (51-52 per cent cyanogen).

The amount of liquid hydrocyanic acid (95-98 per cent) that has been recovered at the plant during the past year has been about 78 per cent of the total available.

The amount of gas evolved by the pot or portable generator is estimated at 90 per cent of the total available gas.

During the past year 75 per cent of the gas from a given amount of cyanide in the liquid form was made to cover the same ground as 90 per cent from the same amount by the ordinary methods of generation.

Thus, while there has been a discrepancy of 10 or 15 per cent in the actual amount of gas used through the liquid method, the results in the field have not indicated any important difference on the scale insects.

Our own tests, however, both in the field and laboratory, have indicated about such difference as would be expected.

This apparent discrepancy between our own tests and commercial work in the field may be accounted for through the great variability in field work and by the difference, as has been determined, in the diffusion of the gas from the different methods.

Field examinations are usually limited to an examination of the scales within six or eight feet of the ground.

Our own tests have included the top of the tree as well. From these tests, when the results at the center and the bottom only were considered, there was practically no difference between the liquid and the pot, which harmonizes with the results in the field.

When the results at the center and top only were considered, the pot method was more efficient than the liquid method.

When the results in all parts of the tree are considered, it is necessary to use about 20 cubic centimeters of liquid hydrocyanic acid (96 or 98 per cent) to equal one ounce of sodium cyanide as given in the schedules of dosage now in practical use.

Units representing 20 cubic centimeters may therefore be substituted for the ounces, and the atomizing machines should be graduated to deliver 20 cubic centimeters for each ounce called for in the schedules.

WALNUT GROWERS BOOKLET

The California Walnut Growers' Association is issuing a small booklet, "Facts That Every Walnut Grower Should Know." This is a book containing questions and answers as to what is the California Walnut Growers' Association, when it was organized, who were the charter members, and a dozen other questions on to what is the feed department and other departments of the association, as well as description of the methods of increasing consumption and other questions on which members of the association should be informed. The book ends with a final word to the outsider and a page address by the president of the association, C. C. Teague in which he says: "For many years I have been a strong advocate of cooperative growers' organizations for marketing agricultural products, out of a firm conviction that it is only through the development of such cooperative marketing organizations that the agricultural products of the soil can be properly distributed and the grower receive a fair remuneration for his product and at the same time the consumer receive the product at a reasonable price."

American Grape Growing

"Manual of American Grape-Growing", by U. P. Hedrick, horticulturist of the New York agricultural experiment station, published by the Macmillan Company, New York, at $2.50.

This book is one of the regular rural manuals edited by Prof. Bailey. Other books in the series are "Manual of Gardening"; "Manual of Farm Animals"; "Pruning Manual"; "Fruit Diseases"; "Milk Products; etc. The author opens his preface with the statement that there are 79 books on grapes which enrich the pomology of North America, and in this number he does not count the numerous state and national publications. The strawberry has also proved attractive to writers, and 22 books have been written on that fruit; 14 on the apple; nine on the peach; five on the prune; nine on the pear; but the cherry, raspberry, and blackberry have not yet called for a separate and complete work. Notwithstanding the great number of books which have been published on the grape Mr. Hedrick says there is urgent need for a new book, for many of the former publications on the grape are many years old and methods have changed rapidly. There are also many new types of grapes and "The vineyard should be seen through many eyes'. The first halftones in the book are of two vineyards in California, and while we doubt not Mr. Hedrick's experience is mostly in New York, he is not a stranger to California's wonderful opportunities in grape culture. In fact in chapter two, touching upon grape regions and their determinants, he says:

"The Pacific slope takes precedence among the grape regions of the continent, exceeding all others combined in the production of grapes and grape products. California is the viticultural center of this great region, grapes being grown within her bounds from the foot of Mount Shasta on the north to Mexico on the south and from the foothills of the Sierras on the east to the forest that borders the coast on the west. So outlined, California might appear to be one vast vineyard, but it is only in favored valleys, plains and low hills in the territory bounded that the vine is sufficiently well suited to be productive. Outliers of this main region of the Pacific slope run north into Oregon, Washington, Idaho and even into British Columbia, forced more and more eastward the farther north to escape humidity from the ocean which northward passes farther and farther inland."

There are 18 chapters in the book touching upon The Domestication of the Grape; Grape Regions and Their Determinants; Propagation; Stocks and Resistant Vines; The Vineyard and its Management; Fertilizers for Grapes; Pruning the Grape in Eastern America; Training the Grape in Eastern America; Grape Pruning on the Pacific Coast; European Grapes in Eastern America; Grapes Under Glass; Grape Pests and Their Control; Marketing Grapes; Grape Products; Grape Breeding; Miscellanies; Grape Botany; Varieties of Grapes.

Heider

No Gears to Strip

Rock Island
One-Man Outfits
Heider Model D 9-16 with No. 9 Rock Island C T X two-bottom Power Lift Plow directly attached. Below, Heider Model C 12-20 with Rock Island No. 19 C T X two-three bottom Power Lift Plow. Foot-lever control. Automatic power lift.

Rock Island
No. 12 Tractor Plow
Successful behind any tractor. Front furrow wheel lift equipped with 2, 3 or 4 Rock Island C T X bottoms.
With Quick Detachable Shares

IN the Heider Friction Drive a strong fibre rim is mounted on the motor flywheel. The power is taken directly from the flywheel by two big metal discs—one to go ahead the other to reverse. The fibre does the driving and the discs pass the power to the drive wheels or belt pulley.

There is no gear stripping—for there are no transmission gears to strip. The tractor is always "in mesh." It is a resistless pull without jerking or vibration. *Seven speeds, forward and reverse*, are provided, all with one motor speed and one lever, for traction or belt work.

15 to 20% Fewer Parts

The Heider Friction Drive does away with clutch, transmission gears, and bevel gears. In all, it means 15 to 20 per cent less parts.

With fewer parts to run it puts *more* power into the pull. A steady flow of *flexible* power—just as much or as little as you want.

It saves repair expense. It adds years to the life of the tractor. And it is so easy to run that boys and girls are operating Heiders.

For 11 years this tractor has plowed every kind of soil, hauled big loads and furnished the power for all kinds of farm machinery. Its success is merited by 11 years of *performance*. You do not have to take a "demonstration" of one or two days as your guarantee of the Heider.

Two sizes, 12-20 and 9-16. Write for catalog of Heider Tractor and Rock Island Tractor Tools: the famous Rock Island Tractor Plows, 2, 3 or 4 C T X bottoms, and the Rock Island No. 38 one-man Tractor Disc.

The New 16 Valve
Twin City
Tractor
Pays Big Dividends

For the first time in the history of the tractor industry, the 4 cylinder, 16 valve engine (valve in head type) is now applied to a tractor. The TWIN CITY 12-20 with its 16 valve motor actually develops 25 per cent more than its rated horsepower.

This new 12-20 is a light weight tractor that will out-pull, out-last and out-dividend other tractors of equal rating.

Not built down to a price, but built up to a fixed ideal—to do the work assigned to it better than it has ever been done before.

The highest grade tractor will unfailingly prove the least expensive and pay the biggest dividends.

Questions and Answers

ANSWERS BY EDITOR AND STAFF

Questions to be answered in this department should be received at the office one week before reply is expected. Write plainly on one side of the paper and sign full name and address. Unsigned communications receive no attention.

Tomatoes Rotting

What is the cause and the remedy for tomatoes rotting on the vines while still green, and also after ripening? I water them on an average of every 15 days as the soil dries out and bakes rapidly. They rot before reaching two inches in diameter.—Subscriber, Los Angeles.

Without further particulars it would be impossible to tell whether this is anthracnose, or ripe rot, or blossom end rot. In case of anthracnose burn all affected fruit and spray with Bordeaux mixture, five pounds bluestone, six pounds lime, 50 gallons water. In case of blossom end rot, keep plants growing steadily, irrigate at regular intervals and deeply and cultivate thoroughly after each irrigation. Write Agricultural Experiment Station, College of Agriculture, Berkeley, and ask for Bulletin 239, "Culture of Tomatoes in California."

Cider and Vinegar

Will you kindly tell me how to make cider and vinegar? Have several tons small apples and no market for them. Have one barrel pressed out now and am told this juice will not make vinegar because of too much acid in the apples. This juice has worked and clarified now. — Subscriber, Santa Cruz.

Presumably the inquirer has the necessary apliances, that is, crushers, presses, etc.

Good cider can be made only from apples comparatively free from worms, rot and dirt and from apples that are ripe. Only good fruit will make good cider. The sour unripe fruit does not have sufficient sugar and the finished product can not be any better than the juice with which it starts. This does not mean that the fruit must be high grade merchantable fruit but simply it must have real quality in the juices. Carefully crush or pulp the fruit and express it as quickly as possible before it colors and loses its finest flavor. Put at once iuto clean barrels. The fruit if good should make about four gallons of juice per bushel. For drinking cider it may be bottled, or, if kept in barrels, use only clean alcohol or whiskey barrels. These should be thoroughly scalded with boiling water and washing soda and rinsed clean with pure water. For making the vinegar put the barrels in a room of 60 to 70 degrees temperature and fill with the pure cider to within ten inches of the bunghole, the barrel being on its side. If filled nearer than that it may foam and "boil" over, which is objectionable. Cover the hole with a piece of cotton to prevent entrance of dirt and insects but to permit escape of gases.

For preserving cider the best method is to bottle, using only heat for sterilization. This is according to the usual pasteurizing process. Benzoate of soda may be used as a preservative but this is not recommended by the department of agriculture. Another recommendation which may be somewhat questionable is to use calcium sulphite, one-fourth of an ounce per gallon. One subscriber writes he has tried this in 50 gallon barrel and it preserved it perfectly. Do not use the preservatives in cider which is to be marketed.

Regarding making of vinegar we repeat an answer given to a similar question in the Cultivator of December 7, 1918, by Prof. Cruess as follows:

"Use a small amount of ordinary bread yeast to start fermentation of the juice. A cake of compressed yeast will be sufficient for five gallons of juice. When the yeast fermentation is complete, which will be in about two weeks time, I would advise adding about one pint of strong vinegar to each gallon of the fermented juice. This will check the growth of mold. When the vinegar has become sour enough for use it should be placed in bottles that are filled absolutely full and corked tightly. If the scum which appears on the vinegar is slimy and tough it is only vinegar 'mother' and is not harmful to the vinegar. If the scum is white and wrinkled and easily broken it consists of 'wine flowers' which will spoil the flavor of the vinegar. The addition of one pint of strong vinegar to each gallon of fermented juice will prevent the formation of this 'wine flowers' film. If the vinegar has become moldy there is practically nothing that can be done to remove the moldy taste. It is sometimes possible to remove part of the moldy flavor by shaking the vinegar with a small amount of cotton seed or olive oil."

Legal Queries

Louis B. Stanton, attorney, 243 Wilcox Building, Los Angeles, will answer legal queries in this department.
Immediate mail replies cannot be given except where fee to Mr. Stanton is paid. When replies are wished in Cultivator address query to 115½ N. Broadway, Los Angeles.

Time to Close Estate

An estate has been probated and claims filed. How long must it be held open to filing of the claims of creditors and what fees are attorneys allowed?—Subscriber, Orange.

If the estate is under $10,000, it cannot be closed within four months after the first publication of notice to creditors. If it is over $10,000 ten months must elapse after the date of first publication of notice to creditors. The statutory fees of executors and administrators in the matters of estate are seven per cent for the first $1000; for the next $9000 four per cent; the next $10,000 three per cent, and thereafter reducing accordingly. After all claims of all creditors are proven, the final account and petition for distribution by the administrator must be filed and heard, decrees of distribution entered and thereupon the properties of the estate distributed, unless it may be necessary to sell some part of the estate in order to pay the claims, costs, or to properly divide the property among the heirs.

Road Fenced In

My husband bought a ranch 25 years ago, along the side of which ran a road in use since 1872. The side of the ranch was fenced, 15 feet being left as half of the roadway. Twenty-five years later the land alongside the ranch was leased; the lessee fenced the leased ranch, placed posts against the wire of my husband's ranch, taking in 15 feet which he has cultivated, and has cut off my road from the ranch, leaving me no outlet. This has run on for some months. My husband died some time ago. How can I protect my rights?—Subscriber, Jamacha.

The fact that a road has been used by the public for any length of time merely gives to the public an easement for road purposes over the land so used. The title of the land itself remains with the owner. The owner of the land would therefore be entitled to bring an action in ejectment against the party so leasing and fencing the roadway, and as an incident to that action would doubtless be able to collect whatever damage may have been suffered as well as the value of the crops which have been planted. In this case in order to maintain such action of ejectment plaintiff must have the legal title to the property. The facts do not state as to whether or not the estate of the husband has been probated. In order to bring this action, if the title was in the husband, it would be necessary for the widow to commence probate and have an administrator appointed who would then be vested with the legal title sufficient to maintain such action.

Tomato Contract

I made a written contract with four men to raise tomatoes on my 40 acres, I to furnish everything except labor which they were to furnish. Three of them, before the job was completed, left; the fourth brought in a new man; only 20 acres of the plants remain; the fourth man claimed that the loss of 20 ares was caused by improper planting. I have done everything to fulfill my part of the contract. The tomatoes are sold to the canners and picking starts at once. May I claim damages for the loss of the 20 acres of plants? Contract calls for an equal division after money is received. If so how will I proceed?—Subscriber, Porterville.

If the loss was occasioned by improper planting or improper care you would certainly be entitled to your damage therefor. It would doubtless be the case that the four original parties were partners and that the new man coming in would be obligated to stand in their shoes. Whether he was an employe of the surviving partner or accepted as a new partner does not quite appear. You could doubtless bring action for breach of their warranty as competent tomato raisers and attach in the hands of the cannery the monies which would come to the surviving partner, and thus hold it for the termination of the suit.

Bees a Nuisance

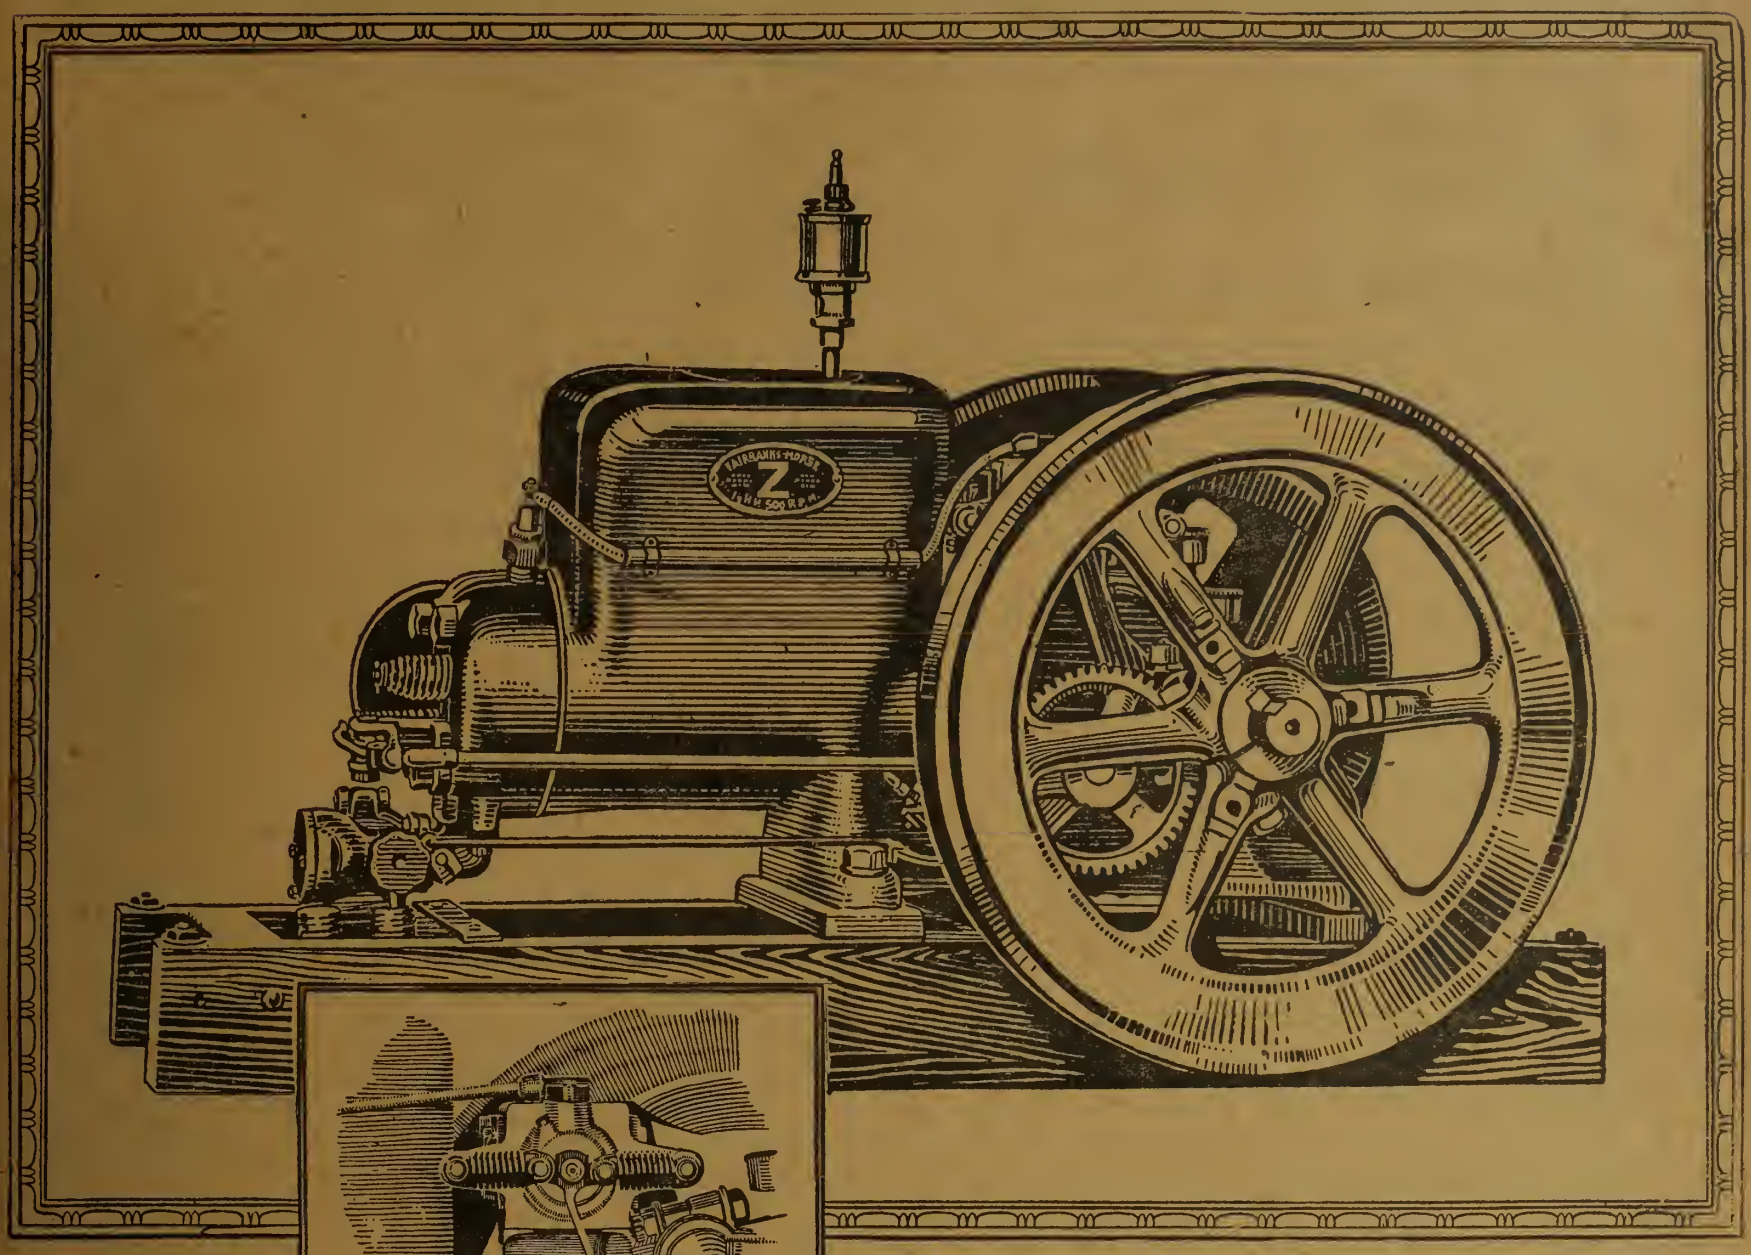
A month ago an apiary of 500 stands moved within a mile of my place. The bees eat the fruit both on the trays and on the trees so that it is difficult to pick it without getting stung, and they have caused serious damage to my fruit. What redress have I? Can the owner be made to move them? Last year they bothered in the same manner.—Subscriber, Yucaipa.

A nuisance is defined among other things as being anything which is an obstruction to the free use of property or which interferes with the comfortable enjoyment of life or property. The facts stated in the foregoing question would undoubtedly constitute the maintenance of this apiary a nuisance. The remedies are a civil action for an injunction and abatement. There is a New York case which has held that annoyance and discomfort caused by the keeping of bees was a nuisance and constituted proper case for the issuance of a permanent injunction. The difficulty in the matter would be to identify the bees, as you could not enjoin a man from maintaining such bees as a nuisance unless you could prove that the particular bees which belong to the man were the ones that caused the nuisance.

Homestead

Can a wife claim homestead entry on a homestead for which the husband has received the land office's final receipt but has not as yet received his patent? If the husband dies, does the wife become the unconditional owner of the property even if there are children? If the wife dies, may she dispose of this property by will? If such homestead claim is held by the wife can the property be legally transferred or sold by the sole action of the wife?—Subscriber.

Before the homestead entryman has become entitled to his patent he has no such interest as would make it on his death a part of his estate, but by the statute his surviving widow may compel the residence required by law and thereupon become entitled to patent. But if the entryman has obtained his final receipt and complied with all the obligations of the law so that his right to a patent has become perfect, he is invested with a full equitable title. In case of his death in the interim the title to the land inures to and becomes vested in the heirs and assignees of the deceased patentee, as if the patent had been issued during his lifetime. In such case it would be subject to disposition by the will of the patentee, or in case he left no will, then by the probate laws wherein the land was situated If he left no will and left children, the children would be vested with an interest in the property, and the wife could dispose of only such portion as would be decreed to her by the distribution of the estate of her husband. The homestead claim in question in the state that this one is may be legally transferred or sold, as it is the property of the entryman and the government holds the bare legal title in trust for him.



Fairbanks-Morse "Z" Engine with Bosch Magneto

Now-There is Only *One* Farm Engine

JUST think of the famous "Z" engine with a Bosch high tension, oscillating magneto — which delivers a steady succession of hot, intensive sparks. ¶ Every farmer in America should at once call on the nearest "Z" engine dealer and see the result of this recent epoch-making combination — FAIRBANKS-MORSE "Z" WITH BOSCH MAGNETO. ¶ Mechanical perfection, plus power — and right price — to date sold the "Z" to over 250,000 farmers. ¶ This quality and quantity production enabled us to contract for a large proportion of the extensive Bosch facilities for making this one possible "Z" betterment, which establishes a new farm engine standard. ¶ And over 200 Bosch Service Stations assist all our dealers in delivering maximum engine service. ¶ Prices — 1½ H. P. $75.00 — 3 H. P. $125.00 — 6 H. P. $200.00 — All F. O. B. Factory.

Scale Logic

The Black Scale is almost all hatched. Some has been hatched for three months. If you fumigate now you may get a good kill on the Black Scale but you will not kill the unhatched Purple. If you wait until the Purple is ready for fumigation it will be too late in many cases to get a good kill on the Black. Result—orchard still dirty. Orchards that were dirty and non-productive five years ago, are now clean and paying large profits as a result of using Tizit Spray each year.

Get in line with the fellow who said the other day "I've always been prejudiced against sprays, but I'm bound to admit that Tizit is O. K. I would have been ahead hundreds of dollars if I had commenced using Tizit when my neighbors did."

Learn more about this efficient Black and Citricola Scale eradicator. A letter or post card inquiry will be cheerfully answered and place you under no obligations whatever.

Our citriculturist, Mr. Wylie, will confer with you on request.

Western Canada's "Horn of Plenty" Offers You Health & Wealth

Western Canada for years has helped to feed the world—the same responsibility of production still rests upon her. While high prices for Grain, Cattle and Sheep are sure to remain, price of land is much below its value.

Land capable of yielding 20 to 45 bushels of wheat to the acre can be had on easy terms at from $15 to $30 per acre—good grazing land at much less.

Many farms paid for from a single year's crop. Raising cattle, sheep and hogs brings equal success. The Government encourages farming and stock raising. Railway and Land Co's. offer unusual inducements to Home Seekers. Farms may be stocked by loans at moderate interest. Western Canada offers low taxation, good markets and shipping; free schools, churches and healthful climate.

For particulars as to reduced railway rates, location of land, illustrated literature, etc., apply to Supt. of Immig., Ottawa, Can., or

Your Soil Needs

Humus and Nitrogen Bacteria

MELILOTUS INDICA Supplies Both

Now is the time to plant it. Buy your seed from

Aggeler & Musser Seed Co.

620 S. Spring St., Los Angeles, California

Buy only Melilotus seed that has a quality tag on each sack. It protects you against the low germination seed so general on the market this season. This seed is above 99 per cent pure and above 90 per cent germination.

To keep thoroughly posted subscribers should read every advertisement in the California Cultivator columns.

Some Prunes

THE first prunes of the 1919 crop in the Santa Clara Valley have been picked and delivered to the association packing houses, according to a statement made today by H. G. Coykendall, general manager of the California Prune and Apricot Growers, Inc.

This means that shipments of this year's pack will be made before the end of August and that with the promised warm weather which is looked for the last of this month heavy shipments of prunes will be sent out from the Santa Clara Valley during September.

Reports received by Coykendall from the association field men in other prune districts of the state show that this year's crop will have a large early yield in every important producing county unless unfavorable weather conditions interfere to retard the ripening of the fruit.

First delivery of prunes to the packing houses before the middle of August sets the beginning of the 1919 season several weeks ahead of the date when the fruit began to be received last year.

Growers, members of the cooperative association, will be paid 15 cents a pound for their largest fruit, running 20 to the pound, as soon as the fruit is delivered at the packing house. For sizes ranging from 30 to 100 to the pound they will be paid on an eight cent basis on delivery and for the smaller sizes five cents. Full payment will be made by the association to its members after the fruit has been distributed in the world's markets.

The association estimates that it will handle 180,000,000 pounds of prunes for its members this year, which at the prices to be paid the growers, will net them about $25,000,000. Half of this sum will flow into their pockets within the next three months under the arrangement by which they are paid approximately 50 per cent for their fruit on its delivery.

The Canadian market will receive the first shipment of dried apricots to be sent out of the Santa Clara Valley this year by the association. A carload of mixed grades now being made up will be shipped to Canada before the end of this week according to a statement made today at the association headquarters.

Other apricot districts of the state have already shipped several cars of dried apricots to New York and Chicago and other eastern markets and additional cars are expected to be sent out much more rapidly from now on.

Vacuum Process of Dehydration

"Although the preservation of food by drying is an old art, it was not until recently that the problem of food dehydration received any serious scientific study," says a writer in the Popular Mechanics Magazine. "As a result of many experiments here and abroad, we are now in possession of enough facts to enable the development of the food drying art into an industry of large proportions. There have appeared on the market preparations of dehydrated vegetables produced by some air-current system in which the cut vegetables are heated in a current of warm (dry or moist) air until the product is considered dry enough to keep. The results of this type of vegetable dehydration are quite well known. It must be noted, however, that the air-current system has two marked disadvantages. First, it is uneconomical, wasting about three-fourths of the fuel employed; and, second, it is not applicable to a variety of products, the most important of which is meat. We are familiar with South American jerked beef and air-dried fish. Those who have tasted either of these will realize the difference, in flavor and appearance, between them and the fresh product.

The necessity for further development in dehydration of these products and the need for a more economical system was clear.

The task of evolving a process and developing a product suitable for use in the field was assigned to Drs. K. G. Falk and E. M. Frankel by the surgeon-general. In this they were successful, and there is now available for public use a method by which foodstuffs of any kind may be dehydrated and reduced to a condition in which they can be kept indefinitely without the use of refrigeration or preservatives, the latter term including smoke, salt, saltpeter, and sulphur dioxide.

"Briefly, the process—originated at the Harriman Research Laboratory in New York City, and industrially worked out at Columbia University—is a vacuum method, in which the foodstuffs without any previous preparation except ordinary cleaning are heated in an air-tight chamber, from which the air and other gases or vapors are exhausted. Under these conditions the water in the food product, which ordinarily boils at 212 degrees Fahrenheit, can by proper adjustment of the vacuum, be made to boil at 100 degrees Fahrenheit. Thus, the foodstuff is never overheated, and no coagulation of protein materials or other changes induced by high heat are brought about. As a result of the low temperatures employed, the volatile aromatic oils which give most vegetables and fruits their characteristic tastes, are retained. In contrast to the air-current system, drying in vacuum takes place from within the mass rather than from the surface, so that the outside of the pieces of food is not made tough and sometimes impermeable to water, as is the case with air-dried products. Again, many articles of food cannot be dehydrated in a current of air because of their tendency to darken unless they are treated beforehand to prevent discoloration. Thus, for instance, potatoes, both sweet and white, must be steamed first, while apples and other fruits must be impregnated with sulphur dioxide before drying. With the vacuum method it has been found unnecessary to resort to any of these preliminary treatments. Similarly, in the dehydration of meat and fat fish, it is possible, due to the absence of air, to preserve the fatty components without any tendency to rancidity."

Spray for Cabbage Worms

Cabbage plants are often seriously injured and the crop entirely destroyed by a number of cabbage worms. Some of these are the common cabbage worm, the cabbage looper, the cabbage plutella and cut worms. The adults of these are moths or butterflies which lay their eggs on the cabbage leaves. These eggs hatch in a few days and the young worms feed on the foliage. They grow rapidly and by the time the cabbage is beginning to head they may be very numerous. It is then that they do the most damage by causing imperfect heads or heads which will not keep.

These worms may be killed, says the University of Missouri college of agriculture, by spraying the cabbage plants with an arsenical poison. Dissolve four pounds of laundry soap in several gallons of water. Add enough water to make 50 gallons. Then stir in 1½ pounds of powdered arsenate of lead or three pounds of the paste form. The soap is to make the liquid spread better and to make it adhere to the smooth surface of the cabbage leaves.

To make a smaller amount of the spray use one-half ounce of the powdered arsenate of lead or one ounce of the paste, an inch cube of soap, and one gallon of water. Spray on the foliage so as to get all parts of the plant protected. Apply as soon as the worms are noticed doing damage or shortly after the plants begin to grow well. Several applications at intervals of ten days or two weeks may be

necessary to control the pests.

Dusting may be substituted for spraying if desired. Use one part of the powdered poison to four parts of air-slacked lime or flour. Mix thoroughly and dust on the plants from a porous bag, or a can with nail holes in the top. Apply thinly while the dew is on the plants.

Since the cabbage head grows from the inside there is absolutely no danger from poisoning by eating the cabbage. If outer leaves are removed (and they always are) spraying is safe up until time to harvest the crop. Spray early in the season and it will not be necessary to spray when the heads are forming.

THE MASLIN FIG ORCHARD

Continued from Page 169

ling was secured by crossing Mission with Maslin capri No. 148. It is of medium size, irregular globular in shape, with no neck, skin thin and delicate, dark purple, almost black towards the apex, and translucent in the shade.

A cross of large Black Douro with a purple capri, Maslin No. 91, has produced remarkable results. Out of ten seedlings sent to C. A. Culp of Pacific Grove, most of them are capris. One of the latter is a light pea green in color and probably one of the largest capri figs known, ranging in size from two to two and one-half inches in diameter. Several of the capri are purple. One of the edible figs is medium size, jet black at full maturity. It is a rich, sweet fig, better than the Mission.

A first class fig, derived from crossing the West, No. 14, and a capri of the Maslin orchard, has been produced by one of these seedling growers at the United States station at Indio. In color and shape it resembles Lob Ingir, though not quite so large as that variety. Although of a Smyrna strain it matures without caprification, and unlike some Smyrna varieties in that hot, arid climate, drops from the tree when mature and dry, like the Lob Ingir, instead of holding on, mummifying and losing its flavor. On account of its ample foliage of large leaves it seems well adapted to the desert region.

As thousands of seedlings distributed to various parts of the state come into bearing, a considerable number of new and exceptionally fine figs are developing and will soon add many excellent varieties to the list already in cultivation.

FAIR DATES

Patterson Fair, Patterson, August 22-23.

California State, Sacramento, August 30-September 9, Secretary Chas. W. Paine.

San Diego County, Balboa Park, San Diego, September 9, Secretary Mellinger.

Los Angeles Live Stock Show, Los Angeles, October 18-26, Secretary C. R. Thomas.

California International Live Stock, San Francisco, first week in November, Secretary Gordon H. True.

NAPIER GRASS

The University of Florida has issued a bulletin on Napier grass, introduced to this country only a few years ago. As to its distribution and history the bulletin says:

Napier grass is a native of tropical Africa. The Rhodesian department of agriculture has the distinction of having first introduced it into cultivation. This was about 1910. In 1913 the United States department of agriculture first introdueed it into this country. Here it promises to be valuable for planting in the extreme South, including the entire state of Florida, and a strip extending through the southern portions of Mississippi, Louisiana and Texas. It also promises to be successful in Southwestern Arizona and the warmer portions of California. Work with it was first started at the Florida experiment station in 1915. Since that time it has been grown cooperatively or distributed in small lots for planting in many widely separate sections of the state.

ONTARIO AGRICULTURAL SCHOOL

Attendants at the Smith-Hughes courses, held under the supervision of State Supervisor Lillard at the agricultural school of Ontario, have united in words of commendation as to the manner of conducting of school touching upon vocational subjects. The signers of the statement as to the work given at the school say:

"Ontario is to be congratulated on her school facilities and the faithful, efficient and devoted teachers who enter into their work with a zest and whole-heartedness that commands success.

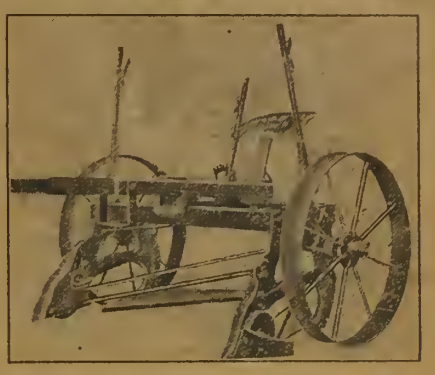
We desire to commend to state officials and others the entire suitableness of Chaffey Union High School as a place for future meetings of the kind, such as has just been held here this summer."

The signers are Messrs. Raymer, Mullins, Newbold, Holmes, Condee, Wardrip, White, Montgomery, Finch, Johnston, Alcorn and Pettus.

DISCUSSION OF SOIL MAPPING

Our readers with a liking for thoroughly scientific discussion of soils will be interested in "Are Soils Mapped Under a Given Type Name by the Bureau of Soils Method Closely Similar to One Another?" written by Robert L. Pendleton and published by the University of California Press, Berkeley, at $2.00 per copy. The book has a foreword by Prof. Chas. B. Lipman. The author does not fully endorse the methods of the bureau of soils and in this Prof. Lipman disagrees somewhat with the author. As noted above it is a strictly scientific discussion and will have little of real interest for the practical farmer.

Southern California's production of Black-eye beans and Limas will be materially less than that of last year.



The Improved Caledonian Riding Bean Harvester

The Caledonian is without doubt the best bean harvester ever used in California. Mounted on steel wheels it requires less power, it does better and faster work than a sled type and will outlast two sleds—a considerable saving. It has a three lever adjustment. All parts in stock, including extra blades.

Minutes Count When The Grain Is Ready To Cut

EVERY farmer knows that Harvest time, when the crops of a season's labor must be gathered, demands prompt action. *Minutes count.*

Any tractor-engine trouble means costly delays to him, idle hands and grain lost which might be turned into dollars.

The hot, dependable sparks delivered by the K-W High-Tension Magneto, insure constant no-trouble ignition, guaranteeing service from the tractor 24 hours a day if necessary.

The K-W High-Tension Magneto is of the simple inductor type construction. There are no troublesome commutators and brushes, revolving wires or collector rings, no moving wires or sliding contacts. All connections on the K-W Magneto are permanent and stationary.

The K-W Magneto is equipped with an Impulse Starter, insuring *instant starting* of the engine, no loss of time in beginning the day's work—no interrupted service afterwards.

Spring, Summer, Autumn, Winter, the tractor that is K-W equipped can be depended upon under all weather and working conditions to develop the maximum power out of every drop of fuel used, regardless of the kind or how low the grade.

K-W Magnetos were built *for tractors* and their reputation for reliability has been proved *in tractor service.*
Write for literature and list of K-W equipped tractors.

— Public Sale —
Live Oak, Calif., Saturday, Aug. 23

70 Head of Boars, Sows and Gilts 70

The offering to be sold on the above date is in every way up to the high standard set by my former sales and will consist of boars, sows and gilts of a character to suit any buyer—the established breeder, the beginner or the man wanting one or more boars to increase the profits from his pork operations. Every animal sold has been immunized against cholera and swine plague by Purity anti-hog cholera serum and mixed vaccines. You run no risk. All are sired by one or another of my famous herd boars—AMES RIVAL 100TH, LIVE OAK CHAMPION and MAYFIELD SUPERBUS.

The sale includes three out-standing show sows; 12 under-a-year sows; 20 young gilts; 30 boars, among them at least 10 high class herd boar prospects.

Two Herd Boars Sell

I will also sell the two-year-old boar LIVE OAK CHAMPION, reserve grand champion at the 1918 state fair, and Mayfield Superbus, a son of the great Superbus. Two better boars will not sell this year.

Make Silo Walls Air-Tight

WITH the silo filling season approaching, a careful examination of silos, followed by necessary repairs, will help to improve the keeping quality of the contents. According to studies of the United States department of agriculture air-tight walls are the chief requirement; in fact, a leak no larger than a small nail hole may spoil several hundred pounds of silage. In the case of wood-stave silos the hoops and braces should receive attention to insure close fitting.

Silos made of concrete, brick, or other material of porous or semi-porous nature, are benefited by an inside coating of a preparation which seals the pores and also prevents the action of silage juices on the walls.

The coating most commonly used hitherto is coal tar thinned with gasoline and applied with a paint brush. A number of materials of like nature have been considered for this work, but the one showing the most promise is paraffin.

How to Apply Paraffin

Paraffin may be applied either cold or hot to silo walls. With the cold method, the paraffin is dissolved in a volatile carrier like naptha until a saturated solution is obtained. Four pounds of paraffin dissolved in one-half gallon of gasoline or naptha will make one gallon of this solution. The solution is then applied much like paint to the surface of the concrete, which it penetrates according to dryness and porosity. One gallon has a covering capacity of about 200 square feet.

The naptha soon evaporates, leaving the paraffin in the holes. When applying the paraffin by this method, special care must be taken that there is good ventilation in the silo and that there are no lights or fires nearby. Naptha is very inflammable, and a serious explosion or fire may result from careless use.

Walls Must Be Warm

Paraffin may also be applied in melted form. It requires six and one-half pounds of paraffin to make one gallon of the hot paraffin solution. The work should be done on a warm day and the concrete must also be sufficiently warmed by artificial heat so that the paraffin may be thoroughly rubbed in. One gallon will cover about 250 square feet of surface. When this method is followed, a blow-torch should be used to warm the walls as the paraffin is being applied, and also to thin and spread the layer of paraffin. Two buckets of paraffin should be used, one to be heating while the other is being applied. The hot-paraffin treatment is one of the most successful for waterproofing surfaces exposed to weather, but it requires some experience to obtain successful results.

The amount of paraffin required to coat a silo may be determined in the following manner:

Multiply the height of the silo by its circumference (the circumference is the diameter multiplied by 3.1416), which gives the number of square feet of surface on the inside of the silo. If the cold method is to be used, divide the result just obtained by 200, which gives the number of gallons of the paraffin-naptha solution required. Multiply this result by the amount of paraffin and naptha in each gallon to obtain the total materials required.

Use of Hot Method

Where the hot method is used, divide the number of square feet of silo wall to be coated, by 250 to find the required number of gallons. Multiply this result by 6½ to obtain the number of pounds of paraffin required. For example, to find the paraffin required to coat a silo 14 feet in diameter and 30 feet high:

Diameter (14 feet)x3.1416 equals 43.98 feet, the circumference of the silo.

Height (30 feet)x circumference (43.98 feet) equals 1319.4 square feet, the wall area.

Area (1319.4 square feet) divided by 250 square feet equals 5.27, or number of gallons required.

Gallons required (5.27)x6½ equals 34.25, the number of pounds of paraffin required.

In both cases the cost may be estimated from the local price of paraffin and naptha. It should be remembered, however, that these figures will vary with local conditions.

Rules for Shipment of Live Stock to Fairs

By Wayne Dinsmore, Secretary, National Society of Record Associations.

Livestock men throughout California who contemplate exhibiting at fall fairs will be surprised and gratified to learn that the United States Railroad Administration has recently issued rules effective May 15, 1919, governing the handling of exhibits for expositions and fairs, whereby live stock chiefly valuable for breeding, racing, show purposes and other special uses will be granted what amounts to a half rate in making the fair circuit. This applies to horses, cattle, sheep and swine.

The rules stipulate that when exhibited at one exposition or fair, and then returned direct to point of origin, said live stock will be carried at full tariff rates going and free returning, if returned within 30 days after the close of the exposition or fair at which they are exhibited and the bill of lading therefor is accompanied by certificate of the secretary of such exposition that such articles were exhibited and have not changed ownership. This will apply where exhibitors make only one fair.

The rules further provide that when moving over a circuit of expositions or fairs, the articles will be way-billed at the regular tariff rate to each point of exhibition, and at the close of each fair, on presentation of a certificate from the secretary of the fair that such articles were exhibited thereat and that no change of ownership has occurred, the inbound charges will be reduced to one-half of the tariff rates, and when reshipped from the last point of exhibition to the original point of shipment via direct routes and the bill of lading is accompanied by similar certificate from the secretary of the last fair or exhibition, one-half of the tariff rates will be applied on this final shipment home. This permits all exhibitors of pure bred livestock to make a single fair or a circuit of fairs at one-half the cost heretofore encountered, for the majority of shippers, particularly horsemen, have had to pay full fare both going and returning in years gone by.

The "joker" in the rules is a stipulation that the animals will be carried at this reduced rating only when carriers' liability is limited to certain specified valuations, to-wit:

Each horse or pony (gelding mare or stallion), burro, donkey, mule, jack or jenny	$150.00
Each colt under one year old	75.00
Each ox, bull or steer	75.00
Each cow	50.00
Each calf, 6 months old or under	20.00
Each hog	15.00
Each sheep	5.00
Each goat	5.00

This will make it necessary for shippers to either run their own risk of loss or carry insurance on exhibition stock in some of the regular insurance companies, but it will be far cheaper to insure exhibition animals and thereby take advantage of the reduced rates than to pay full freight rate going and returning.

All shippers should proceed at once to see that their men in charge of exhibits have copies of the freight tariff giving full details, to-wit Boyd's No 145 showing rules governing the handling of exhibits for expositions and fairs, page 5. Any local railroad agent can obtain this for shippers.

Chief credit for obtaining these concessions must be given to the American Association of Fairs and Expositions which, with others interested has been at work to obtain this concession for more than three years.

past. The rulings apply to all railroads under federal control.

Note: Secretary Paine has been informed that no free rates on stock exhibited at the California State Fair will be granted exoept on the old Central Pacific lines.

ATTRACTIONS IN BERKSHIRE SALE

A feature of the Carruthers Berkshire sale to be held at Carruthers Farms, Live Oak, August 23, will be the sale of the reserve grand champion boar at the 1918 state fair, Live Oak Champion. This boar was sired by Ames Rival 70th, and his dam is Rival Lady 34th. This sale will also furnish an opportunity to secure daughters from what are believed to be the only two living daughters of the noted boar, Rival's Champion, whose blood has been such a factor in the history of the Berkshire breed. Other attractions in the sale will be the sows, Live Oak Belle, a daughter of Rival Lady 34th; the junior yearling sow, Live Oak Lady and Live Oak Belle 2d. The last sow will sell with a litter of six pigs. About 70 head of boars, sows and gilts will be included in the sale. Carruthers' Berkshires have always been held in high regard by Western breeders and this herd holds the record for public sale averages for the years 1916 and 1917.

Col. Ord L. Leachman will be the auctioneer.

COMBINATION HOLSTEIN SALE AT STOCKTON

A public sale offering of 65 highly bred registered Holsteins will be made at Stockton, on Thursday, September 18, by Henderson Company, Sacramento, and Bonita Stock Farm, Lodi. This will be the first public sale of registered Holsteins held at Stockton, which is the center of a very large dairy section, and quite a number of dairymen in the community have already signified their intention to acquire a few pure breds in this sale. A large number of the females in the sale will be heavy with calf to the noted King of the Black and Whites, who now has 39 A. R. O. daughters, the largest list of any bull on the Pacific Coast. Word has also just come from the east that one of his daughters has just made over 800 pounds butter from over 20,000 pounds milk in one year as a junior two year old. The sale is being managed by California Breeders' Sales and Pedigree Company, Sacramento.

PRESTON SCHOOL TO SELL AYRSHIRES

The good herd of registered Ayrshire cattle owned by Preston School of Industry, Ione, will be dispersed at public auction on Tuesday, September 16, at the State Fair Grounds, Sacramento. The herd consists of approximately 60 head of cows, heifers, and bulls of substantial breeding. The foundation of this herd was selected from some of the best known herds of the United States and Canada and the wide selection offered in this sale will permit those who wish to start new herds in California a rare opportunity to buy. The sale will be under the management of California Breeders' Sales and Pedigree Company, Sacramento.

IT WILL BE BIG

The state fair opens August 30. The mammoth $300,000 main state agricultural building, which is the pride of the fair association, is receiving its internal finishing.

When the lists closed August 1 the fair association had 1000 entries in the hog exhibit alone. This is accounted for by the activity of the boys clubs throughout the state. The boys have taken a most unexpected interest in pure bred hog raising. The incentive of competition and possibility of neighborhood prizes has advanced the hog industry more in the past two years than it advanced of its own account in the previous ten.

Under the supervision of the county agents and in some instances local enthusiasts, the boys have selected types of hogs which are best adapted to their locality. This insures a variety of types on exhibit, each hog being the product of careful breeding and the best of care. Several of the communities are sending boy representatives with the entries.

The unloading facilities have been enlarged under the supervision of Chas. W. Paine, secretary, and every effort is being made for proper handling of all live stock exhibits.

WILL GIVE AWAY GILT AT FRESNO

It is customary to attend auction sales with the idea of buying, but each one who attends the inaugural sale to be held at Fresno, August 20 by the Fresno County Poland-China Breeders' Association will have an opportunity to become the owner of one of the choice spring gilts without putting up any cash. As feature for the sale the management has decided to hold a drawing in which all may participate without cost, and the prize will be a registered gilt.

The sale, which will be held on the Fresno fair grounds, will consist of 30 bred sows, 17 bred gilts and eight open gilts. The association is anxious to make the first sale unusually attractive and the members have been very generous in permitting the management to select an offering that will attract the best buyers. The blood lines represented are the best available, and bred stuff sells to the service of such well known boars as Vaughn Jones, Hathers' Big Bob, California Jumbo Buster, and Blue Valley King.

PROFITS FROM YOUR SILO

– It has long since been proved that the silo is the one economical and profitable way to feed dairy cattle. The same amount of feed will go farther when turned into ensilage than if fed in the ordinary manner. Then, too, it is more appetizing and nutritious. All stock like it. It means healthy cows, more milk and greater profits *for you.*

Right now is the time when an *Ideal Green Feed Silo,* filled with rich, juicy, milk-producing silage, would make it unnecessary for you to feed high-priced grain, and yet would put more milk in the bucket every day. *Dairymen and farmers who have silos are securing 25 per cent greater production from their cows than those using dry feed.*

All agricultural authorities recommend the wood stave silo. It is inexpensive, easy to erect, needs no attention, is not affected by climatic changes, and will last a lifetime if built of the right wood.

The Ideal Green Feed Silo

is made from clear California Redwood, which long experience has shown to be the wood best adapted for silo construction.

The staves are tongued, grooved, bevelled and splined by specially built machinery. The doors are of the refrigerator type, leakproof, and cannot jam. They are continuous from top to bottom of silo.

Ideal Green Feed Silos are equipped with heavy, soft-steel hoops, made to withstand all conditions, and are strong enough to last for years. Hoops are provided with malleable iron lugs and long upset threads to permit easy adjustment. Write today for catalog and price list.

Own a Water System

No farm or dairy is compiete without a water tank. Plenty of water is just as essential as plenty of feed. A **Pacific Redwood Tank** will insure your water supply, add to your profits and increase the value of your property.

Pacific tanks are fitted with patent non-shrinking feature that absolutely prevents leakage. They are built right and possess the everlasting qualities of Redwood. You can easily own one. Send for booklet and price list.

THE "W-W" (Hammer Principle)

ALL PURPOSE FEED GRINDER

The "W-W" can "beat it"
—You can't beat the "W-W"

"The proper place to mix feed for stock is outside not inside the stomach."

THE proper, practical, principle to employ is the hammer process.

W-W Grinders are constructed on an entirely original principle. Hay, grain—any kind of feed, is reduced to any degree of fineness by a beating process.

Nails, stones and other hard substances do not injure the mill.

The square faced hammer while pulverizing the feed, throws out the nails, bolts or other materials that might get into the mill in the feed

The W-W is an ALL PURPOSE Feed Grinder, practically indestructible, easy of operation and with greater capacities for smaller horse power than any machine offered.

It will successfully grind anything fed to stock in California. Is also used to pulverize fertilizers.

W-W mills are built in a wide range of sizes and types having capacities from 500 pounds to 8 tons per hour—a size for every feed. Write for a list of California and Arizona feeders who are using W-W Grinders, also book of letters of what they say.

It will pay for itself.

Berkshire Swine

August 23, W. M. Carruthers, Live Oak.

Wm. Briggs, who formerly maintained a large herd of Herefords in Texas, has purchased a ranch near Dixon and is planning to move his herd to this state. Briggs has joined the Pacific Coast Hereford Breeders' Association.

Verne Heath, formerly in charge of the Napa State Hospital herd of Holsteins, and who has been connected with a number of the leading dairy herds of the West, has taken over the management of the Bonita Farm near Lodi. The Bonita herd of Holsteins is regarded as one of the valuable collections of this state. Heath expects to put a large number of cows on test this fall.

W. F. Sandercock, who maintains a herd of Berkshires near Sacramento, calls attention to the fact that during the month of June California ranked second in the number of Berkshires transferred on the books of the American Berkshire Association. California breeders transferred 168 head while Pennsylvania breeders ranked first with 350 transfers, Massachusetts third with 153 and New York fourth with 149.

Henry Schumann-Heink, son of the famous singer, has purchased 80 acres of choice land in the Natomas district near Sacramento and expects to establish a top herd of pure bred Duroc-Jersey swine.

W. S. Guilford, one of the owners of the Butte City Ranch, Butte City, announces that the next sale will be held at the ranch April 17, 1920, at which time an offering will be made of Shorthorn cattle, Berkshire swine, Shropshire sheep and Shetland ponies.

Secretary Coombs of the Napa County Fair writes that the fair will be held at Napa October 2-5. Plans are being made to offer special inducements for a fine display of live stock.

At the McKee Brothers sale of Duroc-Jersey sows held at Versallles, Kentucky last month, 60 head averaged $369. Two gilts, one sired by Highland King Defender and one bred to that boar, sold for $1000 each. Highland King Defender is the sire of H. P. Slocum & Son's junior yearling herd boar, Uneeda McKee's Defender.

At the head of the Renwick herd of big type Poland-Chinas, Santa Barbara, is the 900 pound, 23 months' old boar El Profito, a line-bred Big Timm. This boar excels in both top and bottom lines, showing extreme spread of rib; his fine feeding quality is imparted to his get, and some of his best young daughters are to be kept as fixtures on the ranch. Three leading brood sows are Big Helen, daughter of Big Long Jumbo; Defender's Long Maid, a Pilot Defender sow; and Santa Barbara Beauty by Blue Valley Tecumseh. The last named sow farrowed 27 pigs within 13 months. A recent purchase is that of a Big Bob gilt bred to Buster's Model. She is from the noted Frazier herd of the Middle West. Miss Viola L. Renwick is owner of this fine herd and reports an excellent run of sales.

Only Bull Calves For Sale

Indio, Riverside County, ginned its first bale of cotton last week.

H. J. Show of Santa Barbara, purchased the first prize Ayrshire cow, Muna Rosewood, from the noted McFarland herd at the Liberty Fair. While at the fair this cow dropped a fine bull calf, Liberty Boy, sired by Robin Hood 32. This young bull is now coming of serviceable age. He fills the eye to perfection and may be seen at the home ranch.

E. E. Greenough of Merced reports sale to J. J. McMasters of Merced of the Jersey bull Brownie's Marquis which is a very promising youngster. Mr. Greenough has also purchased two granddaughters of the ex-world's record cow, Goldie's Nehalem Beauty and also the young show bull Fussy Fern's Noble 9th at the recent Reid's sale at Sacramento. These will be shown at the state fair.

Alex D. McCarty, owner of the Riverina herd of Poland-Chinas, has recently sold a boar to Samuel Smith of Hollister and one to Tallman & Hibbard of Oakdale. Both boars are by Kansas King. The Riverina herd has been strengthened by the purchase of a very high class sow from Williams Bros., Villisca, Iowa. She is sired by Big Fred, a son of Big Bob, and will be bred to King Jones Over, the boar that is making such favorable impression on all who see him. The Riverina herd will be seen at the fall fairs and advance reports suggest that it will receive its share of the prize money.

O. M. Plummer, general manager of the Pacific International Live Stock Exposition, Portland, writes that the new home of the show is fast nearing completion and will be ready 30 days before the show. It is expected that a number of the leading herds of this state will invade the Northwest after a share of the $65,000 prize money offered by the above show. The show will be held November 17-22.

The San Joaquin County Poland-China Breeders' Association will hold their first annual sale at Lodi instead of Stockton as announced in our last issue. The date claimed for the event is September 19, and it is planned to hold a second sale in February, probably the twentieth.

R. K. Walker of the Winsor Ranch, Bonita, writes that he has added the three-year-old boar, Orion's Giant, to their herd. This boar is one of the largest, if not the largest Duroc boar in the West. He was sired by Orion Cherry King, Jr., grand champion boar of 1916. He measures 82 inches from between the eyes to the root of tail, stands 40 inches and weighs 960 pounds. Mr. Walker also purchased a number of very high class sows, representing such desirable and popular bloodlines as Great Orion Sensation, Great Sensation, Pathfinder, Great Pathfinder, and Top Sensation. One of the sows cost $800 and the general average was $500. The Winsor herd will be seen at the fall fairs.

CALIFORNIA HAMPSHIRE BREEDERS ORGANIZE

At a meeting of Hampshire swine breeders held at Santa Barbara the morning of the Underhill sale the California Hampshire Swine Breeders' Association was formed. The new association starts with an initial membership of about 30 of the most prominent breeders. F. B. Gordon of Los Angeles was elected president; C. J. Gilbert, Lancaster, secretary; Francis T. Underhill, Santa Barbara, first vice-president; L. E. Denker, Saugus, second vice-president; H. H. Braly, Newbury Park, third vice-president; W. S. Morton, fourth vice-president, and F. J. Costello, fifth vice-president. The annual dues were fixed at $5.00 per year. The purpose of the new organization is to promote the interest of the breed in this state.

List of initial members follows:

E. C. Stone, Peoria, Illinois; R. C. Polard, Nehawka, Nebraska; F. V. Gordon, Los Angeles; Claire Rhodes, Pine Village, Indiana; King C. Gillette, Los Angeles; L. E. Lounsberg, Los Angeles; H. L. Langdon, Perris; F. A. Langdon, Perris; Fairbanks Ranch, Redlands; W. S. Morton, Gardena; H. C. Hayes, Los Angeles; C. E. Shattuck, Los Angeles; Ord L. Leachman, Sacramento; Tom M. Bodger, Gardena; Conejo Ranch, Newbury Park; H. H. Braly, Newbury Park; Francis T. Underhill, Santa Barbara; L. A. Denker, Saugus; F. J. Costello, San Francisco; C. H. Kellog, Saugus; Economy Stock Powders, San Francisco; Thos. T. Dinsmore, Santa Barbara; Dr. E. Avery Newton, Los Angeles; T. J. Hilte, Los Angeles; C. R. Thomas, Los Angeles; R. H. Whitten, San Francisco; Gordon H. True, San Francisco; J. I. Thompson, Davis; H. S. Hoard, Los Angeles; Rural Press, San Francisco; H. F. Sheldon, Santa Barbara; Jas. Marwick, Santa Barbara.

The first meeting of the association will be during the Los Angeles Live Stock Show, Tuesday, October 21.

A wide range of sizes to select from.

The ACME Cutter

The Combined Silo Filler, Hay Chopper and Alfalfa Meal Machine

VIBRATION IS REDUCED TO THE MINIMUM in the Acme by the 3-bearing cutter shaft and the rigid steel frame construction—a design found in no other machine.

Power requirements are proportionately reduced. This machine rightfully earns its reputation as the "DURABLE LIGHT-RUNNING ACME."

The spiral Cutting Knives produce that short, clean cut silage of uniform lengths so necessary for proper packing and best results. Don't buy any cutter until you fully investigate the ACME.

Write us, giving height of your silo, the horsepower available, and tons of hay fed per year. We will send our cutter catalog and quote you price and terms on the right size Acme.

De Laval Dairy Supply Co.

61 Beale St., San Francisco

Note:—The Acme Cutter will be on exhibition in the De Laval Booth at the State Fair at Sacramento

FREE

$3000 BOOK OF BARN PLANS

Going to build or remodel a barn? Then send for this book. 112 pages of the most practical barn plans ever published. Treats every phase of modern barn construction. Cost over $3,000 to compile. Yours free—for the asking.

AND WE WILL ALSO SEND YOU THE COMPLETE LOUDEN CATALOG of modern sanitary barn equipment. Send for these two valuable books today.

LOUDEN BALANCE GRAPPLE HAY FORK

Lifts an enormous load. Binds it tight. Drops it clean. Spreads it well in the mow. Leaves no litterings to be cleaned up with a pitchfork. Three or four fork-fulls clear the rack. PERFECTLY BALANCED, slender but strong, will not bend or break. A money-saver in haying time.

Bred Sow Sale in October

Butter and Cheese Scoring Contest

By S. L. Denning

The second scoring of the 1919 California Educational Butter and Cheese Scoring Contest conducted by the Dairy Industry Division, University Farm, was held at the Lucerne Cream and Butter Company at Hanford on August 2. In connection with the scoring there was held a buttermakers competitive judging contest and a creamerymen's meeting.

Thirteen samples of butter and two cheese were entered for scoring. T. J. Harris of San Francisco, C. L. Roadhouse and S. L. Denning of Davis were the judges. H. Beck of the Danish Creamery, Fresno, received 94, the highest commercial score. B. A. Walters of the Hooper Creamery Company, San Francisco, received 96¾, the highest score, when the commercial and composition scores were averaged. H. C. Watson of the Watson Cheese Factory, McArthur, received 92, the highest score on Cheddar cheese.

J. A. Bauer of the Lucerne Cream and Butter Company, Hanford, won first place in the competitive butter judging and will be awarded a butter trier as a prize. E. B. Fulghum of California Central Creameries Company of Lemoore, was second, and F. A. Hayes of the Los Angeles Creamery Company of Hanford, third.

The butter entries which had commercial score of 90 or above are:

H. Beck, Danish Creamery, 94; B. A. Walters, Hooper Creamery Company, 93½; N. Nyborg, Milk Producers Association of Central California, 93; A. Wirz, Hollister, 93; J. A. Bauer, Lucerne Cream & Butter Company 92½; C. A. Johnson, Bodega, 92½; Fred Deter, Montague, 92; V. Simonsen, San Joaquin Valley Milk Producers Association, 92; W. E. Eaton, University Farm, 91½; J. A. Potts, Orland Cheese & Butter Company, 91; H. J. Wolf, Crystal Cream & Butter Company, 91; C. A. Holm, Moss Rose, 91; F. L. Bellows, Mutual Creamery Company, 90½.

On Cheddar cheese H. C. Watson, Watson Cheese Factory, had commercial score of 92; John Reber, Watson Cheese Factory, 91.

Butter of Good Quality

The entries of butter were of good quality. The average score of the 13 samples was 92.11 and 61.5 per cent scored 92 or above. No entries scored below 90. Most of tho entries had a clean, fresh flavor but some showed that old cream had been used and a few contained a neutralizer flavor. It seems to be a common practice with butter makers to neutralize to a low degree of acidity. Much harm can be done by neutralizing too far. If it is advisable to reduce the acidity of the cream before pasteurizing it should be done with considerable care and accuracy. It is a simple operation for the buttermaker to figure the amount of cream which he has in a vat and then make an acid test to determine the acidity. After knowing these two values he can then find the amount of alkali to add. He should prepare a table to show the amount of alkali necessary for certain weights of cream and acidities. Without the use of an acid test the process of standarizing the amount of acid is nothing more or less than guess work and uniform results cannot be expected.

The bodies of the entries were very good. A short time ago the California butter which had been shipped to the New York market was unfavorably criticized for being short grained and mealy. Few entries showed this condition. Without doubt the California buttermaker can eliminate this fault in his butter and satisfy the Eastern purchasers.

Only a small number of cheese were entered. This can probably be accounted for by the fact that only a small number of cheese factories are now operating. With an increase in price the output of cheese should be increased.

63 Hampshires Average $110

The public sale of 65 head of pure bred Hampshire sows from the Francis T. Underhill herd at Santa Barbara, California, on August 6, brought together a fairly representative crowd of swine growers interested in that particular breed. A scattering representation was even to be noted from distant parts of the state, and breeders of Poland-Chinas and Durocs were in evidence in the big gathering at the ring side.

Preceding the regular order of the day was the big noonday ox-roast. The tables were spread under the big trees that mark the ranch, and the score or more of ladies who flitted here and there added spice to the splendid service that marked every appointment of the noon hour.

This initial sale in California Hampshire swine circles is to be put down as an unqualified success. The prices did not run high, but every animal catalogued found a buyer at a fair price. Secretary Stone of the American Hampshire Swine Record Association, who conducted the sale, found much satisfaction in the distribution of this fine offering over so large a territory, and Mr. Underhill realized that he was sowing seed that should make for rich harvests in tho years to come.

Among those present were Professor Gordon H. True, manager of the San Francisco Livestock Show, and Charles R. Thomas, manager of the Los Angeles Live Stock Show. Both gave short talks at the opening of the sale, in which were set forth the fine prospects for full lines of exhibits at the coming fairs. Professor J. I. Thompson of the University Farm also spoke. E. C. Stone, who operates a sort of clearing house for the Hampshire breed of swine, paved the way for tho opening of the sale through a short but effective speech showing up the full line of virtues of the Hampshire hog as an economic pork producer.

Col. Ord L. Leachman of Sacramento cried the sale, making an average of $110.70 on the 63 head sold, with $300 as the top figure of the sale Following is a detailed list of the buyers and the prices paid:

Walter H. Dupee, Santee, $200.
C. G. Meiners, Ojal, $135.
H. F. Sheldon, Serena, $130.
C. E. Shattuck, Los Angeles $150
W. H. Dupee, $250.

J. L. Wilson, Jr., $65.
Miguel Erro, Santa Barbara, $8[illegible]
John Troup, $70.
T. W. Andrews, Los Angeles, $7[illegible]

Big Live Stock Shows

By Frank D. Tomson

The year 1919 marks the completion of plans of a broad nature in the organization of big live stock shows for the Pacific Coast country. No more constructive plans were ever matured than those which have resulted in the permanent organization of these great expositions, these educational institutions which have proven wherever they exist a most effective means of developing better methods in agriculture and more general prosperity as a direct result.

Five of these shows have been arranged in a convenient circuit beginning with the Live Stock Show at Los Angeles, October 18-26, and the California International Live Stock Show at San Francisco, November 1-8, followed by the Western Royal Show at Spokane, Washington, November 3-7, then the Northwest Live Stock Show at Lewiston, Idaho, November 9-14 and finally the Pacific International, Portland, Oregon, November 17-22.

The working out of this circuit and the placing of these shows on a permanent basis has required a vast financial investment and almost unlimited effort on the part of those who conceived the plan and foresaw its possibilities. The establishing of these shows will, as an inevitable result, compel higher live stock standards which are invariably the forerunner of stabilized agriculture and prosperity. The coming of pure-bred sires into this Western country has been the chief factor thus far in bringing about better methods of farming and ranching. But the work of improvement has barely begun. In the matter of a prosperous agriculture the West is today at the threshold merely, with a prospect for development and financial returns so extensive as to exceed all anticipations.

These great shows are but indicators of this development and they will serve as the most concrete evidence of progress. The success of these shows will have a definite relation to all lines of investment in whatever channel on the Pacific Slope. Since the coming of the railroads into the West no more important movement was ever conceived in the interests of Western progress than these live stock shows placed, as they now are, on a permanent foundation.

As a suggestion of the encouragement which these shows will offer there have been provided for prizes in the Shorthorn cattle classes alone approximately $20,000 for entries in the pure bred casses, both beef and milk, and in the steer classes, both pure breds and grades. This generous amount reflects the sentiment of those identified with the breed.

These shows should call forth exhibits from every section of the West. The prizes have been made sufficiently numerous to encourage entries from small herds and large herds alike. Every western breeder owes it to these shows and the efforts which their organizers have made to lend his support by exhibiting a few animals, for the exhibitor himself is the chief beneficiary. No better means has ever been provided for encouraging trade. In the judgment of those who have studied the live stock industry from all angles and for many years the placing of these shows on a permanent basis assures an increased activity in the favored West in improved live stock channels the like of which it has never heretofore experienced.

Horses Haul Cheaply

"It costs Wilson & Company approximately twice as much per ton to make deliveries in the Chicago territory with trucks as with horse-drawn vehicles," is the statement in the Breeders Gazette of W. J. Suor, superintendent of transportation for Wilson & Company of Chicago. "Figures taken from the books of Wilson & Company show that it cost us in the month of March 25 cents per hundredweight to deliver our products by use of two-ton trucks, 13.3 cents per hundredweight by use of one-horse wagons, 7.9 cents per hundredweight by use of two-horse wagons, and 5.9 cents per hundredweight by use of four-horse wagons."

"The trucks referred to are of two-ton capacity. They are geared at 30 miles an hour. They cost $2200 each. Sixteen of them are used to deliver packing-house products in the Chicago suburbs bounded by Waukegan, West Chicago and Gary. One extra truck is used for replacement purposes. It replaces a different truck every day, so that one truck is overhauled every 16 days. This system is found to lengthen the truck's life by two years. The cost of delivery will be five cents per hundredweight higher this year than a year ago, because the trucks are a year older and require more repairs, tires, and so on.

"The Wilson delivery teams weigh from 3200 to 3500 pounds. They journey to the loop with more than two tons to the load. They may be loaded up to four and one-half tons, or more than twice as much as the trucks will carry. An overloaded truck soon goes to pieces; an overloaded team will struggle along for a while and the owner is out only an extra handful of oats. A single horse will haul easily 4000 pounds, which is the capacity load for one of the trucks in question. It costs us about $19 25 per head per month to feed our horses. They get 19 pounds of best timothy hay, costing $31 per ton, per day, and 17½ pounds of best white oats, costing 70 cents per bushel.

"I am not interested in the horse business. All I am interested in is efficient delivery. The figures which I present tell their own story. We could no more do without the truck to deliver our products within a radius of 30 miles than we could do without teams to do our work close in, within a radius of ten miles of our plant. And the figures will show at what comparisons in cost of delivery The horse deserves a square deal, and is going to get it eventually."—Idaho News Letter.

EXPERIMENTS SHOW CASH VALUE OF CORN SILAGE

From experiments with steers conducted by G. E. Morton and T. E. Leiper of the Colorado experiment station, the following table was made and gives the value of corn silage per ton when fed with barley and alfalfa, as indicated by these experiments, when barley and alfalfa cost varying amounts.

When Alfalfa costs per ton	When Barley costs per cwt. $1.75	$2.75	$3.25
	Value of Corn Silage per ton		
$10.00	$5.21	$6.49	$7.13
11.00	5.51	6.79	7.43
12.00	5.80	7.08	7.72
13.00	6.10	7.38	8.02
14.00	6.40	7.68	8.32
15.00	6.70	7.98	8.62
16.00	6.99	8.27	8.91
17.00	7.29	8.57	9.21
18.00	7.59	8.87	9.51
19.00	7.88	9.16	9.80
20.00	8.18	9.46	10.10

For example, when alfalfa is selling at $20.00 per ton and barley at $2.75 then corn silage is worth approximately $9.46 per ton.

TAHOE FOREST AREA REDUCED

Approximately 49,239 acres has been eliminated from the Tahoe national forest in California and Nevada. The eliminated lands have no value for national forest purposes. More than 15,000 acres eliminated are located on the steep canyon slope of the North Fork of the American River. Another large tract of approximately 10,000 acres lies along both sides of Yuba River, and much of the land is on the steep canyon walls of the river. About two-thirds of this tract has passed into private ownership under the mining laws. The remainder of the lands excluded are in smaller scattered tracts.

Pork Production

By actual test pure Hawaiian Cane

MOLASSES

will increase pork production approximately five-tenths pounds daily over a barley and tankage feed, yet it sells for less than half the price. Do you know of any other feed that will do this at any price?
Why not get all the profits out of your hogs?
Write us for full particulars.

W. H. YOUNG COMPANY
58 Sutter Street San Francisco

WHIZ---BANG

A real big type Poland-China boar by Forrest View Bob by Caldwell's Big Bob. Bred big. Is big. Two litter mates now for sale at a reasonable price. His pigs a little later. Write for price and description.

J. H. Cook Paradise, Calif.

Long Jumbo and Yate's Big Orphan

have sired some wonderfully fine pigs. Big type Poland-Chinas by these two boars for sale at a reasonable price. Write immediately for full description. Fully guaranteed to satisfy.

HOGS

CASTLEVIEW
Giant Type Berkshires.

We are booking orders for spring pigs from Grand Champion sows and sired by Mayfield Rookwood, sire of Champion barrow at 1919 Western Berkshire Congress.

Castleview Ranch, Santa Rosa, California.

GRAND NATIONAL CHAMPION
Baron Duke 2d1st, 200001
Do you realize this is the only opportunity you have ever had on this Coast to secure the pigs of a Grand National Champion? Duke is breeding them long and thick. He is getting old and may die any time. You are started right if you get his pigs. A very good April boar pig sired by Duke and from a half sister of Rincons Rival 2nd, cholera immune, $35.00. Sandercock Land Co., in charge of Natomas Sales, 23 Montgomery Street, San Francisco, California.

Wondercrest, California's leading Poland-China sire—big himself, bred big and his pigs show the same qualities. His dam was Giantess Wonder, his sire Big Jones—both big, both winners—a combination of the greatest blood of the breed. Breed big type Polands. Start right by using this blood. Write for special offer. A liberal consignment made to the Tulare Poland-China Associated Breeders' sale held Tulare, October 21st. OXBONE Herd Poland-Chinas, Tipton, California.

"Sapphire" Swine (Blue Hogs) actually blue in color. The Blue Hogs are no longer an experiment. We have bred them successfully for twelve years before offering any for sale. They mature quickly, grow very large and the females are the most prolific breeders on earth. Write for information. Mention this paper. The Blue Hog Breeding Co., Wilmington, Mass.

Billiken Chester Whites; July offering none; August offering consists of 8 boars and 5 sow pigs, this spring farrow. All are now cholera immune. Will have a full exhibit at the State Fair this year and will show some good ones. Call around and look them over. I'll be there to do business. C. B. Cunningham, Mills, California.

Grape Wild Farm Berkshires—Guernseys—spring pigs sired by Big Leader and Grape Wild Farm Leader. Guernsey bull up to 8 months old. A. B. Humphrey, Prop., Escalon, California.

Rancho Del Sur Durocs—A few good growthy fall boars sired by Orion's King Gano and California Orion Cherry King. Satisfaction guaranteed. Donald H. Graham, Box 569, Lancaster, California.

I Have a Few Registered Duroc-Jersey boars farrowed February 15, 1919, sired by P. & L. Great Model No. 233141. If you are looking for something good see them. F. C. Richey, Jr., R. F. D., Box 120, Hemet, California.

The Best in the West—California Gertsdale and Presidents Equal are my herd sires. Fall and spring boars now ready to move; each one a corker. Dr. J. A. Crawshaw, Hanford, California.

Duroc-Jerseys at Ireland, home of Cherry Volunteer II and Ireland's Joe Orion. Ranch at Owensmouth, California, City Office, 1219 Brockman Building, Los Angeles, California.

A Few Poland-China Boars ready for light service by King's Big Bone Leader and President. Priced right. Full particulars on request. John M. Bernstein, Hanford, California.

Duroc-Jerseys — We won more money on Durocs at the State Fair than any other exhibitor. Why not get some of this winning stock? June Acres Stock Farm, Davis, California.

Pathfinder and King's Col. Stock, immune. Weanlings $25 each. Bred gilts and service boars. Derryfield Farm, Capital National Bank Bldg., Sacramento, California.

Have Sold All the Pigs advertised recently. Will have fine pigs from spring litters for sale in June. Fine Shropshire ram lambs, pure bred, for sale. J. J. Prendergast, Redlands, California.

FERTILIZER

For Sale—Chicken manure in carloads. Cheapest and best fertilizer. MacDonald Sons. Phone 101, Watsonville.

Farmers Throughout California Are Using Trucks

—to transport valuable crops to market,
—to transport livestock in buying and selling,
—to transport implements from farm to farm or to repair shop and to work,
—to haul fertilizers, seed grains, milk, nursery stock, building materials

On some ranches employing several men, a truck is used to take them to work and is sent for them. During the day the same truck is used for hauling.

While the value of a truck to a farmer differs somewhat with the nature of the enterprises in which he is engaged, it has been determined very clearly that trucks used in farming have added greatly to farm profits by cutting farm expenses. The speed with which tonnage can be hauled—crops transported and material secured, cuts deeply into high wage expense and many farmer owners find it possible to easily earn $25 per day with a $2,000 or $3,000 truck investment. There is more work for trucks in California than the present truck tonnage can handle.

Kissel trucks are made in ¾, 1½, 2, 3½ and 5 ton truck models and made with extra loading space. Gear ratios are made to suit the farmer's needs.

AYRSHIRES

At Public Auction

The Preston School of Industry, Ione, California, will disperse at public sale its entire herd of registered Ayrshires, consisting of approximately 60 cows, heifers, and bulls.

Tuesday, September 16, 1919
State Fair Grounds, Sacramento, Calif.

This herd was established with animals selected from some of the best known herds of the United States and Canada, and in this dispersal buyers will have an opportunity not before afforded in the west for the purchase of registered Ayrshires at public sale.

See the School Exhibit at the State Fair

SILO PACKER

We recently saw an illustration of a "silo packer" which seemed to be at least novel, and we imagine might be most effective in increasing silo capacity. It consists of a roller operated by light weight gas engine which is placed inside the silo and operates while it is being filled. It is gauged so as to continually go round and round, compressing the freshly cut silage so as to make better preservation and at the same time increase the capacity of the silo by one-third. In these days of high priced labor it beats tramping.

NATIONAL GRANGE MEETING

The 53rd annual session of the National Grange will be held at Grand Rapids, Michigan, beginning November 12, 1919. All officers are to be elected, and a large amount of nationally important business will be before the meeting which may last two weeks. Arrangements have been perfected for headquarters at the Hotel Pantalind, by the national executive committee, S. J. Lowell, chairman; Oliver Wilson, national master; Thomas C. Atkeson, and W. N. Cady.

RETAIL PRICES ON FERTILIZER VARY 100 PER CENT

The striking disclosure is made in figures gathered by the United States department of agriculture that retail prices of fertilizer materials paid by farmers at the present time very considerably as between states and regions and widely as between counties in the same states. In some instances the variation is more than 100 per cent. For instance, a farmer in one county in Tennessee is paying $81 a ton and in another county $150 a ton for nitrate of soda, and in Georgia a farmer is paying $17.50 in one county and $49.70 in another for acid phosphate.

AUSTRALIA CONTINUES WHEAT GUARANTEE

Australia has decided to continue the wheat pooling system for at least another year and will guarantee farmers $1.05 per bushel, less freight.

A weed is any plant in the wrong place. Vegetables too close together are as injurious to each other as weeds. Thin them out before they are large enough to crowd.

A cup of fine rich tea, full of the real tea-flavor, costs less than a cup of common tea—a pound makes so many more cups.

Now this is either so or not so; and you can prove it at our expense.

Get Schilling Tea at your grocer's. Serve it a half-dozen times. If you don't find it's the fine economical tea we say it is, tell your grocer "I want my money back" and then use the rest of the tea.

There are four flavors of Schilling Tea—Japan, Ceylon-India, Oolong, English Breakfast. All one quality. In parchmyn-lined moisture-proof packages. At grocers everywhere.

A Schilling & Co San Francisco

Sulphur

It has been proven and so recommended by the University of California that if you sulphur your grape vines and orchards SIX times they will not be affected by MILDEW or RED SPIDERS.

ANCHOR Brand Velvet Flowers of sulphur, also EAGLE Brand, Fleur de Soufre, packed in double sacks, are the fluffiest and PUREST sulphurs that money can buy; the best for vineyards; the best for bleaching purposes, LEAVING NO ASH.

VENTILATED Sublimed Sulphur—Impalpable Powder, 100 per cent pure, in double sacks, for Dry Dusting and making Paste—(Atomic Sulphur).

For LIME-SULPHUR SOLUTION, use our DIAMOND "S" BRAND REFINED FLOUR SULPHUR. We can furnish you this sulphur at such a low price that it would pay you to mix your own solution and net you a profit equal to the amount paid out for labor in spraying your orchard, even if you pay your men $4 per day for making the solution and applying same.

To create additional available plant food, drill into the soil 100 to 400 pounds per acre DIAMOND "S" BRAND POWDERED SULPHUR. 100 per cent pure. This has increased various crops up to 500 per cent.

Also PREPARED DRY DUSTING MATERIALS, Tobacco Dust, Dry Bordeaux, Dusting Sulphur Mixtures, etc.

And "Anchor" Brand Standard LIME-SULPHUR SOLUTION 33 DEGREES BE., Sulphur Paste, Nicotine, Blackleaf 40, etc. Fungicides and Insecticides.

Carried in stock and mixed to order.

San Francisco Sulphur Co.

524 California St. San Francisco, Calif.

We are equipped to make immediate shipments. Send for "ILLUSTRATED BOOKLET," also booklet "NEW USES FOR SULPHUR", Price-list, and Samples.

Please state for what purpose you use the sulphur, quantity needed, and date of shipment preferred. Telephone Kearny 871.

MY MUVVER

By Ellen M. Ramsay

Oh! the boo-fullest lady in all of our town,
In her old kitchen apron or new Sunday gown,
Is my muvver who lives with my daddy and me.
She's as sweet and as pretty as pretty can be;

'Cause her cheeks are so pink, and her eyes are so blue,
And her mouth was just made to be kissing boys, to.
When at dark in my crib-bed she tucks me so snug,
Then she gives me the whoppingest kiss and big hug.

In the night onee I had the most awfullest dream.
It woke me all up and I started to scream,
Till I saw right beside me a something all white,
And my tongue, it just felt like it freezed up with fright.

'Cause Jane said the angels watched over my bed,
And I don't know no angels and I was afraid.
But the white thing said, "Little Boy," and made me 'seover
It weren't no old angel but just my dear muvver.

ON THE EDGE OF THE WORLD

"MUST you go now, Velverette? It is hard that we cannot be together but we mustn't ask too much of Providence!" Mrs. Warren glanced contentedly at Velverette. "There are not many in this sad old world as happy and blessed as we. And tomorrow is Thanksgiving! We must have a feast, Velverette!"

Velverette stooped, securing the straps of her lunch box. Like her mother, she was frail and fading. Her name was a touch of Fate's irony. Had she ever been gay and vivid like the patch of bloom in memory's garden? Long ago she had exchanged Eden for factory smoke and city pavements. She had sacrificed youth and love to make Mother comfortable.

"Yes, Ma, we are very happy and tomorrow we'll have our little spread and be merry together. The shop closes for the day. Don't be lonesome now and don't let anything bother you."

"What could bother me?" the old lady retorted. "Haven'tyou been my sea-wall since your father died? Run along and don't be too gay and pretty there at the shop! What if things happened as in stories? What if one of the bosses should notice you?"

"Nonsense!" laughed Velverette. "At my age? Goodby, Mother!"

In the entry her hands came together convulsively as she smothered a hysterical laugh. "Poor Ma;" she whispered. "God take care of both of us if one of the bosses should 'notice' me!" Her hands dropped and she stepped forth with the swing of sweet sixteen.

Thanksgiving! Had Velverette, behind those big glass doors which caged her from the street, much for which to be thankful? For 20 years at these portals she had surrendered her freedom.

There was a subdued stir in the alcove where she stopped to register. Her thin fingers nervously fluffed up the gray locks at her temples as she donned the smile she was expected to wear. Patty Prince, cash, brushed past, hesitated and turned back for word of greeting. There was not a girl on the third floor who did not dearly love Number Four, of the Suits Department.

"It's going to be a crush for the special sales, isn't it?" she whispered. "Say, Miss Warren, do you know—but of course you do!" She suddenly slid on her way, smiling back half-heartedly at her friend.

Number Four went to her alcove on the third floor and began to drape dummies, whisking away imaginary specks of dust. While so occupied she became conscious of the presence of a young girl, pretty and smartly dressed, whose lost, detached expression appealed for smypathy. The girl advanced, seeing herself observed. "You are Miss Warren, are you not?" she asked. "Mr. Travers ordered me to report here."

Mr. Travers was the manager. "I am Miss Warren," Velverette nodded. "What does Mr. Travers wish?"

"That you shall start me in my new work I'm Manda Stuart, promoted from the first floor. I feel sure I can sell lots of these pretty suits when I take charge. Haven't you liked it up here, Miss Warren? Mr. Travers said——"

Miss Warren was not listening closely. Something was pounding against her hand, gripped closely at her breast. She had made blunders, she was not so brisk nor attractive, so able to persuade madam she was lovely in blue, when she knew madam looked hideous. She had been sick a time or two. Tonight she would be transferred to some less important station or given notice. This was the pretty little Manda Stuart who was winning her way as a good sales woman. Somebody had praised the girl just last week. She had a trim little figure, a coaxing way, bubbling vitality. She pleased customers.

Miss Warren's hand fell away from her pounding heart and went up mechanically to find her gray hair. Then she said in the voice of 20 years of trained service: "Very well, Miss Stuart. You may hang your wraps in there for the present. While we are idle I will show you. This tag, now——"

The usual Special overtook them presently. People crossly mussed and tried on garments, retreating without purchase or apology.

(Continued Next Week)

TAKE OUT STAINS BEFORE LAUNDERING

Directions for taking out the more common stains from clothing, which were promised last week, were held over because of special pest fighting number, the space being given to hints for besting the ant, the moth, and all the company of insect annoyances with which the housekeeper has to deal.

One caution bear in mind, the stains are more easily removed before laundering; sometimes it is almost impossible to get them out after they have passed through hot suds or boiling.

To take out blood stains, wash out when fresh with naptha soap and lukewarm water or cover with a paste of raw starch.

Candle wax. Blotting paper and a hot iron.

Coffee. Pour boiling water through the stain; if old, soak first in cold water containing a little borax.

Chocolate, cocoa, and tea. Borax and cold water.

Dye (fading from one fabric to another. Put the article into a pan of boiling water and boil until color has about disappeared, bleaching in the sun if necessary.

Fruit. Spread the stained portion over a bowl and pour boiling water from a teakettle with force. Peach stains may be removed by soaking in Javelle water, rinsing thoroughly afterwards. Formula for making Javelle water is given in answer to query in this department on bleaching flour sacks.

Grass. For wool and silk, cover the spot with talcum powder, magnesia, or French chalk, warming slightly. Brush the powder off and apply again, if necessary. Or put between blotting paper and apply a hot iron. On a fabric not likely to spot, such as serge, gasoline may be used. Make a thick pad of cloth and lay the spot over it. Apply the gasoline with a piece of the same material or color, at least. Rub with a circular motion between the fingers from the outside of the circle inward. For fabrics of delicate color likely to show a "ring" make a paste of ether and magnesia or French chalk and apply to the spot, brushing off when dry.

Ink. Fill a bowl half full of water and lay the stained portion over it. With a medicine dropper or teaspoon drop on a little Oxalic solution diluted half with water. Follow almost at once with a drop of ammonia, dip into the water, rub gently with a circular motion between the hands. Repeat, using acid and ammonia alternately, until stain becomes very faint or disappears. Javelle water will remove the last tinge of color more safely than acid. Rinse in ammonia water.

Iodine. Wash with naptha soap when fresh or soak in ether, if stain is old. Jevelle water may be used for old stains difficult to remove.

Iron rust. Cover the spot with lemon juice, sprinkling salt over it, and leave in strong sunlight, until it disappears. Wash carefully. Another method is to spread the fabric over a bowl of water containing one teaspoon borax. Drop dilute hydrochloric acid on the spot, dip in the borax water and repeat.

Mildew. Mildew may be removed

We are always in the Market for Lemon Culls

by soaking in dilute Javelle water, several hours, if necessary, or a paste of raw starch, a little soap solution, lemon and salt may be spread over the stains for a day or two.

Paint. Add turpentine or gasoline until the pigment is set free by the drying oil dissolving.

Pitch. Turpentine. If any "ring" results after careful application over a pad, remove with hot iron and blotting paper.

Wagon grease. Rub lard on the stain and wash with soap and water.

LEMON HINTS

By Minnie Calista Childs

Lemon Ice

Make same as lemonade, adding well beaten white of an egg to each quart, freeze and serve with sunshine cake or any light sponge cake. A cooling and delicious dessert.

Frosting

Juice and grated rind of one lemon, add powdered sugar enough to make a smooth paste that will not run; beat well, add small lump of butter.

Garnishing

Thin slices of lemon and orange for vegetable or fruit salads.

Fruit Salad

Three oranges, juice of one lemon, two bananas, or peaches, plums or pears may be substituted for bananas. Sprinkle well with cup of sugar. Add two tablespoons of gelatine dissolved in two cups water. More or less sugar may be used according to the acidity of fruit.

Always serve lemon with fish.

Half a lemon in hot water for that tired feeling.

Salad Dressing

For all kinds of salad dressing use lemon juice, instead of vinegar.

To Make Jelly Jell

If fruit is a little too ripe to jelly well, add two tablespoons of lemon juice to a quart of fruit juice.

Quince Conserve with Lemon

To one quart of thinly sliced quince, add one thinly sliced lemon. Let cook with two and one-half cups of sugar, with water to cover until clear. Use lemons for health.

SOME PICKLE RECIPES

Many requests have been coming to the Cultivator for recipes for cucumber pickles. A dill recipe was given in issue of August 2 under "Queries." Here is one for putting up in brime for later adding of vinegar:

Cucumbers in Brine

To one gallon cucumbers add one cup salt and cover with boiling water. Let stand 24 hours, pour off brine, boil and pour back over pickles. Let stand 24 hours and repeat; repeat third time. These will keep perfectly in barrel or stone jar if weighted board forces all cucumbers under the brine. If desired they may be put in jars and scalded without further treatment. Of course if weaker brine is used it might be necessary to sterilize after putting in jars. When wanted for pickles these cucumbers may be taken from brine, washed and covered with boiling water and vinegar, equal parts, with alum size of hickory nut. In about six hours the pickles will be firm and ready for use.

Sweet Cucumber Pickles

Soak cucumbers in brine two weeks; drain and if large slice lengthwise. Boil 20 minutes in syrup of six pounds sugar (or substitute), four quarts vinegar. Keep in tightly covered crock.

Cucumber Relish

Not boiled—twelve large cucumbers, four large green peppers, four large onions, one cup horseradish, one cup sugar, one-half cup salt, one teaspoon mustard seed, one teaspoon celery seed, cold vinegar. Remove skins and seeds from cucumbers; then put all the vegetables through the food chopper. Add the salt, mix well and let it stand overnight. In the morning drain, and add horseradish which has been put through the food chopper, and the other ingredients. Mix all thoroughly with cold vinegar, pack tightly in glass jars, and seal at once.

Green Pumpkin Pickles

Take one pumpkin that has not begun to turn, pare and cut into strips. Put into a crock a layer of pumpkin, sprinkle with salt and continue in this way until the crock is full or the pumpkin used. Cover with vinegar and let stand overnight. In the morning pour off the liquid and throw it away. Make a pickle vinegar and cook the pumpkin in it until tender, then put it into a crock and cover and set away for a few weeks before it is ready to use.

Pickled Onions

Take uniform, medium-sized onions, peel, put into boiling water and cook until quite clear. Take out, dry thoroughly between cloths and pack them into glass jars. Take good vinegar, put into it several pieces of ginger, some whole pepper, bring to a boil, and when cold pour over the onions and seal the jars.

Small Melon Pickles

Select green muskmelons about the size of an egg; prick well and place in strong brine for three days. Soak until fresh, wipe dry, place in jars and pour over them hot spiced vinegar, seal and keep in a cool place.

Green Pepper Mangoes

Take large green peppers which are sound and firm, and a few red ones to add to the appearance; cut off the tops, extract the seeds; put in strong brine and soak for 24 hours. Drain, wipe dry and stuff with the following: Chop cabbage, green tomatoes and several onions rather fine; scald and drain; add salt, white mustard seed and a little ground cloves, mix well, stuff the peppers, sew on the tops, and cover with strong, hot vinegar containing one cup of brown sugar; reheat the vinegar and scald for four mornings, and seal up.

HOUSEHOLD QUERIES

Bleaching Flour Sacks

Sometime ago you published articles stating uses of flour sacks. I would be glad to know how these subscribers took the lettering off, and bleached them for such uses.

The ordinary boiling and bleaching in the sun will take out most of the color. For quicker results soaking in a dilute solution of Javelle water will take out stronger color. The Javelle water is made by dissolving one pound washing soda in one quart boiling water in enamel pan and one-half pound chloride of lime in two quarts cold water. After the lime water has settled, pour off the liquid into the soda solution, bottle tightly and keep in dark place. After using dilute solution of this (strength can only be determined by testing on one piece) rinse cloths thoroughly. Some of the stronger washing powders will also take out the color.

If any of our readers have found a better or easier method the Cultivator will be glad to publish and give credit on subscription for suggestions.

SPINACH LOAF

Spinach shrinks so much in cooking that it takes a large quantity to serve a family. If the supply is scanty, try serving it in the form of a loaf.

Two cups chopped cooked spinach, four cups boiled rice, one cup white sauce, one red sweet pepper.

Make a thick white sauce from one cup skim milk, three tablespoons flour, three tablespoons fat, and one teaspoon salt. Melt fat and mix with flour, add to milk, and stir over fire until thick. Mix with rice, chopped spinach and pepper. Form into a loaf and bake 20 to 30 minutes.

ESSEX MOTORS DETROIT

Note How Everyone

It Has Become a Familiar Car on Nearly Every Highway

Hails the Essex

Essex owners report the satisfaction they experience at the way people speak of their cars. It increases their pride of ownership. Motorists and even boys on the street hail the Essex with some such greeting as "There is an Essex."

Curiosity in the car that possesses quality and performance at moderate cost and without the expense and weight of such cars as formerly were the only ones that possessed those advantages, has given way to openly voiced admiration.

Essex Owners Are Its Salesmen

At first it was what people who had seen the Essex said about it that led to its popularity.

Now owners—and there are thousands of them—are endorsing it on every hand. People stop Essex owners to inquire about their car. The answer is unanimous. When asked as to its performance they make no reservations. Admiration of its riding qualities is never lacking.

Every wanted quality in an automobile seems to have been met in the Essex. Ask the first Essex owner you meet.

Essex Performance Is Always Mentioned

There is no uncertainty to the owner as to Essex performance. Drivers know positively that their cars will meet any acceleration or endurance test they impose.

They know they can match the performance of whatever car they encounter.

There are now enough Essex cars on the road to permit you to note their performance. They are always in the lead when quick acceleration is desirable. They hold their own on the road against cars regarded as the fastest. They keep going and require little attention.

The repair shop is no place to learn about the Essex for it has little need to know the repairman.

Won't you make some inquiry about the Essex? You will find it interesting and convincing.

Harvest Beans
with a
DAVENPORT
RIDING BEAN HARVESTER

Our strongly constructed two-row Riding Bean Harvester is the result of many years experience in California bean fields. Blades are 6 inches wide of plow steel, frame very strongly braced. Both lumber and steel are going up. The next lot manufactured will cost more. Buy early.

Davenport Implement Co.
1032 East First St., Los Angeles

Preserve Your Strength by Attaching a
NATIONAL BACK REST

To the seat of your tractor or farm machinery. It saves your back and you ride in comfort. The National Back Rest fits on nearly any seat no matter what style or shape. It can be quickly and easily attached without the use of tools. No screws or bolts. Will not slip off. Three dollars delivered. Some agency territory still open. Satisfaction guaranteed or money refunded.

Jorn Bldg., 57 Plaza Square, Orange, California

terms, Elbertas. Boxes 75@80.

Pears: Supplies heavy. Demand and movement moderate, market steady. Mostly full ripe stock. Sales direct to retailers—Bartletts, standard box. Few No. 1s mostly 2.50; No. 2s 1.25@1.50.

Sacramento: Demand and movement moderate, market steady. Bartletts, standard boxes, carloads f. o. b. usual terms, 2.50@2.75.

Plums: Cherry, 85@1.00; Clyman, 1.00 1.35; Simoni, 1.00@1.25; Santa Rosa, 1.00 @1.25.

Pineapples, doz., 2.00@5.00.

Raspberries: Ch., 14.00@15.00.

Strawberries: Ch., 10.00@14.00.

Watermelons, lb., 1@1½.

DRIED FRUITS

The California Prune and Apricot Growers, Inc., announce prices:

Apricots, Sunsweet Quality: Choice 25, extra choice 26, fancy 27, extra fancy 29, Fancy Moorparks 29, extra fancy Moorparks 32. Growers Brand Quality: Choice 24½, extra choice 25½, fancy 26½. First Quality: Standards 19, slabs 21.

Prunes, basis price: 20-30s (flat lb.) 22, 30-40s (basis) 16, 40-50s (basis) 14, 50-60s (basis) 12, 60-70s (basis) 11½, 70-80s (basis) 11, 80-90s (basis) 11, 90-100s 11, 100-120s (flat lb.) 8½, 120s and up (flat lb.) 7½. Growers' Brand ⅛ cent under these prices.

Peach prices for the 1919 crop were announced at Fresno, July 16, by the California Peach Growers Inc. The price list agreed upon by the directors and announced by General Salesmanager Sturtevant, follows:

Effective this date and until further notice, our prices f. o. b. our California factories, on 1919 crop dried peaches for the domestic and foreign trade: September, October, November shipment, sellers' option; guaranteed against our own decline until January 1, 1920, are as follows:

Standard yellows, 14¾; Muirs, 15.
Choice yellows, 15¼; Muirs, 15½.
Fancy yellows, 16½; Muirs, 17½.
Extra fancy yellows, 17¾; Muirs, 18¾.
Slabs yellows, 14½.

For "practically peeled" add 1½ cents per pound (any grade).

Prices above are all bulk basis.

For packing in: 50-pound or 25 kilos boxes add 1 cent per pound.

25-pound or 12½ kilos boxes, add 1¼ cents per pound.

10-pound boxes, add 2 cents per pound.

Blue ribbon peaches packed five-pound cartons, 12 per case, 12.00 per case.

Blue ribbon peaches packed two-pound cartons, 24 per case, 10.00 per case.

Bakers' special, "practically peeled," 16¾ per pound, bulk basis.

Figs: Wh. stand., 16; ch., 18½; ex. ch., 20; fy., 22½.

Apples: Ch. (in 50's), 21; ex. ch., (in 50's), 21½; fy., (in 50's), 23.

Pears: 1919 crop, stand., 20; ch., 22½; ex. ch., 23½; fy., 26.

NUTS

Almonds: The Exchange will make prices about September 10.

Prices named by outside buyers:

Nonuarell, 36, IXL 33, Ne Plus Ultra 32½, Peerless 29, Drake 26, Golden State 25, Languedoc 25, Hard Shell 20.

BEANS

Shippers quotations f. o. b. California: Bayo 6.50@6.75, Blackeye 5.75@6.00, Cranberry 7.00@7.50, Fava nominal, Garbanzo 11.25@12.00, Lima (f. o. b. So. Cal.) 12.00, Lima Henderson Bush 10.50@11.00, Pink 6.75@7.00, Red Kidney 11.50@12.00, Red Mexican 5.75@6.25, Tepary 3.00@3.50, White, large 7.50@7.75, White, small 7.75@8.00.

GRAIN AND FEEDS

Oats: Red feed, 2.95@3.05; black, 2.75 @3.00 per cental.

Corn: California yellow, 78.00@79.00 per ton. Egyptian 3.25@3.35; Milo maize, 3.10@3.20; Red 3.12½@3.17½.

Rye. 3.30@3.75.

Barley: Feed 3.10@3.15.

Wheat: Following are net weight prices for bulk grain, based on federal standards and grades at San Francisco Bay and Los Angeles terminals:

Hard Wheat—	Per Bushel	Per Cental
No. 1	2.20	3.66 1-3
No. 2	2.17	3.61 2-3
No. 3	2.13	3.55
Soft White—		
No. 1	2.18	3.63 1-3
No. 2	2.15	3.58 1-3
No. 3	2.11	3.51 2-3
Club and Sonora—		
No. 1	2.16	3.60
No. 2	2.13	3.55
No. 3	2.00	3.48 1-3

For sacked grain add nine cents per bushel of 60 pounds to above price. Deduction of three-fourths of a pound is made for weight of standard grain bags. Wheat grading under No. 3 and mixed or smutty wheat will be purchased according to merit.

Mill Feed (per ton): Bran 43.00@44.00; mill run, 42.00@43.00; Rolled barley, 52.00 @54.00. Linseed oil cake meal, nominal; cocoanut cake or meal, 41.00@42.00 per ton.

HAY

Under date of August 9, Scott, Magner & Miller says:

Receipts past week 2727 tons. The car situation throughout the country seems to be becoming more acute daily. Very few box cars being furnished for hay movements and although some gonodal cars are to be had yet as this equipment cannot be used to carry hay where tunnels have to be encountered this makes it difficult to ship hay to many points where it is required. They hay market has been well maintained and prices are about as quoted. Occasional shipments of fancy red oat or fancy wheat hay at times bringing in excess of our quotations. There has been a good demand for alfalfa especially throughout the country districts; this with the grinding of so much alfalfa hay into meal has had the effect of making a very firm market. There is no demand for straw.

We quote today wholesale prices in carload lots for old hay as appear from dealers' transfers upon the hay market—for prices to consumers charges of cartage, commission and handling expenses must be added according to conditions:

Fancy Wheat hay (light 5-wire bales) per ton	17.50@18.00
No. 1 Wheat or Wheat and Oat hay	15.00@17.00
No. 2 Wheat or Wheat and Oat hay	12.00@14.00
Choice Tame Oat hay	15.00@17.00
Other Tame Oat hay	12.00@14.00
Wild Oat hay	10.00@13.00
Barley hay	12.00@15.00
Alfalfa hay	17.00@21.00
Stock hay	9.00@11.00
No. 1 Barley straw, bale	.50@ .80

Citrus Markets

Los Angeles, August 13, 1919.

Shipments of Valencias are now running 100 cars daily or better. It becomes daily more apparent that Valencias will be cleaned up and at prices satisfactory to the grower. Good stock of every size is commanding ready sale, off sizes are being shaded somewhat in prices.

Weather conditions generally over the East have created good demand for lemons. Good stock has been commanding around $6.00 f. o. b. There are many sales under these figures. There are nearly 700 cars in storage which is materially above that of last year.

Shipments

Shipments of citrus fruits to date since November 1, 1918: Southern California: oranges, 30,015 cars, lemons, 8591, total 38,607. To same date last season; oranges, 12,846, lemons 4845, total 17,691. Central California this season; oranges, 4427, lemons 354, total 4781. To same date last season: oranges, 2539, lemons 115, total 2654. Northern California; oranges, 244, lemons 2, total 246. Last year same date; oranges, 203.

AT THE AUCTIONS

Pay For 12-20 Horsepower And Get Full 15-25

PUT the E-B 12-20, S. A. E. Rating, Model AA Tractor to work on your farm. Use it with the E-B 102 Tractor Plow. This is a combination that stands up to the hardest plowing with plenty of Power, Dependability, Economy, Ease of Handling, and E-B Service backed by capable, helpful dealers who know tractors.

THE E-B 102 TRACTOR PLOW
Plows More Acres Better With the Same Fuel
Easy to handle and easy to pull. E-B Quick Detachable Shares make furrows turn with less kerosene cost. Sharp-share plowing readily done when shares are so quickly applied and removed. Sharp shares keep channels of moisture circulation open—better soil conditions.

Surplus Power—because the 12-20 rating on the S. A. E. basis is the most conservative known, 25% extra power.

Dependability through 67 years of implement manufacture and 12 years of tractor building. Enclosed gears, high-grade materials and equipment, such as Hyatt Roller Bearings, K-W Magneto, high-grade Radiator, etc.

Economy—25% greater power with less weight. Kerosene motor cuts fuel cost.

Ease of Handling—E-B Auto Control. Ask your dealer for complete facts.

No-Yard House

By Jean A. Koethen

IT was a Cultivator reader that started me on my quest. He called up one evening to ask if I would not publish the measurements of the Corning house, an Eastern no-yard house which was much advertised some ten years ago. I reminded him of the Charles Weeks house which is being tried by some California poultrymen, but that would not do, the units were too small, and so I promised to find the dimensions of either the Corning house or some other just as good and better adapted, perhaps, to California conditions. It was this promise that sent me out one fine morning with my camera to find a no-yard house.

Hardly half an hour's trolley ride from my own door I found it, and in a place where I would not have thought of looking except for a chance inquiry of another poultryman.

When Mr. and Mrs. W. L. Hawes bought their home four years ago in one of the lively poultry communities of the San Fernando Valley and began to plan their chicken houses, they looked about for some means of eliminating the small, too often filthy yards which, while they do give hens a chance to sun themselves, provide no feed and little exercise. "If we can devise a house," they said, "which will let in air and sunshine and give reasonable room for exercise, we can do without yards." The outcome of this reasoning and the study which followed it was a system of no-yard houses which has now been in operation four years, and Mr. and Mrs Hawes are so far from abandoning it that they are planning as many more on their acre of ground next year.

Mr. Hawes' no-yard system consists of a series of units built into one long house. These units are entirely separated from each other by partitions and might be built singly or any number together according to the convenience of the owner. Mr. Hawes has nine, housing, when filled to capacity, from 1200 to 1300 hens. Four of these are now used for chicks, which are never out of doors from the day they go under the hovers till as old hens they are sent to market.

Each individual house or unit, is 16 feet wide and 24 feet long, six feet high in front and back and eight feet high at the ridge pole which is in the center. The front, which is toward the south, is entirely open, except for about 18 inches at the floor, but has an adjustable canvas curtain, on a frame which may be used in very hot or very stormy weather and which covers most of the front. In the rear is another curtain or door, extending three and one-half feet from the ground. "As hens are ordinarily yarded," said Mr. Hawes, "the owner is up against the proposition of providing each house with two yards, one of which is kept planted to green stuff, or changing the location of his houses when the ground becomes too full of filth for the health of the birds. This method is more simple, and the hens are perfectly healthy."

The chicks are brooded in four of the houses they will afterward occupy as layers, 1000 in each house. Mr Hawes keeps no male birds but buys his chicks by the thousand when they are a day old. They are brooded under eight-foot hovers similar to those used for electric brooders, but Mr. Hawes does not use electricity. His brooders are each heated by a gas burner, exactly like that in a range This burner is placed under the middle of the hover, surrounded by a fence of coarse wire to keep the chicks from the flame and covered with zinc. Until the chicks are brooder broke they are kept under the wooden hover by a strip of fine wire. Gradually, as they learn where to find warmth, they are allowed the freedom of the house As soon as they no longer need heat at night they find their places on the eaves, which may be removed in hot weather. This door is directly behind the roosts which are three feet from the floor and arranged one above the other on a steep slant. With the front entirely open and this rear door removed the hens get all the air there is on a hot day. They also get the sun in early morning and late afternoon and there are no dark corners for vermin to hide in. The floor is covered to the depth of a foot with coarse hillside sand, which is swept once in two weeks and entirely renewed every year. This frequent sweeping keeps the floor cleaner than an ordinary yard ever is, and once a year all hens have absolutely clean slatted roosts underneath the regular roosts, and without any teaching at all they go on when they are ready from the slats to the adult roosts.

The house is covered with tarred roofing paper, and fully equipped with hoppers, automatic drinking fountains and electric lights, and the hens are so comfortable in it, and so accustomed to indoor life that they cannot be coaxed out. When they have to be moved from one house to another it is sometimes necessary to carry them because they are unwilling to go outside.

Each unit is designed for 150 hens This allows a little less than the regulation three square feet per hen but as long as the house is kept perfectly clean small exercising space does not seem to matter.

Contented Hens
They are healthy and productive in spite of close confinement.

Poultry Queries---Conducted by Jean A. Koethen

Broody Hens

How can I keep my hens from trying to sit the second time?—Subscriber, Marysville.

I wish I knew how to keep these heavy hens from going broody too often. Some experts say it is a question of feeding, that feed that makes the hens too fat increases their desire to sit, but most poultrymen believe it is entirely a matter of breeding. If you breed from broody hens you will always have broody hens

If you pick out one or two hens that rarely or never go broody and hatch their eggs and theirs only, taking special care to make sure that your males are always the sons of non-sitters, you will find the broodiness in your flock decreasing. Several well known breeders are having good success in breeding the broodiness out of their Rhode Island Reds in this way.

Chicken Pox

Two years ago I bought 50 White Leghorn pullets and two weeks after they broke out with a terrible disease. Thought it was roup. Their eyes swelled shut, they sneezed and kept shaking their heads constantly with a rattling sound and had a very bad odor. Almost every pullet died. Tried to raise a few chicks last year but they took the same disease and died when a few weeks old. So this year I bought eggs to hatch and now have a nice bunch of chickens but some of them have a slight touch of that disease. They also gap quite often. I tried everything I knew of two years ago but to no avail. The chicks all eat heartily so far, but notice they have small blisters around eyes. I keep bluestone in drinking water and they have outside range all the time?—Subscriber, Glendora.

The small blisters around the eyes of your chickens this year show that they have chicken pox. Two years ago it was apparently roup, unless there were similar blisters, which you do not mention. Chicken pox and roup are so much alike in some of their symptoms that a number of experts consider them different forms of the same disease. Roup is characterized by all the symptoms of a bad cold, and these often occur in chicken pox. Now that you know you have had chicken pox in the flock you will need to disinfect very thoroughly or your birds will have it every year. Dr. Beach of the state university recommends only one treatment for chicken pox, that is, removing the scabs and touching the sores with tincture of iodine on the tip of a feather or small brush. To prevent the spread of the disease through the flock vaccination has been successfully practiced in many large flocks throughout the state. If you wish to vaccinate the birds that have not already contracted the disease, write immediately to Agricultural Experiment Station, University of California, Berkeley, California, asking for the number of doses you require and directions for using. I believe the cost is around ten cents per bird. In addition to the use of iodine on the affected birds you might try putting a little common sulphur in the dry mash, one pound of sulphur to 50 pounds of mash. Dr. Sanborn. recommends this treatment and this only. Whatever you do the disease will run its course, but treatment with either sulphur or iodine or both may keep it from becoming serious.

To Keep Off Lice

During the year I dust the straw in the nest boxes with a lice powder that permeates the egg shell and gives the eggs a flavor that is not at all pleasing and I will thank you to advise of an effective lice powder for nests that will not give the egg a distasteful flavor.—Subscriber, Reno, Nevada.

It is better to dust the hen than the straw in her nest, but the straw should all be removed from time to time and the inside of the nest box painted with a solution of crude carbolic acid in kerosene (one part carbolic to ten of kerosene) or with one of the many coal tar preparations (Carbolineum, Cresol, Zenoleum, etc.) Buhach insect powder sprinkled in the straw will not flavor the eggs, but neither will it keep the hen free from lice unless she is dusted with a good strong louse powder occasionally. Some experiment stations prefer blue ointment to powder for keeping their hens free from lice. This ointment can be purchased at any drug store but is too strong to use without diluting. Mix it with an equal quantity of vaseline, and taking a very little on the end of your finger rub it on each hen around the vent, where lice always breed. If you prefer a powder you might try Devil's Dust, which is very strong in tobacco. Used on the hen alone it will not flavor the eggs, and I doubt if it would flavor them if it were sprinkled in the nest.

STORRS EGG LAYING CONTEST

Storrs, Connecticut, August 1, 1919. Report for the Thirty-ninth Week ending July 31:

In the 39th week of the contest at Storrs the total production was 3314 or a yield of 47.3 per cent. This is an increase over the preceding week of 140 eggs. Again the White Leghorns continue to outlay the other breeds and walk off with the honors. Pen 57, owned by Kirkup Brothers, Mattituck, New York, Pen 92, owned by Rapp's Leghorn Farm, Atlantic Highlands, New York, and Pen 64 entered by P. G. Platt, Wallingford, Pennsylvania, tied for first place, with a production of 54 eggs each.

The following birds are the best individual layers in their respective variety:

Barred Rocks, West Hampton Beach, Connecticut, 169 eggs.

White Rocks, Hollis, New Haven, 176 eggs.

White Wyandottes, Langford, British Columbia, 170 eggs.

Rhode Island Reds, Bridgeton, Rhode Island, 187 eggs.

Rhode Island Whites, Southport, Connecticut, 164 eggs.

Black Rhinelanders, Burlingame, California, 155 eggs.

Blue Andalusian, Congus, New York, 138 eggs.

Oregon, Corvallis, Oregon, 155 eggs.

White Leghorn, South Glastonbury, Connecticut, 197 eggs.

August finds the poultryman doing two things to keep his flocks average in egg production. They are, first and foremost, spraying for mites, and at the last of the month culling out the early moulters and non-layers. The poultry mites, commonly called red mites, probably do more to cut down the egg yield in August than in any other month. During the day time they hide in the cracks and crevices under the roosts and in the nest, and at night when the hen is roosting they crawl out along the roost and on the hen. This parasite does its damage by sucking the blood and gives a characteristic odor to the house when present in large numbers. Hens and chickens show the effect by reducing the egg yield and acting dopy and pale about the head. Most of the coal tar disinfectants are effective to a certain extent, but carbolineum is by far the best. Usually one application a year is enough to rid the house of the pest.

The three best pens in each of the principal varieties are as follows:

Barred Plymouth Rocks

Jules F. Francais, 1512; Laurel Poultry Farm, 1471; Howard R. Sullivan, 1335.

White Wyandottes

Curtis L. Allen, 1331; W. Bradley, 1288; Merrythought Farm, 1149.

Rhode Island Reds

Laurel Hill Farm, 1448; Deer Brook Poultry Farm, 1321; Chas. H. Lane, 1304.

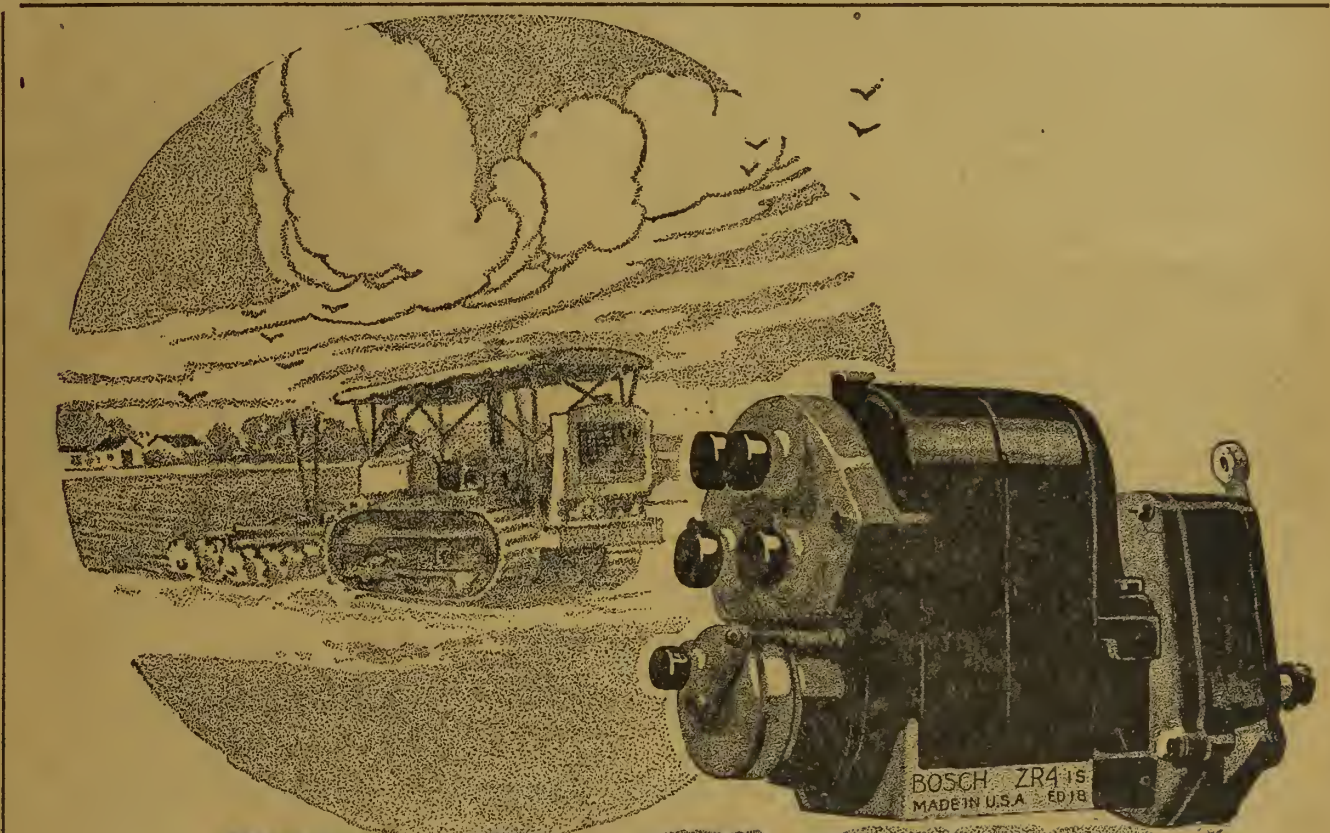
White Leghorns

Hilltop Poultry Yards, 1422; A. P. Robinson, 1363; James O. Lefevre, 1359.

Miscellaneous

Chickatawbut Farms (White Rocks), 1282; Pequot Poultry Farm (Rhode Island Whites), 1260; Albert T. Lenzen, 1101.

Make a business of selecting your hens as you would the selecting of good seed corn. Even a pen of four to ten good laying yearling hens, some that have been persistent layers, will start you right.



BOSCH

The Greatest Dual Farm Service

THERE is one combination that has stood supreme through years of Supreme Service—a properly designed gas engine and Bosch High Tension Magneto Ignition. Under the strain of farm service Magneto Ignition is a necessity. And no magneto can approach the performance record of the Bosch Magneto.

Rip Roaring Bosch Sparks on your tractor—gas engine—truck or automobile, will cut your operating costs, increase the dependability of your engine, and get more power from any fuel.

When you place your order for any piece of gas engine driven machinery be sure it's Bosch Magneto Equipt.

If your engine is not now Bosch Equipt, get in touch with the nearest Bosch Service Station, Distributor or Dealer. He has a Bosch Magneto ready for you now.

Fisk Cord Tires
An Investment in Tire Economy

ENDURANCE is the supreme test of tires—the thing that gives excess mileage and saves money.

Quality, experience and high manufacturing standards build into a tire things which insure long mileage—which rolls off the miles, thousand after thousand, without interruption and without inconvenience to the user.

Fisk Cord Tires are built just that way. Big, good looking, with extra tough tread, they give you easy riding, save gas and—most important of all—deliver the miles in excess of what you buy.

That saves you real money.

(Made also in Ribbed Tread)

"There is now a Fisk Tire for every motor vehicle that rolls"

Five Little Pigs Go to Market

What can a man Learn from Looking at a Tractor in a Tent

IF you have ever been to a tractor demonstration, you probably know the earnest way some salesmen have of taking you into a tent and pointing out all the fine points of the tractor they are trying to sell.

They will show you its engine and its wheels and its gears and its clutches, and tell you why they are better than those of any other tractor on the market.

Now, the intelligent farmer, when he goes to look at a tractor, wants to be shown by the tractor itself.

For eight years the G O Tractor has been showing farmers all over the country just what they wanted to know. It has shown them that it can do anything they want it to, and do it economically, and keep on doing it.

There is nothing "eye-filling" about the G O Tractor. It is a four-wheel, four-cylinder tractor—the simplest and most practical construction known. There is no loss of traction due to the shifting of weight to the wheels of the implement. Its pull increases as the traction increases, because the drawbar is free-swaying — not rigid — eliminating all side draft and making it safe on hills.

The G O driving mechanism is the biggest advance in tractor engineering which the industry has seen. It gives six speeds forward and six reverse—a right speed for plowing in any sort of soil; a right speed at the belt pulley for any kind of machine. It is so easily controlled that even a child can operate it. All gears are enclosed in a dust-proof oil bath, adding years to their life.

The facts about the G O Tractor are open to anyone who is looking for sound, common horse-sense—not features or talking points. You may be interested, also, in knowing more about the company behind the G O Tractor—its guarantee and its idea of what constitutes real service. A post card today will put you under no obligation.

For a Fall Cover Crop

By William M. Bristol

NEARLY every orchardist in California concedes that a cover crop is a good thing under certain conditions and circumstances.

Speaking for myself I may say that for many years I have been fully persuaded that an abundance of organic matter in the soil is the chief need of the fruit grower wherever his orchard happens to be.

I know there are some orchardists who say it is cheaper to buy organic matter than to grow it, and that may be true if they are near a source of supply and are also short of water for irrigation. In my own case, however, on the lofty East Highlands Mesa in San Bernardino County, these conditions are reversed. A long haul and a high lift are necessary to get any kind of fertilizer onto the land, but an abundance of water, pumped out of a prehistoric earthquake crack, the San Andreas rift, is available for the production of cover crops even in summer time.

I might as well confess that I have tried the whole list of plants recommended for soil rejuvenation, excepting perhaps, the pellionia rhodocanahiana and a few others whose names I could not pronounce or had forgotten when I reached the seed store. I have been all the way from Medicago sativa to Melilotus indica and alba. I have harbored Lathyrus silvestris and have given asylum to the whole lupin family. In short, in a quest covering a quarter of a century, it seems to me that I have forgiven and forgotten several families and orders of plants. I am now consorting with the common Black-eye bean, or pea, as it is sometimes called, presumably because it belongs to the so-called cow pea family.

A summer cover crop draws heavily upon the available nitrogen of the soil. Once I sowed an orchard to alfalfa. There was a good setting of oranges, and the packing house people reported that they were ten per cent heavier than the other oranges that came into the house, obviously because the alfalfa ate up some of the nitrogen the oranges would have used. To be sure the flavor and character of the fruit was fine, but the trees became quite yellow by fall, and I feared that next year's crop would be short if the alfalfa were not plowed under.

There has been but little objection to winter cover crops in the orchard; but there has been much clamor for something which would grow during the cooler months and be ready to turn under while the ground is yet soft from spring rains. No plant so far tried seems to meet this requirement. In experimenting last year with the Black-eye bean as a summer cover crop I stumbled upon the fall cover crop idea. My orchard is on a steep slope, rising 250 feet in the half mile of its extent. This means that the summer cloudburst, which comes about once in a half dozen years and causes serious damage in the twinkling of an eye, must always be borne in mind. If the orchard were all in cover crop there would be no danger from the cloudburst, just as there is no danger from the heavy winter rains because of the winter cover crop.

The facts I have recited will serve to show how I was led up to the idea of sowing a summer cover crop in alternate lands or spaces in the orchard. All the land is under cultivation when the trees are blooming and the fruit is setting in the spring. During the first half of June last year I sowed the Black-eyes in alternate lands, intending to sow melilotus indica in the other lands in the fall. Incidentally these alternate lands in Black-eyes would have safeguarded the whole orchard had the August cloudburst come. The first week in September the Black-eyes had matured most of their seed and were disked under, the ground being irrigated just before disking. In a few days there sprang up a thick and vigorous stand of young Black-eyes; and this crop of young Black-eyes at once suggested to me the sowing of Black-eyes the first of each September, to be grown as a fall cover crop and to be left standing until time for spring plowing.

And that is the reason why, after running the gamut of cover crops, I am now consorting with the common Black-eye. I do not pretend that it would be a success except in elevated locations where the nights are relatively warm and the autumns are long. Although it does not grow as tall as the cow pea proper it matures more quickly and six weeks of warm weather after planting will insure a substantial crop of humus forming material. In answer to the objection that a summer cover crop robs the soil of nitrogen needed for the orange crop it may be said that the orange crop is practically assured by September 1, the date on which I suggest sowing the Black-eyes.

At the time I was getting the Black-eye idea last fall a movement was under way for popularizing the horse bean as a fall cover crop. I believe the experiments were not wholly successful in getting a stand.

The seed cost seven cents per pound and as the individual seeds are very large the expense for seeding was a considerable item. The price of Black-eyes is now about four cents per pound and there are several times as many of them in a pound as of the horse beans. The philosophy of one planter whose horse beans failed to come up was: "Oh, well, the beans were so large that I got a lot of fertilizer out of them anyhow." But the loss was out of proportion to the gain.

One-half of my orchard (alternate lands) is now in Black-eyes. During the last week in August the other lands will be sowed to them. Of course the land is furrowed for irrigation immediately after planting. Anyone having a good well and pump or other source of water will find irrigation as cheap as cultivation. It is a case, perhaps, of pumping plant versus cultivator, with this consideration in favor of the former, to-wit: That it is putting humus into the soil while the latter is not.

I have said that abundant water is a condition necessary to the growth of a summer cover crop. It should be added that an abundance of humus in the soil is another requisite in order that both the fruit crop and the cover crop may find sufficient nitrogen. I do not question the statement that leguminous plants can and do take nitrogen from the air; but I believe that they prefer to take it from the soil, even robbing their neighbors if necessary. It is a Scriptural precept that "to him that hath shall be given"; and this is eminently true in the production of a cover crop.

Throughout the orange growing districts of California today there are orchards that look lean and hungry Their owners have tried to see how little fertilizer they could get along with. The auto has had its full quota of gas and oil, perhaps. There has been no limit put on family expenses. Social appearances must be maintained at any cost. In short, there are many orange growers who, unconsciously, have been eating up their capital by permitting the depletion of their humus account in the soil—and Mother Earth is now handing them a statement that their account with her is overdrawn. What would be said of a furniture manufacturer who would permit his supply of lumber to give out while his machines were running and his employes were on full pay and expense; or of the dairyman who let his cows go hungry on the plea of economy? These people plan to have their machines and their employes and their cows convert as much raw material as possible into marketable products. Should not the orange grower use the same logic?

In conclusion—and my argument is based upon both experience and observation—I would say: Buy your nitrogen in the bulkiest possible form for the sake of the resulting humus. Buy all the stable manure or other organic matter you can find money to pay for. And in addition grow all the cover crop you have fertilizer and water for in order that your soil may be leavened and lightened and restored to that approximately virgin condition necessary to put new growth on your trees and new zest in your faith in the orange industry.

Winter Cover Crop and Frost

By E. L. Koethen

AFTER looking over the field it occurs to me that some statement covering the extra hazard incurred by the use of a cover crop in winter in frosty locations is one of the livest questions. Some one thinks he has seen that orchards under cover crop were more liable to frost injury than those under clean culture and has carefully disseminated his observations. The result is that many others think they have seen the same thing. The writer thinks perhaps the observation is correct but that the danger may be avoided by the simple device of irrigating more freely at the time of possible visits of the frost. This can usually be done in the late fall and winter when there is abundance of water to be had.

It is a well known fact that freezing water or vapor gives off latent heat, that a white frost is less dangerous than a "black" frost, that freezing water in the potato cellar will protect the potatoes. It only requires a little observation to come to the conclusion that in wet cover crop orchards white frosts occur, that the air is so dry under our frost conditions that a white frost cannot occur in a dry orchard on account of the extreme dryness of the atmosphere. It is true we do have slight white frosts all through the winter but our heavy freezes are accompanied by dry north winds.

The situation is a serious one as many are being deterred from planting cover crops this season for fear of the danger from frost. We are convinced that the cover crop has done more to break up the tendency to irrigation hard pan and clear mottle leaf from orchards than any other thing. It would be a pity if such a good practice should be abandoned under a misapprehension.

Our own observation is that where the ground is kept quite wet during the months of November, December and January the danger from frost injury to trees and fruit is diminished. On the other hand, if allowed to become dry and frosts occur, we believe the green surface may expedite radiation of heat enough to endanger the crop. Some years ago the writer made some temperature tests in the orchard during February, the object being primarily to determine if the soil was warm enough during frosty weather to encourage nitrification. It happened to be a steady siege of frosty nights, and we found that invariably the air and the soil were warmer under the cover crop than it was out in the open orchard. Our conclusion from this is that the cover crop becomes a reservoir of warmth during such times. It is a well established practice in many groves to arrange to

OUR ADVERTISERS RELIABLE
We guarantee our subscribers against loss through dishonesty of any advertisers in the Cultivator. We do not attempt, however, to adjust trifling differences between subscribers and honest, responsible advertisers, nor will we pay the debts of honest bankrupts. Notice of complaint must be sent us within 30 days from date of the transaction, and the subscriber must have mentioned the Cultivator when writing the advertiser.

THIS WEEK'S COVER

When we that are gray-heads were boys our 'rithmetic lesson gave us most satisfactory information as to how to figure up the cost of nine pounds of eight penny nails at five cents a pound or ten yards of calico at four cents, but never how to figure out balanced rations for pig or cow, or any other farm problem which would add to the efficiency of a farm helper or farm owner. The only information needed to conduct agricultural practices of those days was brought out by the question: "How did dad do it?" Today it's different, and the youngsters are being informed as to problems of agriculture and, better, as to best practices. This is being done not only by a series of valuable textbooks but by actual field work. The effectiveness of this education is shown by the demand for competent instructors which is far exceeding the supply. But they are coming, and here and there in various of our localities the high schools are giving proofs that the country is securing better methods. We are glad to give on fifth page of this issue information as to methods which are being followed in Arizona; also to give more graphic evidence of the work of Arizona boys in the illustrations on cover and in the article mentioned.

Tom, Tom was a farmer's son,
Bought a pig and home did run.
He fed him according to latest rule
As he was taught by the pig club's school.

GOT YOUR NEW HEADLIGHT?

The days of grace allowed under the headlight law have expired and every motorist who is now riding with undimmed lights is subject to arrest. It's a matter of only three or four dollars—and it may save a life.

ALMONDS

Manager Tucker of the California Almond Growers' Exchange writes that the almond crop for 1919 will be about one-third greater than that of last year and will be by far the heaviest tonnage yet produced in this state. The best part of it is that the Exchange has sold practically every pound of nuts it will control and at a price which it itself will name. Its first delivery was made August 6 and the first car load of almonds left for New York City August 13. The car contained 500 bags of Nonpareils.

Here is proof of the value of cooperation. The grower has not waited for the speculator to set his prices; he is delivering the goods and still holds the reins in his own hands.

A FRUIT GROWING STATE

The Cultivator will give next week data furnished by the bureau of crop estimates as to the output of pears and peaches of the United States, and this is worth most careful reading by California fruit growers. We often refer to California's greatness as a fruit grower and glibly roll off the claim that we are by far the greatest fruit state in the Union, but we believe we seldom stop to survey our real position. For instance, in peaches it is estimated that this year's output of the United States will be 29,784,000 bushels. Of this California will produce considerably more than one-half, or to give exact estimate, 16,060,000 bushels.

Georgia is the second great producing state, but it produces only 2,964,000 bushels. Third in the list is Arkansas with 1,444,000 bushels.

California is the only state which is credited with 100 per cent condition of its peach crop. Some of the Middle West states show almost total failure, for instance Indiana has a 12 per cent and Ohio a 20 per cent of normal crop condition. These abnormally low conditions are seen to be more serious when it is considered that they are better than at the same period last year. Some of the states show total failure last year in peaches.

In pears California produces a still greater percentage of the supply of the country, especially a greater percentage of the fresh shipping fruit. With peaches 80 per cent is either canned or dried in the state, while with pears by far the greater proportion is shipped fresh.

SPENDING $40,000,000

The state highway commission now has before it the duty of spending $40,000,000 of the people's money and giving them somewhat more, if possible, than $40,000,000 worth of state highways.

The first embarrassment which faces the commission is the fact that the people, after supplying the $40,000,000 very freely, are now demanding immediate delivery of the goods. A perfectly legitimate and a perfectly proper demand, but at the same time if the $40,000,000 is to bring to the people its full value in good roads it will take time to set in motion all the wheels of legal and other machinery, and still more time to set in motion the wheels of material machinery to move all the great amount of supplies necessary to construct these roads in various sections of the state from Modoc to San Diego. If this $40,000,000 is to be spent wisely it will require months, possibly years of careful management. Let us not all be too demanding as to delivery.

CODE OF HONOR

Dean Van Norman, in his address to the recent graduating class of the University Farm School at Davis, suggested the following code of honor: for the farmers of California.

"That the land we cultivate and the flocks we feed shall be more fertile and more productive because they have been ours, aside from any wealth they may have given us.

"That we give freely to our neighbor of the fruits of our experience and observation, for agriculture is not a secret to be locked up from our competitors.

"That, as the products of agriculture are vital and essential to the life of society, so is the constructive thought and effort of man on the land necessary to solution of great problems confronting this nation. And so, the gift of ourselves to the community is as vital as the product of our lands."

CUTTING DOWN EXPENSES

Who saved the cause of the Allies in the war and who is to blame for the high cost of living are two pertinent questions sufficient to start a corner grocery discussion of great earnestness. We have no answers prepared that are intended to settle either of these questions conclusively and do not wish to be called in as a judge when the debates are pulled off, but perhaps one of the best suggestions as to who is to blame for the high cost is that the consumer is the guilty party. He is rather insistent that he likes 65 and 70 cent bacon, $12 shoes and $75 suits, and so long as he is the retailer will be inconsiderate enough to meet his demands.

There is little opportunity for the small wage earner living in the city to practice more serious economies than he has been practicing. Such people not only suffer great inconvenience but we fear even actual discomfort. What little advantage there is is on the side of the producer, that is, the family living on its own little ranch has opportunities of making savings, with perhaps less demand for high cost articles. In making suggestions for little home economies Clarence Ousley, assistant secretary of agriculture, has the following hint for home makers:

"Home canning, drying, brining, preserving and pickling are big factors in cutting down household expenses, and, in my opinion, information concerning right methods of conserving food will be sought by housewives this summer and fall more than ever before. The newspapers of this country can give this service.

"Food and time are too expensive nowadays to waste fruit and vegetables by wrong methods of canning.

"Thrift in the home is the foundation of national prosperity and independence. Help increase it."

The second time President Wilson has vetoed the bill passed by both house and senate repealing the daylight saving law. The house has now passed the bill over the president's veto. It is predicted the senate will pass the bill by the required two-thirds within a few days.

RE-EDUCATION

Disabled ex-service men are being taken care of by Uncle Sam or, rather, are being given opportunity for re-education which will enable them to take care of themselves. The board for vocational education is urging every disabled ex-service man to get in touch with the board which is located at 200 New Jersey Avenue N. W., Washington. Many of these disabled men have been discharged from the service without knowledge of this opportunity which the federal government is offering, and the board is now endeavoring to reach them wherever they may be, and where their disability is such that they cannot follow their old callings they are to be given opportunity for an education which will fit them for the new work. This is not a charity; it is not paternalism at all; it is simply fitting the young men to care for themselves.

WORKING THE PRODUCERS

The farmer's business is a home producing, yet the farmer who neglects to market neglects the greater half of his business and runs the chance of suffering a hundred per cent loss on his year's endeavor. But if he goes to market, "gets nervous" and lets his product go at prices which not only cause loss and disappointment to him but injury to others?

Here is a quotation from the market report in a daily paper. It is only a short paragraph from a column of discussion of the day's transactions but it is characteristic of every day on every market:

"Activity featured the majority of the dealings on the floor of the local produce exchange yesterday and all lines of produce moved rapidly on a slightly lower market, owing to the active competition between the wholesalers and the farmers from the local producing sections. The farmers appeared on the market early and in view of the heavy late arrivals they became nervous and moved their commodities as quickly as possible at very low levels. This had a strong tendency to hammer prices down as the large retail dealers and the local shippers took advantage of the nervous condition on the floor and smashed prices during the early part of the session. During the latter part of the afternoon when the farmers had practically sold out all their products prices began to strengthen as the wholesalers tightened up and refused to sell at the low prices obtained at the opening of the call."

The producer of potatoes or cabbage or fruit helplessly throws up his hands and says: "What can we do? We can't stay all day long disposing of our produce when the coming crop call for our oversight on the ranch."

Our only suggestion, the only effective one we can think of, and one which we have often given, is expressed in the one word, "cooperate." In efficient cooperation where the cooperators are big enough to secure a thoroughly efficient man to do the marketing the producer continues to produce, continues to do the work for which he is fitted and entrusts the barterling to one trained in that service. The fact that a certain commodity is quoted at a certain price on any day in any market is no proof whatever that the producer will receive the price. Trafficking in farm products, especially perishables, becomes more and more complicated every year. It needs the trained manager who is able to remain with the buyer until the "nervousness" which sometimes affects the trade is on the side of the buyer rather than that of the producer. The producer may control if he will.

Arizona Pig Club Boys Bring Home the Bacon

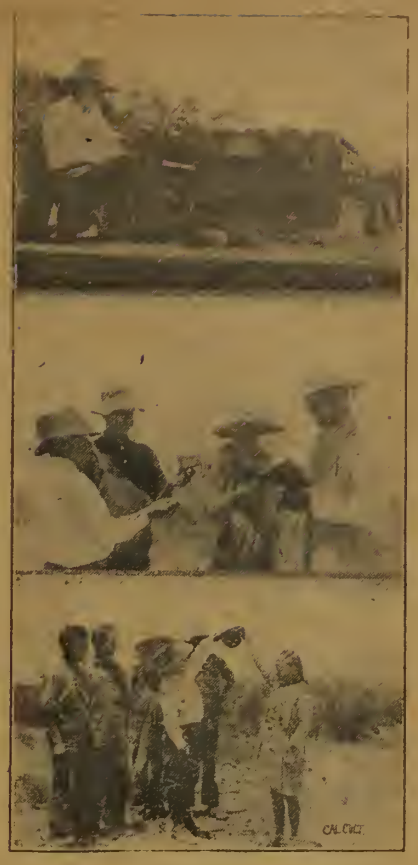
ARIZONA schools have live wire youngsters who have learned some lessons as to the value of pure bred hogs. They seem to have absorbed the idea that a pure bred makes lard, bacon and hams of more uniform quality and with more profit to the feeder and more certainty of winning the prize than does the ordinary scrub "just hawg." By prizes we mean in this instance cash prizes which were offered to the boys of Arizona if they would get busy and grow hogs and grow them right, but by prizes we also mean the prize of coin of which this tangible prize is but the visible evidence. This latter mentioned prize is that which comes to the producer if he takes to market hogs so uniformly high graded that they command a premium above top quotations. This is no dream, for incidents are plenty in which even the "packer" has come across with prices above the day's quotation. The boys who entered into the contest now referred to are members o fthe Davidson School Boys and Girls United Clubs. This school is in the Bingingham district of Tucson. The leader is Miss Pauline Naillon. State Club Leader Park writes regarding the achievements of these youngsters:

"All of the boys purchased registered Duroc gilts two months of age at a cost of $12.72 each, shipping them in from the Salt River Valley, one of the richest hog producing sections of the state.

"Reese Evans, aged 15, was responsible for interesting the other boys. Reese purchased a registered Duroc last year and swept the field at the Southern Arizona Fair at Tucson. Furthermore, a conservative value of $60 was placed on the sow at eight months of age.

"The boys' pig clubs are proving strong factors in building up and making substantial the swine industry of the state.

"The bankers of the state are fully alive to the possibilities of the work. Five hundred dollars has been donated for prizes, and loaning money to the boys is now recognized as good, sound business."



Human Interest in a Pig Story

Upper picture shows Reese Evans leaving the railroad station with the pigs.

Middle picture, boys coming across with the money. Every lad paid cash right on the spot.

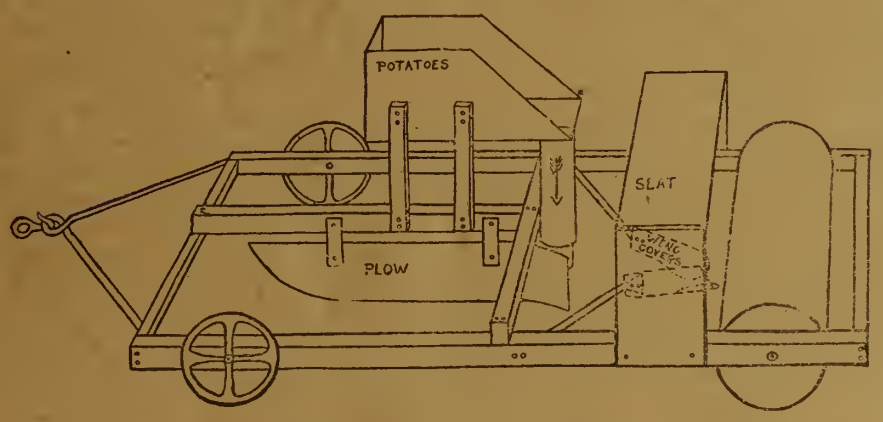
Lower picture—drawing for the pigs. Another scene appears on the cover of this issue. It is not a picture of the little pigs going to market but of the little pigs going home from the market to make hogs of themselves.

A Home-Made Potato Planter

By Edward C. Hawley

HERE'S a potato planter any farmer can make in less than a day at very small expense. Almost any scrap lumber pile on the average farm will furnish most of the material to make it. With it and a team of horses two people can plant three to five acres in a day. It does the whole operation, i. e. makes the furrow, drops the potatoes, covers, also tamps or rolls the ground. A woman can drop the potatoes as well as a man.

Have your blacksmith make you a plow as shown in the drawing, or make it yourself if you have a shop; also two fenders or wings for covering have to be made of iron. Two by three inch or two by four inch scantlings are all that's necessary for making the frame. A box or contalner for the potatoes, and a seat for the operators must be provided. A piece of four-inch stove pipe, or galvanized pipe which is better since it won't rust, must reach from the container to back of the plow for dropping the potatoes through. Don't use a tapering pipe, for large pieces of potatoes sometimes lodge and you're likely to go quite a distance before you discover that the pipe is filling up instead of letting the pieces through. For wheels, those off an old cultivator or plow will do, or you can make a sled arrangement. However, wheels make it much easier on the horses and are more satisfactory in every way. For the roller we used a piece cut from a sycamore log; a neighbor who made a planter used the roller off an old windlass. It is well to arrange fastening the plow to the frame so it can be adjusted for deep or shallow planting, by having extra bolt holes through the iron straps. A short chain can be fastened to drag behind to mark for the row, and if you care to leave your planted rows marked a piece of old hose nailed around the roller directly in line with the plow will do. A clapper to indicate the distance to drop the potatoes can be made by nailing a piece of heavy sheet iron on the frame back of the roller so that an inch or two projects ahead, then nail some spikes, at the required distance apart for planting, in the roller, leaving about an inch out to strike sheet iron clapper.



Outline of Practical Potato Planter.

Detailed drawing of potato planter from sketch made by Edward C. Hawley. Planter should be three feet wide and six feet long; the roller about 12 inches in diameter; the plow about three feet long; the hopper amply large enough to hold a pail and a half of cut potatoes—about two cubic feet.

To operate, the teamster must drive slowly, and very straight. After planting three or four rows the dropper begins to get the knack of it. It's a good plan to pick up three or four pieces of potato with one hand while you're dropping with the other.

Any farmer who expects to plant one or more acres of potatoes every year should make a planter like this; one day's use of it will more than pay for it. On a small farm where it would be putting too much money into equipment to buy a manufactured one it is just the thing, and it will "fill the bill" perfectly on a large potato farm if for any reason the farmer cannot afford to buy a factory made planter.

Proper Maturing of Avocados

By Prof. Ira J. Condit at Pasadena Meeting of California Avocado Association

THE history of fruit marketing in California abounds with accounts of the sales or attempted sales of early season fruits in order to benefit from high prices. This is the time of the year when we read in the press of the fancy prices paid in Chicago, Boston, or New York for the first box of cherries from Vacaville, apricots from Redbank, or figs from Coachella. The saying that "most people eat with their eyes" is true with regard to a number of California fruits, but we must all admit that however attractive early apricots, peaches, or cherries may appear to the eye, their flavor and quality are as a rule decidedly disappointing to the taste. California Navel oranges may be picked when green, sweated to produce color, and sold at fancy prices in the Eastern market, but the consumer's appetite for more is to say the least, certainly not stimulated. The marketing of olives for ripe pickles reached such an unsatisfactory state recently that a maturity standard for this fruit has been established. The marketing of immature avocados in California has been practiced for several years, and it seems at times unfair to censure the grower who handed over the fruit to the purchaser at 50 cents, 75 cents or $1 each rather than leave it on the tree to suffer possible injury or total loss from wind, frost, or theft. In the discussion of this subject therefore it seems best to treat it under the following headings:

The need of a maturity standard for the avocado.

Maturity standards for other fruits.

The possibility of finding such a standard for the avocado and of enforcing it.

Is there a need of a maturity standard for the avocado? According to the opinions expressed by experienced growers it would seem that there is. Some of these expressions are as follows:

"My personal opinion is that any one offering immature avocados, while knowing them to be such, should be censured in the highest terms. It seems to me that, in the inception of the avocado industry, when not one person in 1000 has ever tasted the fruit, a special safeguard should be thrown around the quality of those offered for sale."

While we will all agree that a half or three-fourths grown avocado will soften and become edible even though not very palatable, we must admit that the same avocado would be incomparably more satisfactory if allowed to reach a more mature state on the tree. Note I say a "more mature state"; if left on the tree too long the flavor and quality is very likely to be impaired. An increase of from 26 to 28 per cent in fat content has been accompanied with a much poorer quality of fruit.

Analysis of the fruit at Berkeley certainly show that the oil increases with the ripening but the correlation between the percentage of oil and the

Agricultural News Notes of the Pacific Coast

Northern California

The Los Mollnos farm bureau will meet August 25.

Arbuckie, Colusa County, is harvesting its almonds.

California's rice crop will be worth $33,000,000 this year.

Callfornia's auto vehlcles have increased 68,359 during the past year.

The Solano County farm bureau wants a market director, chiefly to manage stock sales.

The Wyandotte farm center of Butte County is mapping out a campaign against cltrus blast.

Cloverdale, Sonoma County, recently shipped 1500 head of sheep and 51 head of cattle on one day.

The Napa County fair will be held at Napa October 2-5. Nathan F. Coombs is secretary-treasurer.

Farm Adviser Jones of Eldorado County is securing lime for members of the farm bureau at $4.00 a ton.

Contra Costa County will hold a fair at Martlnez this fall. Clark Farnum has been selected secretary-manager.

The University Farm at Davis will exhibit at the coming state fair a calf for which the Unlversity refused $3000.

Tehama County farm bureau meetings: Richfield, August 18; Corning, 20; Los Molinos, 25; directors meeting, 22.

Veterinarians are busy in the Willows section of Glenn County vaccinating cattle, hogs and sheep against anthrax.

The women of the Sacramento County farm bureau are talking of getting a permanent home demonstration agent.

Glenn County's farm bureau meetings: Larkin, 22; directors meeting, 23; Elk Creek, 27, 2 p. m.; Grapevine, 27, 8 p. m.

The farmers of Del Norte County have organized and will affiliate with the organizations of the Humboldt County farm bureau.

The first delivery of almonds from the Durham district of Butte County was made to the warehouse of the exchange at Chico, August 6.

There will be meetings of the Glenn County farm bureau at Larkin, August 23; directors meeting, 27; Elk Creek, 27, 2:00 p. m.; Grape Vine, 27, 8:00 p. m.

A thousand tons of ice are used daily at the Roseville plant of the Southern Pacific, icing California fruits and vegetables on the way East.

Members of the Butte County farm bureau have voted to hold a citrus day in the near future, possibly at the time of the horticultural convention at Oroville.

Commissioner Brosius and Adviser Jarvis of Sacramento County piloted a party of pear growers through some of the representative pear growing districts of the delta section of Sacramento County.

Rice growers may obtain permits to shoot the ducks which are destroying their rice fields. Permits are given on the same terms as last year, that is, that the ducks may not be sold. The permits are issued by Pres. J. H. Stephens and C. H. Merry of the California Rice Growers' Association.

Central California

Watsonville has begun its apple shipping season.

Watsonville shipped 83 carloads of apricots this season.

The Walnut Grove section will ship 650 carloads of fruit, principally Bartlett pears.

Workers in the Lodi Cannery are dissatisfied with wages and working conditions.

Fruit shippers in the Lodi district have suffered from car shortage for some time.

At the recent farm bureau hog auction at Fresno 35 hogs averaged $21.30 per hundred pounds.

The prices on all varieties of beans are coming up, but of course few are left in growers' hands.

Santa Cruz County farm bureau has sold to members over a ton of poisoned barley for squirrels.

Hanford, Kings County, will hold Pork Day, October 15. Fifteen carloads of hogs will be auctioned.

The California Automobile Association has begun a campaign to preserve the redwood groves of the state.

At the Hanford hog auction of the farm bureau marketing association 275 hogs were sold in one lot at $20.75 per hundred.

Citrus growers of the Richvale district, Tulare County, will deliver their fruit to the new packing house to be erected at Terra Bella.

Shipment of Tokay grapes has begun from the Lodi section of San Joaquin County. The first shipment was made to New York City.

The Lodi district of San Joaquin County will have an average crop of tomatoes. Most of the near-by counties expect only about a half crop.

The Terra Bella Citrus Association has been organized with a capital of $25,000. It will build a packing house in time for next season's pack.

A conference will be held in Tulare September 5-6 to consider plans for conserving water supply from all sources feeding irrigation districts of the San Joaquin Valley.

One irrigator at Clovis who took irrigation water from a ditch and away from the rightful owners was fined $100, and in inability to pay the fine was committed to jail.

County horticultural commissioners of Tulare, Fresno and Kings Counties at a recent meeting at Sacramento decided on a rigid campaign of inspection on all shipping grapes.

Kern County is in the midst of a campaign for extension of irrigation. A plan is now contemplated to bring 400,000 acres of land near Delano, McFarland and Richgrove under the water.

Arrests and fines because of fruit packs not coming up to legal standard are becoming so common in various counties that we are perfectly safe in predicting material increase in quality of California fruits shipped out of the state.

The Poplar farm bureau center has a pig club of 16 members that will conduct a litter contest. Each member has purchased a pure bred gilt. Twelve Poland-Chinas, three Durocs and one Chester White were purchased. H. C. Carr of Porterville is the club leader.

Southern California

Elsinore cannery began on tomatoes August 5.

Beaumont will have 100 carloads of apples to market.

Lima beans are still advancing, now selling around $11.75.

Rialto grapefruit growers report sales in New York at $9.05.

Hemet recently made large shipment of canned apricots to Norway.

Downey, Los Angeles County, will hold its community fair August 28-29.

The Ventura County farm bureau is making plans for a fair to be held in October.

The cannery at Fallbrook, San Diego County, began on tomatoes, August 2.

Horticultural Commissioner Ryan of Los Angeles County will soon start a squirrel drive.

Southern California's output of walnuts will be 25 per cent greater than any preceding year.

Imperial Valley cotton growers are making plans to secure a sufficient number of pickers.

Brawley, Imperial County, has 500 acres in cotton. Most of it is of the short staple variety.

Congressman Osborne of Los Angeles is working for a two cent duty on imported beans.

Lemon growers of La Verne have formed a lemon association to cooperate with the Exchange.

The San Dimas marmalade factory is putting on more help every week. The cull packing house is also busy.

Rialto, San Bernardino County, reports citrus pack practically ended for the season. It has less than 100 cars yet to go.

Work on the new date packing house at Indio, Riverside County, is progressing. It will be ready for the fall pack.

Horticultural Commissioner Kellogg of Santa Barbara County reports successful dusting campaign against walnut aphis.

There will be a deciduous pruning demonstration at Owensmouth August 28 at the regular time of the farm bureau meeting.

The value of cooperative marketing was discussed by C. C. Teague, Santa Paula, at a meeting of Orange County growers at Santa Ana, August 13.

The last meeting of bean growers was held at San Luis Obispo, Saturday, August 9, to discuss some means of stopping importation from Japan.

Little Rock, Los Angeles County, celebrated Pear Day August 2. Little Rock will this year ship out 100 carloads of pears. Near-by districts in the Antelope Valley will add another 50 carloads.

Commissioner Waite of Imperial County reports that estimates for next year's planting of cantaloupes run as high as 25,000 acres. This year's planting was 14,088. Some plantings on sandy soil were seriously injured by root knot nematode.

The fight between Los Angeles County supervisors and the Rindge estate over the county highway through the Malibu ranch toward Ventura County is continued through attorneys asking that the board be enjoined from condemnation proceedings. This fight is of years standing.

The Coast and General

There is a big apple crop in the Northwest this year.

Dry farming sections of Arizona report crop prospects excellent.

The Southwestern Washington Fair will open at Chehalis, August 25.

Arizona, Idaho, Nevada and Utah have had welcome rains this month.

Texas watermelon growers have suffered seriously from car shortage.

The Wenatchee Valley of Washington will harvest over 9000 carloads of apples.

The wheat harvest is nearly completed in the Walla Walla district of Washington.

Rains in Arizona have increased the water supply in the reservoir back of the Roosevelt dam.

Fruit growers of the Sunnydale district near Seattle hope to have a cannery in operation next year.

The Yakima Valley of Washington expects to market over 7000 carloads of the best apples ever sent out.

Dairymen of Skagit County, Washington are organizing to affiliate with the state association in marketing.

Apple growers in the Wenatchee district of Washington are fearing a box shortage. Boxes are now selling at 20 to 22 cents.

Valuation of taxable property in the state of Arizona has increased $21,000,000 since the last assessment figures were made known in 1918.

The making of peanut meal is now a feature of manufacturing in Charleston, South Carolina. The meal is used to feed cattle, hogs and horses.

Berry growers at Puyallup, Washington, are paying 65 cents a crate for picking Cuthbert blackberries and it is sometimes hard to find pickers.

Recent heavy rainfall in the Salt River Valley of Arizona has caused a too rank growth of cotton plants on heavy soils, but little shedding is reported.

A plan for federating all the farm organizations of Washington was discussed at a meeting of representatives of farm organizations held at Yakima on August 4.

The Hood River Valley of Oregon will have a smaller crop of apples than was anticipated. It will amount to only about 2000 cars, including cider and cull apples.

Fruit growers of the Hood River Valley, Oregon, are promoting a campaign to have better cows on all fruit ranches. Their slogan is "Get rid of the I. W. W. cows."

Charles P. Mullen, president of the Arizona Cattle Growers' Association and a prominent cattle man of the Southwest, was chosen president of the United Stockmen's Association at a conference held at Salt Lake City.

Milk producers supplying Spokane distributors demanded an increase from $3.08 to $3.55 per hundred pounds. At the same time the distributors increased the price of milk to consumers from 14 to 15 cents a quart.

The Willamette Valley Mint Growers' Association, Oregon, has pooled crops of members this year. They hope to get from $8.00 to $10 per pound of oil. There are 300 acres of mint owned by members of the association.

Preserving Fruits For Exhibition

THE Ventura County farm bureau is sending out some information which will be of interest to Cultivator readers. Many have wondered how the beautiful glass jar exhibits of fruit in chambers of commerce expositions were prepared. Here are instructions. But a little word of warning—experience and good judgment are as much a factor in the securing of satisfactory results as in cooking; there is something needed beside the recipe.

Where it is desired to keep fresh fruit and vegetables for exhibit purposes, they are sometimes covered with a thin transparent water proof layer, which prevents evaporation of the moisture inside. A successful casing for this purpose can be made by mixing, while heated, one part of tallow, two parts beeswax and two parts paraffin oil. Apply in liquid state with brush or cloth or by immersing the sample in the liquid.

When coating pumpkins, squashes and other products with rough, thick rinds, add one-half ounce of gum arabic to the quart of mixture. A preparation known as parawax is satisfactory when there is only a small surface to cover. Two or three coatings of the above mixture may be necessary, depending upon the amount of handling and exposure.

Where it is desired to preserve some especially fine specimens of fruit and where it is not desired to use them for food after exhibition, they may be preserved in various kinds of antiseptic fluids.

Select the finest specimens of fruit, both as to form and size. Handle them carefully to avoid all bruising, and place them in bottles, arranging them so as to show them to the best advantage. Fill each bottle to the neck with fruit, then pour on the fluid recommended, filling the bottles to within one-half inch of the stopper, so as to entirely cover the fruit; then place the stopper in the bottle and run a little melted beeswax or paraffin over the joint to make it air tight. Tie the stopper down with a strong piece of cotton, and attach to each bottle a label containing the following particulars: Name of the variety of fruit, name and address of grower. Write also in each case in one corner of the label the fluid which has been used. Wrap the bottles in paper to exclude the light and preserve in a cellar or other cool place until required for exhibit. Strawberries and raspberries should be cut from the plants or bushes with a pair of scissors, leaving a short piece of stem attached to each.

Formalin

For red currants, red or black cherries, red or black gooseberries, red or black grapes, dark colored plums, strawberries.

Formalin (Formaldehyde) one pound (16 ounces); water, 21 quarts; alcohol, five pints.

Allow the mixture to stand, and should there be any sediment, pour off the clear liquid and filter the remainder through filter paper.

This two per cent solution of formalin, or formaldehyde, has been found very useful for preserving strawberries, so as to give them a natural appearance.

In each case where this fluid is used, mark "F" on one corner of the label.

Boric Acid

For red apples, blackberries, black currants, red raspberries, black raspberries.

A solution of boric acid in the proportion of two per cent.

Dissolve one pound of boric (boracic) acid in 22 quarts of water, agitate until dissolved, then add five pints of alcohol. If the fluid is not clear, allow it to stand and settle, when the clear upper portion may be poured off and the remainder filtered.

In each case where this fluid is used, mark "B" on one corner of label.

Zinc Chloride

For green or russet apples, russet pears.

A solution of zinc chloride in the proportion of 3 per cent.

Dissolve one pound of zinc chloride in seven quarts of water, agitate until dissolved, then add one and two-thirds pints alcohol. Allow the mixture to stand until settled; then pour off the clear liquid and filter the remainder.

In each case where this fluid is used, mark "Z" on one corner of label.

Sulphurous Acid

For white or yellow apples, apricots, white cherries, white currants, green or yellow grapes, nectarines, peaches, green or yellow plums, quinces, white raspberries, green or yellow pears.

Sulphurous acid, one pint; water, eight pints; alcohol, one pint.

Allow the mixture to stand, and should there be any sediment, pour off the clear liquid and filter the remainder.

In each case where this fluid is used, mark "S" on one corner of label.

ORANGE OUTLOOK

The orange outlook, according to United State bureau of crop estimates:

Prospects for a big orange crop have gone glimmering in the heavy "June drop" which this year continued well into July and hit the Valencias harder than in either of the past two years. Temperatures were high right up to and including July 25 and irrigating water none too plentiful, which were doubtless the principal causes of the prolonged period of dropping.

While not able to personally visit the citrus districts during the month, reports from growers were numerous enough and sufficiently well scattered over the five big counties to supply the best of information concerning conditions. For the state the condition is about 65 per cent of a normal or practically the same as one year ago. Navels were reported at 61 and Valencias 75. August 1, 1918 Navels were 56 and Valencias 82. Such a condition warrants a forecast of 14,500,000 boxes of oranges divided about as follows: Los Angeles, 5,000,000; Orange, 2,000,000; Riverside, 1,500,000; San Bernardino, 3,500,000; Tulare, 2,000,000; Northern California, 150,000; San Diego and Ventura, 250,000 boxes.

Shipments of the 1918 crop show that the growers were too pessimistic in reporting the August 1 condition and possibly may have erred in the same direction this year although it is hardly likely that the same error would be made in underestimating the crop two years in succession and immediately following last year's experience.

There seems to be no question of a smaller crop of Valencias this year although there is some new bearing acreage.

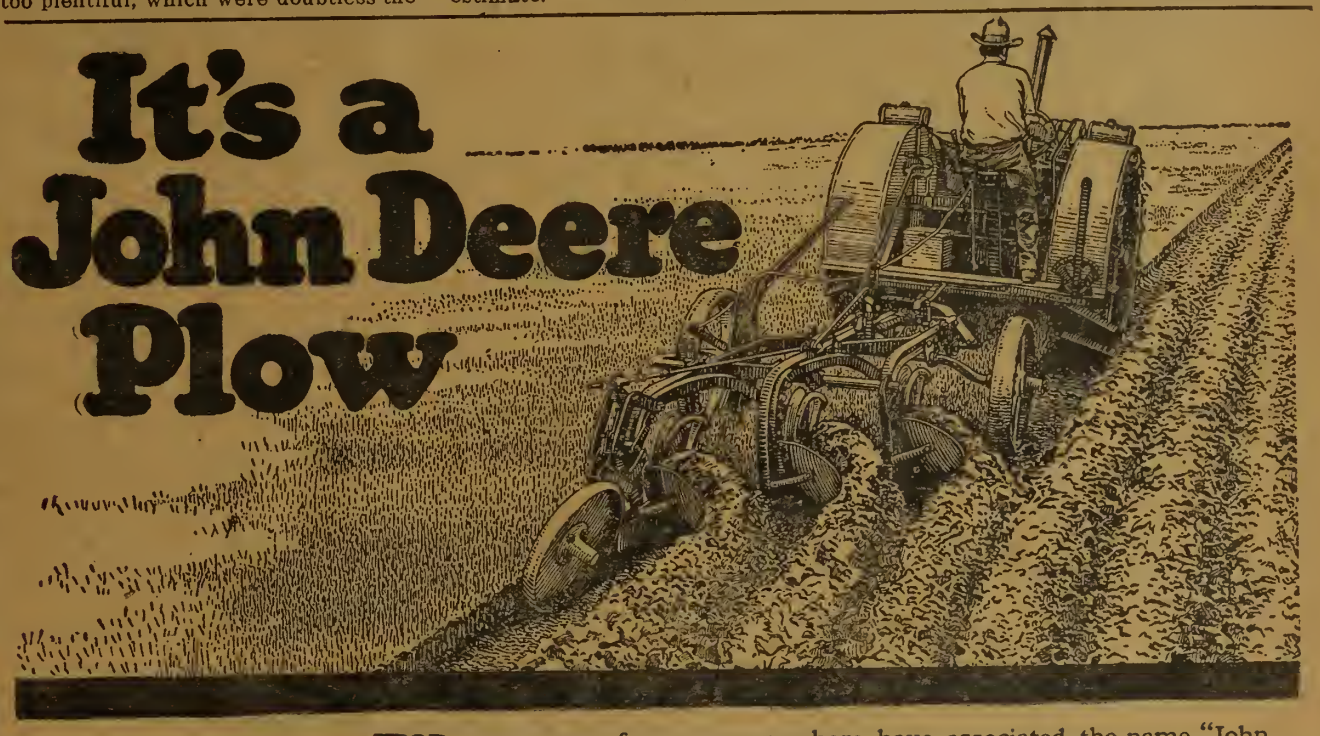
The reader should bear in mind this is only a forecast of production from the reported condition and in no wise must be taken as even a preliminary estimate.

CROSS POLLINATION

By Leonard Coates

This is always an interesting subject, made more so by the tests made by members of the Davis Farm staff of the college of agriculture. Every grower knows that some varieties bear better than others in some seasons and that some varieties in particular have established a record for regularity in bearing, while others are generally known as shy bearers. We all like to know why, and the microscope is called into use so that after a careful series of examinations and tests, certain varieties are declared to be self-sterile to their own pollen. But there are many orchards in California of these supposed self-sterile varieties, such as Bartlett pear, Satsuma plum, Burbank plum, Wickson plum, etc., which bear abundantly every year without any apparent cross-pollination. I owned an interest in a large pear orchard in Napa County 28 years ago, half Bartlett, half Winter Nelis. Neither bore although of sufficient age and full of blossom, until, in a fit of desperation the trees were very heavily pruned, decapitated as it were, while prior to that, a thinning out system was adopted. Next year they bore well and did so ever after. No reason has ever been given. In another orchard in Napa I planted 250 Satsuma plum trees in a block by themselves; they always bore well. In our present location near Morganhill we have over 1000 Bartlett pears which have borne well every year since they were old enough, and with no chance of cross-pollination. And

It's a John Deere Plow



FOR many years farmers everywhere have associated the name "John Deere Plow" with special plow quality—with better and longer plow service. Getting this quality is especially important when you buy a tractor plow. A tractor plow does work on a big scale—the quality of the work counts in proportion. A tractor plow must stand heavy strains—its ability to keep on doing good work year after year counts strongly in making plow profits. Remember, you get this special quality when you buy a

JOHN DEERE TRACTOR PLOW

Don't Forget

Good plowing is what you are after when you operate your tractor plowing outfit, and good plowing depends upon the plow. That's why it pays—always—to get the best plow you can buy. No matter what standard tractor you buy and no matter what type of soil you have to contend with, you can get a John Deere Plow, suited to your tractor and your soil, and thus make sure of good plowing year after year.

Sizes

Two-Bottom
Three-Bottom
Four-Bottom

Equipped With Genuine John Deere Bottoms—The kind that have an established world-wide reputation for long wear, good scouring and thorough seed-bed making. You can get the shape and type suited to your soil.

Holds to Its Work at Uniform Depth—It is *locked into the ground* at plowing depth through the action of the power lift. The land wheel is set back, balancing the weight of the plow over all three wheels, just as on your sulky or gang plow. Makes plow run steady and *assures plowing at uniform depth* in uneven ground.

Quick Detachable Shares—Strong and close-fitting. Loosen one nut to remove the share. Tighten the same nut and the share is on tight. *It stays tight.*

Extra Strong Construction—Extra heavy beams of special John Deere steel. We guarantee them not to bend or break. Heavy beam braces, long, lapped and securely joined to beam with heavy bolts and lock washers.

High and Level Power Lift—Lifting mechanism is simple, strong and positive. Parts move only when plow is being lifted or lowered—practically no wear.

Three Sizes—Two-bottom, three-bottom and four-bottom. One of the sizes suits *your* tractor. And, remember, the adjustable hitch adapts the plow for use with any standard tractor.

Farmers Everywhere are making sure of continued good plow service behind their tractor by getting John Deere Tractor Plows. Your John Deere dealer is ready to furnish you with one. We will be glad to send you a folder describing the John Deere Tractor Plow. Ask for Folder TP-24. Write today for full information.

John Deere Plow Co. San Francisco, Cal. Portland, Oregon

GET QUALITY AND SERVICE — JOHN DEERE DEALERS GIVE BOTH

The Demand For a Better Pea and Bean Thresher Has Been Met by the WADE

Old style threshers are not equal to the task of cleaning Western brown peas and beans, with their tough vines and luxuriant growth.

New Wade Features

A stronger Blower of new design and larger capacity with an improved Damper that controls the draft; a larger cleaning surface with the air currents concentrated instead of blowing broadcast through the machine; briefly describe the major improvements in the new WADE.

Wade Thoroughness Throughout

A Thresher that will stand up under abuse, built a lot better than seems necessary, and finished to the last detail, with a sacking attachment and capacity that is unusual, makes the WADE complete.

Write for Full Details

Booklets fully describing this wonderful machine, with illustrations showing its new features as compared with the old method and prices that are no higher than on the ordinary machine, will be gladly mailed without obligation. Write today.

so with the great Sacramento Valley pear orchards. Does self-fertility or its opposite self-sterility indicate the fertility or otherwise of the seed or fruit proper? And can what we call the fruit or really the pulpy covering to the fruit perfect itself even if its bloom were "self-sterile"? If so, the contradiction, or the mystery, ceases to exist; if not ——?

SPRAY FOR TOMATO LEAF BLIGHT

Spraying improves color and solidity of tomatoes, reduces rot and sunscald, and increases the yield of ripe fruit 39 per cent, and of both green and ripe fruit 55 per cent.

A small knapsack compressed-air sprayer may be used in this work. Such sprayers are light, easy to operate, and produce a fine misty spray. Several different kinds, varying somewhat in shape and construction, but built on the compressed-air principle, are now offered for sale.

A good spray formula is 5-5-3-50 Bordeaux soap mixture, composed of 5 pounds copper sulphate, 5 pounds stone lime, 3 pounds resin fish oil soap, and 50 gallons of water.

To reduce the work of preparing spray mixtures the following stock solutions were made: Five pounds of copper sulphate (blue stone) were dissolved by suspending it in a wooden vessel containing 5 gallons of water. Copper sulphate corrodes iron and tin. Five pounds of stone lime (quicklime) were slaked in another vessel by slowly adding water at first and later increasing the volume to five gallons. Three pounds of resin fish oil soap were diluted in a third vessel by stirring it in hot water until thin and increasing the volume to 5 gallons by adding water of ordinary temperature.

The semi-annual conference of the National Board of Farm Organizations will be held on September 16-17, 1919, at the new home of the board in Washington, D. C. Delegates from the great farm organizations of the United States, including grange masters, farmer union presidents, officers of grain, livestock, cotton, and the great milk producers' associations, have attended past conferences of the board.

TRACTOR DEMONSTRATION

The Traction Engine and Implement Dealers' Association of Southern California, encouraged by the increasing interest of the rancher in the tractor and power farming machinery, is making plans for the fourth annual demonstration on a scale more extensive than in any previous year. According to the management the coming meet, which will be held on the Rancho La Brea at Crescent and Melrose avenue, September 16 to 21, inclusive, will exceed in number of tractors and accessories displayed, and in attendance, that of any previous year.

This will be the largest working exhibit of power farming machinery yet shown, and in addition to the extensive line of tractors will include a display under a tent 100 feet by 350 feet of trucks, trailers, casings, solid tires, magnetos, lubricating oils and in fact practically every known accessory on the market essential to the tractor, truck and automobile. The original purpose of the association to emphasize the educational features of these annual demonstrations has been strictly adhered to, and to this fact is due the widespread interest in them shown by the rancher, orchardist and grower. The assembling on one field of every type of tractor, and power farming machinery manufactured and the display of the extensive and varied line of accessories affords an exceptional opportunity for the prospective user of these modern aids for the more economical development of the land.

Among the exhibitors will be the B. Hayman Company which will enter a full line of Oliver Chilled Plow Works implements, a complete line of Emerson, Brantingham, the E. W. Ross feed cutters, Planet, Jr., line Forkner cultivators and a new line of Roderick Lean disc harrows.

The International Harvester Company has listed the 10-20 Titan tractor, the 8-16 and 15-30 International, and a most complete general line of International and P. & O. Implements.

E. P. Bosbyshell Company will exhibit two sizes of Heider tractors, full line of Rock Island plows, W. W. alfalfa grinding mill, Clark Cutaway Harrows, Sandwich Hay Press, Knapp disc harrows.

William L. Hughson Company will exhibit Fordson tractors, special line of Roderick Lean harrows, also Amsco drills.

F. T. Briles Company will exhibit the Bates Steel Mule 15-20 Bernice chisel and subsoiler. Schmiesers land levelers. F. T. B. disc harrows.

Wm. Gregory & Sons has listed the Trundaar tractor.

Motor Equipment will display and demonstrate the Beeman tractor with a complete line of implements for same.

The immense accessory tent will be full of interest to the farmer and housewife, the list of exhibits including many time and labor saving devices.

Admission will be free, ample free parking space will be provided, and an excellent restaurant will serve meals at all hours.

AVOCADO REPORT

The California Avocada Association has a bunch of live members and they are making an exceedingly live subject, that of growing avocados in California. The association is just out with its report for 1918-19, a book of nearly a hundred pages, beautifully illustrated and well printed. One of the illustrations is a portrait of Judge Chas. Silent, one of the pioneers of the industry. Other illustration are of

fruits and orchard scenes, many of them in Mexico. This book contains the addresses delivered at the third and fourth annual meetings with notes and other items of greatest interest to the avocado grower.

PRINCIPLE OF CONTROL OF SCALE INSECTS

By Thos. O. McClure

There are many species of scale and these species vary greatly, besides the habits of a single species will vary, due to climatic and other reasons.

In some districts a species normally has distinct broods at regular intervals; in other districts this same species might be found to have a more or less continuous emergence or what would be termed overlapping broods.

The life cycle of the scale, from the emergence of the young to its natural death, is usually about 12 months.

Control the Young

In the control of scale the first thing to be remembered is that it is the young and not the old scale that is to be controlled. When the young first emerge they are so small that they are not noticed unless particularly sought for, and even then they may not be seen unless a magnifying glass is used.

Life Cycle

Some scale insects are hatched from eggs and some are born alive, but no matter which the case may be, they continue to grow in size and toughness until they reach maturity. Up to a certain period they have the power of locomotion and crawl about until they find a suitable place to attach themselves. Soon after they become permanently attached they lose the power of locomotion and there spend the rest of their life. The evolution which takes place thereafter varies according to the species. Some species, such as the black, brown, apricot and purple, lay a full quota of eggs (from 400 to 750 or more), while others such as the San Jose, oleander and red produce living young.

These eggs hatch out in due time and start the cycle of life over again. The old shell, which is most in evidence and often mistaken for the active insect, is either a harmless shell containing only the abandoned egg shells, or if it is before hatching time, will contain the eggs. If the eggs are still unhatched the shell may be carefully removed and the eggs dumped into the hand or onto a piece of paper for examination under a magnifying glass. As the scale becomes older it also becomes tougher until it reaches a point where it is practically immune to any control measures and therefore impractical to try to control.

To Check the Spread

It is very evident then that control measures should be applied as soon as possible after the emergence is complete. It frequently happens, however, that because of a heavy infestation or to check the spread of a new infestation it is not advisable to wait until the emergence is fully compete. This commonly occurs on citrus trees. In cases where the emergence continues over a considerable period the insects first hatched or born start to work on the tree and if no control measure is applied until the emergence is complete they will have done considerable damage. In order to check the depredations under these conditions it is often advisable and profitable to apply a control when the emergence is about 50 per cent complete and then again when the emergence is complete.

How to Tell

To determine the condition of the scale and when to apply a control, simply remove some of the parents and estimate the number of eggs still unhatched or the condition of the parent body if it is a species that gives birth to the living young.

Greatest Emergence

The greatest emergence of the young scale, no matter what the species, is usually between the first of June and the first of September. Exceptions must be made for overlapping broods due to climatic or other unusual conditions.

POISONING FROM ARSENATES

The question is often brought up as to the possibilities of poisoning from eating apples which have been sprayed to protect from codlin moth, or other fruits or vegetables sprayed with an arsenate or other insect poison.

Scientific people have given thorough examination to fruits and vegetable so treated, and in one case where apples were examined and every particle of poison removed it was found that it would require the eating of something like a half a bushel of apples, skins and all, in order to secure sufficient to injure the health of a human being. In this case the spraying was done something like two weeks before the time of testing the fruit. Many spray formulas containing these poisons are accompanied by warning that this spraying should not be done within two or three weeks of time of eating or marketing. Still there are cases where there has been injury, though in some of these more thorough examination of the conditions show a cause other than the spray applied to the food.

We now have a letter from Mrs. Robert Morse of Fallbrook who says that she was poisoned by eating two small apples which had been sprayed with arsenic solution and adds that she did not eat the peeling. She feels that her poisoning has caused a sickness which has lasted for two years and that warning should be given to all fruit growers to use greatest care and never spray matured fruit.

It is advertising that makes a big business out of a small one.

THE ALMOND SEASON

Almond harvesting has begun. The crop, according to government estimators, will be 30 per cent greater than last year; the Exchange estimate is a little higher. Last year's crop was 5100 tons.

The Exchange now has a membership of nearly 3000. It will make prices about the first of September. The estimated crop under its control has already been contracted at whatever price will be named at that time.

As you wander to and fro,
Smile, smile, smile.
Spread good cheer where'er you go,
Smile, smile, smile!
Keep your heart all free from guile,
Scatter sunshine all the while,
Be an oil-cup, not a file—
Smile, smile, smile!

—"The Crescent."

FORD OWNERS! TRY FOR-DO 10 DAYS FREE

EASIER TO PUT ON THAN NEW PLUGS

Send No Money

We want every Ford owner to try this wonderful new invention 10 days free, at our risk. Just fill out the coupon below, mail it today and we will send you "For-do" complete, postpaid, ready to use without a cent of pay in advance. When you receive it, put it on your car and watch results. See how much easier it makes your engine start, how much smoother your car will run; how much better it will pull, and how much more mileage you will get from the same gasoline.

More than 50,000 "For-dos" have been put on Ford cars the last 3 months. Get one to try 10 days free on your Ford. Send the coupon today.

"FOR-DO"

—Works wonders on Ford cars—
—Gives your Ford more power, more pep, more speed—
—Gives you 4 to 6 miles more per gallon—
—Enables you to locate engine trouble instantly—
—Doubles the life and service of your plugs—
—Saves you many times its cost on repair bills alone.

After 10 days' trial you wouldn't be without "For-dos" on your car at any price. But we don't ask you to take our word for this. We prove before you pay, that "For-do" will do just what we claim or you don't keep it. We take all the risk.

Saves Half on Spark Plugs
Makes Old Plugs Work Like New

To prove it, make this test: Pick out any 4 old cracked or worn out plugs you have thrown away and try them again with "For-do;" see how it will make them spark like new. Oil, carbon or grease have no effect on plugs when "For-do" is used. "For-do" is easily attached to any Ford in 3 minutes. No changes necessary in car or engine, no holes to bore—no bother at all. A child can put it on. Can't possibly harm engine, coil or plugs.

Indianapolis, Indiana,
March 26, 1919
G. E. Colby Co., Maywood, Ill.
Dear Sirs:
I bought one of your "For-dos" several weeks ago and it's the best buy I ever made for my Ford. I now use my old discarded spark plugs and save gas. Please write me your offer and price to agents. I can sell some of them.
Very truly yours,
A. L. HECKMAN,
608 N. LaSalle St. Indianapolis, Ind.

Send No Money Just This Coupon

Just write your name and address on the coupon—tear off and mail today. We will send you "For-do" complete, post-paid, ready to attach. Use it 10 days free. At the end of this trial, if you find it does everything we claim, and you want to keep it, send only $3.00. If you are not pleased, just say so—mail it back, and no charge will be made. We take all the risk. Send the coupon today.

The LAUSON Wins Again

at Delavan, Wisconsin

The LAUSON Transmission is fool-proof. Even an inexperienced operator cannot strip the gears. All gears are enclosed in a dust-proof case and operate in bath of oil.

James Murphy, Manager of 1600-acre Tilden Farms, ordered a LAUSON after watching the operation of 26 tractors in a competitive test.

The LAUSON FULL JEWEL TRACTOR did not make a stop for adjustment of any kind from the crack of the pistol to the finish of the Delavan Demonstration.

The reasons for this performance are evident in its construction—its full jewel movement with 24 roller and ball bearings, its dust-proof construction, its gears running in a bath of oil, and the practical agricultural experience incorporated in its design.

Full details on request.

Pruning and Staking Tomatoes

By S. S. Rogers

The practice of pruning and staking tomato vines in California is one which has been carried on in a small way for a considerable period of years. In the states which have considerable rainfall during the growing period of the crop it is usually customary to stake up the vines. This is done primarily to keep the tomatoes from becoming spotted by the earth which is splashed up by the rain and to prevent rotting which is often caused by the tomatoes resting upon the damp soil.

In California where practically all of the tomatoes are grown in the absence of rain this custom is practiced under two conditions. When growing for the early market it has been found that the tomatoes will mature slightly earlier than when the vines are allowed to grow on the ground. It also adds to the efficiency of picking and under certain conditions a larger crop will be produced than when staking is not practiced. By staking it is possible to have the plants much closer together than it otherwise would be, and as the grower receives his highest price for the earliest tomatoes many more plants will be grown per acre where the vines are closer together. It is sometimes customary to stake tomatoes when growing on a small area and especially for the home garden.

There are several methods used for staking the crops, the most common one being to place two stakes about 14 feet apart and three and one half to four feet tall about every 12 to 18 feet in a row. Wires are then strung on the stakes, having the lower from one to two feet from the ground and the upper three and one-half to four feet from the ground. The end stakes should be braced securely as there will be considerable weight on the wires. As the vines grow they are trained to some extent along the wires but normally this entails little extra work.

Several experiments have been carried on upon pruning tomatoes in California, but so far as the writer has observed no material results have been shown. The pruning has been done at several different stages, starting when the plants have been in the fields a few weeks and pruning throughout the season. Under normal conditions it would seem inadvisable to prune.

How to Get Rid of Ants in the House

As long as household conditions are such as to attract ants, measures for getting rid of the insects will be of little value. The first step in freeing a house from these pests is, therefore, to clean up all food that may be scattered about and keep food supplies which may attract ants in ant-proof metal containers, or in ice boxes. Cake, bread, sugar, meat and similar substances are especially likely to attract the insects. The use of baits is not recommended because of the danger that these will serve merely to draw more insects into the house and thus actually to increase the nuisance. Where it can be safely used, however, a syrup poisoned with arsenate of soda has been found effective. The formula for this syrup is one pound of sugar dissolved in a quart of water, to which should be added 125 grains of arsenate of soda. This mixture is boiled and strained and on cooling is used to moisten sponges which are placed where they can be reached easily by the ants. The insects collect the syrup and convey it to their nests, so that the whole colony is ultimately poisoned. Although this method has been found effective, as has been said, it should be remembered that the arsenate of soda is poisonous to human beings and to animals as well as to ants, and that its use must be safeguarded with the greatest precautions. When the ants can be traced back to their nests and these are in accessible places, it is possible to destroy the colonies by injecting with an oil can or small syringe a little bisulphid of carbon, kerosene, or gasoline into the nests. All these substances, however, are inflammable and precautions must be taken, therefore, against the danger of fire. Though the common garden or lawn ants which build their little crater nests around houses are distinct species from the true house ants, they may find their way into the house. Their colonies may be destroyed by drenching the nests with boiling water or injecting a small quantity of kerosene or coal oil into them, or, where large areas are affected with a very strong soap wash prepared by dissolving any common laundry soap in water at the rate of one-half pound to one pound of soap to a gallon of water. Another method is to inject bisulphid of carbon into the nests, the quantity of the chemical depending upon the size of the nest. After the bisulphid of carbon has been injected, the entrance to the nest should be closed by the foot in order to retain the chemical, which will then penetrate slowly through the underground channel and kill the ants. Although its fumes are disagreeable, they are not poisonous to man and the higher animals.

Condition of California Field Crops

As reported by the federal bureau of crop estimates:

The condition of Indian corn is two points lower than we reported a month ago. The forecast given of 2,923,000 bushels is on the basis of the entire acreage being harvested for grain.

The average yield of wheat per acre is sixteen and a half bushels which is one and a half bushels better than last year. The increased acreage and the better yield per acre brings the total production up to 13,348,000 bushels, which is an increase over 1918 of 5,758,000 bushels—certainly a very substantial gain. The quality, too, is better than last year.

Oats show up better than was reported a month ago when it appeared that the harvest would yield 5,712,000 bushels, and our forecast is for a slight increase in production over that of last year.

Total production of barley shows a falling off from last year's crop of very nearly three millions bushels, this by reason of decreased acreage.

In the Delta region Irish potatoes are looking well but in other parts of the state owing to lack of moisture they have declined in condition with the result that the forecast is 180,000 bushels less than a month ago.

Sweet potatoes have suffered somewhat from shortage of water and the condition of the vines is eight points lower than July 1 and the forecast is for 77,000 bushels less than our forecast made a month ago.

The condition of the rice crop has not changed since our last report and our forecast based on the same acreage is the same as made July 1. The outlook now is for a production of over eight and one-half million bushels.

There is about the same acreage of tame hay as last year, but less of wild hay. The condition of the crop, taken as a whole (alfalfa included) is not as good as on July 1, our estimate being 182,000 tons less than at that date. The estimated crop at that time was 4,530,480 tons.

As would be expected at this season of the year the condition of pasture is not as good as reported July 1.

Hops are looking well. All indications point to a larger production than last year.

Cucumbers and melons may be fed by pouring liquid manure into holes near the plants.

INVESTIGATING COTTON IN ARIZONA

Dr. T. H. Kearney and W. G. Wells, of the United States department of agriculture, bureau of plant industry, have been making a tour of the Salt River Valley of Arizona to study the Pima long staple cotton as grown by the valley farmers. They were accompanied by S. H. Hastings, superintendent of the government experiment station at Sacaton. Dr. Kearney was very largely instrumental in the development of long staple cotton as grown in America. It was under his direction that the cotton has been grown from the first plantings of Egyptian seed nearly 20 years ago. Mr. Wells for the past five years has been engaged in selecting seed plots of the best fields of Pima cotton. His work has prevented the deterioration of the Pima cotton and is resulting rather in a constant improvement. Mr. Hastings is doing some valuable work in determining the proper distance for spacing the cotton plants. They were accompanied by a considerable number of cotton growers who were thus enabled to profit by their knowledge and experience.

YEARBOOK OF 1918

The history of American agriculture is well depicted in the Yearbooks of the department of agriculture. Since 1862 these volumes have been appearing and giving a mass of statistics as to farm crops and farm animals. In addition the books have contained reports of the secretary and of the various divisions or bureaus, as well as a series of articles touching upon various agricultural practices and problems.

The last Yearbook is rather later than usual in appearing, having just been received. Amongst the formal letters written by specialists there are: "Black Stem Rust and the Barberry," "Cattle Loans and Their Value to Investors," "Better Poultry Through Breeding Associations," "The Old and the New in Corn Culture," "Drainage Movement," "Rabbit Growing," "Dairying," "Rye," "Home Mixing of Fertilizers," "Effects of War on Seed Industry," "Electric Light and Power from Small Streams," "Live Stock Reconstruction," "How Weevils Got Into Beans," and dozens of other helpful short articles. Their shortness is remarkable when compared with some of the former reports which have aimed to contain full information on each topic touched. Then about a third of the book is given up to statistics of crops. The book is invaluable and every farmer should secure it. When ordered from the government printing office it costs one dollar, but a hint to Cultivator readers is to write to the congressman of your district or to one of the senators, and it will probably be sent without cost.

RICE GROWERS MAY SHOOT DUCKS

Rice growers will have some relief from depredations of wild ducks. President Stephens of the California Rice Growers' Association has received wire from the biological survey at Washington authorizing him to issue permits to kill ducks in rice fields to rice field owners, their immediate families and bona fide employes. This permission was not given until a month later last year after strenouus work by the rice growers.

The permits must be issued with the same stipulation which went with their issuance last year. The ducks can not be sold, but in case of a surplus they may be shipped to hospitals, orphanages and other charitable institutions.

1918 COTTON CROP WORTH $2,067,000,000

The 1918 cotton crop, lint and seed, was worth $2,067,000,000 to the producers. This is about three times the value of the cotton crop of 1914 and is twice the value of the crop of 1913, which had the highest value of record. The computation has just been made, at the close of the cotton year, by the United States department of agriculture, bureau of crop estimates, based on average monthly prices received by growers and on monthly marketings.

ANTELOPE VALLEY FAIR

"Antelope Valley will hold its second annual fair at Lancaster, Septembr 17-20. The management writes:

"A large display of products is assured at this time and outside competition for the prizes on blooded stock will probably be very keen. In 1917 most of the prizes on hogs and cattle were won by local exhibitors but this year they will have to step high for their honors as entries from outside breeders are coming in to the secretary in great numbers.

"A new idea in building will be carried out on the grounds, and probably the main feature will be the "Alfalfa Palace" which will be a structure 50 feet by 100 feet constructed of baled Antelope Valley alfalfa hay. In this building will be concessions and a large dance floor.

"Those intending to visit the fair would do well to make hotel reservations early and the Fair Association advises all who can to bring their auto camping equipment. A large camping ground has been secured where there is plenty of shade and artesian water.

"Come to the Antelope Valley Fair!"

SHORT CROP OF BEANS

All beans will be a short crop this year, Limas showing the greatest reduction in acreage and yield. The bureau of crop estimates says:

The condition of Lima beans on August 1 was only 47 per cent of a normal, a decrease of 12 points since July 1 and on a decreased acreage promises a total production of not over 700,000 sacks compared to 1,545,000 sacks in 1918. Orange County where the irrigation of beans is but little practiced shows very poor condition. Ventura will probably produce about two thirds of the crop.

Beans other than Limas are considerably better in the Sacramento and San Joaquin Valleys than in Southern California where lack of soil moisture at planting time has resulted in a rather spotted and poor condition. On August 1, the condition was about 73 per cent of a normal compared to 82 on July 1. With more than 30 per cent decrease in acreage this poor condition warrants a forecast of only 5,353,000 bushels for all beans including Limas which is only 62.4 per cent of the total production in 1918.

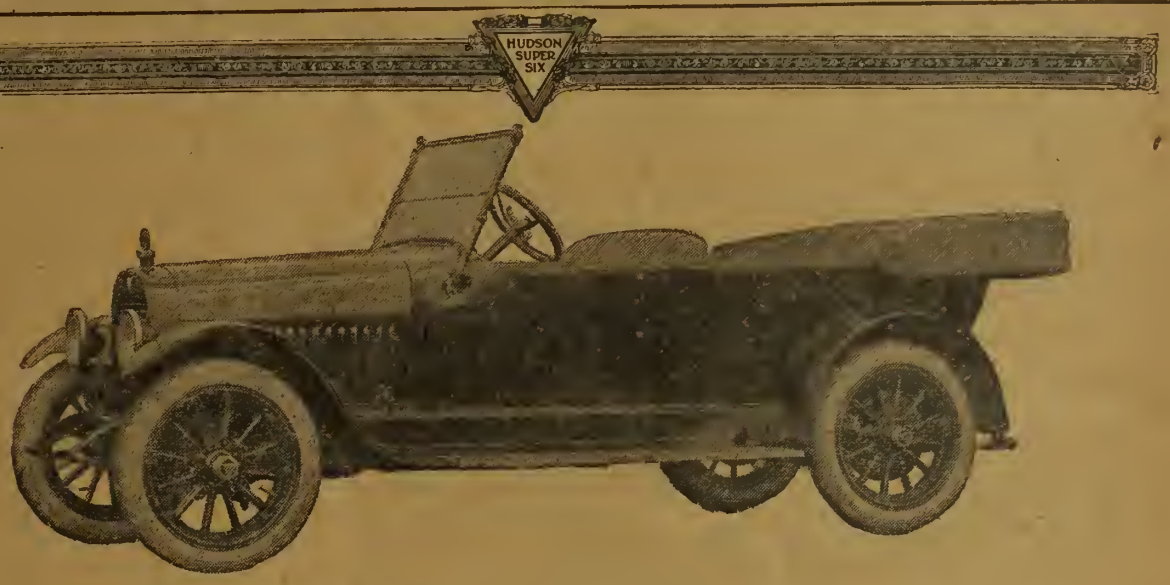
PLANT IRIS NOW

Iris should be divided and set in new locations now. The tubers send out their feeding roots during the fall. In later transplanting these roots are destroyed and a new set must be produced. Because iris are so hardy they will live if moved at any time, but for full bloom next spring, which is what we want them for, they should be planted now.

SLOW MUSIC

Have you ever been stopped by a gent
on a bike? I have!
Who asks for your name, address and
the like, I have!
Have you ever been told to drive to the
pound
Where your auto is chained to a pole in
the ground?
Have you cussed and abused every copper
around? I have!

Have you ever been told by the Cop, "It's
too bad?"? I have!
"As far as I go, you are innocent, lad!"
Some salve!
Have you ever been told by the Judge
when you plead
To make a deposit before you are freed,
Have you ever resolved, NEVERMORE,
you would speed?
I have, NOW!



60,000 Earlier Hudsons Foretold This Super-Six

Qualities That Men Had Predicted Would Make It the Unrivalled Car Have Now Been Realized

Everyone knows Hudson Super-Six history. It is written in the official records of some of the greatest endurance and speed tests known. It is told in nearly every locality by those who know how performance reveals quality.

But its greatest fame lies in the appreciation that thousands of owners hold for it.

You have heard Hudson owners predict its ultimate achievements. They have praised their cars and yet always they have said that a greater Super-Six was inevitable.

Hudson Evolution Came Naturally

Let the reader review the past four years of motor history. The Super-Six was a distinct step ahead in motor designing. It added 72% to power without increased weight or complications.

Its principle was new. Vibration had been minimized. Performance had been increased.

That first Super-Six revealed a development not possible to any other type. It foretold the Hudson we now offer.

Each Year Marked Some Improvement

New Hudson models are not mere changes in body design. Such attractiveness is not overlooked. The main effort has been to increase endurance, to free it from the faults common to all cars.

Easier starting, more reliability of performance, freedom from mechanical attention, a safer, more comfortable and more economical car has been the aim.

Each added quality has been proved in a thousand ways. The speedway, road racing, mountain climbing, trans-continental touring at express speed, did their part. Spectacular records were established, but long after details of the world's fastest mile for a stock chassis, or the double run from San Francisco to New York and return, had been forgotten by the public, Hudson engineers continued to profit by the lessons learned in those tests. Subsequent models showed the result.

Such a car would have been impossible without that experience. We did not enter racing to win prizes but to learn how to build a better car.

Sales Lead All Fine Cars

Like the constant champion it proved to be on the race track, Hudson sales exceed those of any other fine car.

More Hudsons are built now than ever before. A month's output now is as great as was the first four month's production of the first Super-Six.

Sales demand, though has always been ahead of the supply. That shows how motordom regards the Super-Six.

When will you make it your choice?

(1086) **Hudson Motor Car Company** **Detroit, Michigan**

BALING HAY

The department of agriculture is issuing Farmers Bulletin 1049, "Baling Hay," in which types of presses, compresses, condition of hay for baling, operatiug the press, and other points are given. This bulletin aims to help the hay grower solve some of the problems that arise In connection with baling hay; to decide whether to buy a press or depend on custom balers, to select the type of press best suited to his needs if he buys, and to settle to best advantage questions in farm practice that determine efficiency In the setting up and operation of a hay press.

Is $29.60 Additional Profit a Year Per Cow of interest to you?

Is an Additional Daily Gain of Approximately Five-tenths Pounds in Fattening Hogs of interest to you?

Is there a Lot of Roughage now on your Farm Being Wasted Just Because It Is Not Palatable?

You can make this additional profit; you can get this increased pork production, and you can turn what is now waste into profit by using that great Conservation Food,

Strong Show of Live Stock at Sacramento

By R. P. Royce

ADVANCE information indicates that the 1919 California State Fair to be held at Sacramento, August 30 to September 8 will register distinct progress over any previous fair.

In no department is registered greater advancement over former years than in the live stock division. The growth of the pure bred live stock industry in this state during the past year has in many respects been phenomenal, and the extension of the industry is reflected in this year's entries made by new exhibitors.

The show of dairy cattle at the California state fair has come to be regarded as the most important held in the West. This year the show promises to reach a higher point than ever. It is perhaps true that during certain years each of the breeds has been represented in greater numbers than will be seen this year, but the statement can be ventured that at no other fair has there been a better balanced exhibit of the four leading breeds.

Preliminary entries indicate that there will be over 100 Holsteins in the show, 89 Guernseys, 86 Jerseys and 65 Ayrshires. And among the entries in each breed are a gratifying number of breeders who are making their initial show.

The show of beef cattle will be up to the standard of former years. The interest in pure bred beef cattle is tremenduous, and in some respects the year just closing has seen a wider expansion of the business than can be claimed by any other branch. Many new herds have been established and just as soon as these new herds get under way the annual show at Sacramento will put California at the top. At least two Shorthorn herds will make their first exhibit at Sacramento this year and one new Hereford herd will be on hand.

The exhibit of milking Shorthorns will be one of the features of the live stock department. Several strong herds will have entries.

The swine show promises to touch the high point of the fair's history. All the leading breeds, save one, will be found in the pens. Secretary Paine states that accommodations for swine will be taxed to the limit but that all will be taken care of.

Twelve of the leading Berkshire herds of California and Nevada have entered 150 head. The Poland-China division shows the heaviest entry list of any breed, over 300 head having been entered to date. The Poland-China breeders have made many notable additions to their herds and it is expected that the keenest sort of competition will be staged. About 30 herds will compete. Crowding close on the heels of the Poland men, 23 exponents of the Duroc-Jersey will be out with over 200 entries, and if every breeder makes good his claim the Duroc show will take high rank.

While numerically it is not possible for the Chester White breeders to make as large exhibit as the breeds just mentioned, a fine showing is forecasted.

The sheep show at Sacramento has never been developed to anything touching the importance that the sheep industry is entitled to. California is a great sheep state and all breeders should make it their business to show. This year's exhibit will be decidedly stronger than the 1918 show.

Visitors at this year's fair can be assured of a real draft horse show. All breeds will be seen and the quality promises to overtop any former show. Several new stables have entered and it is rumored that a few sensations are to be uncovered. The show of heavy horses will be a rebuff to those who figure the horse about to be relegated to the scrap heap.

In line with the heavy horse division the show of light horses promises a substantial increase.

FALFADALE FARM DUROCS

B. H. Wilkinson has just returned from a buying tour in Middle West Duroc circles. He bought the one boar that he went to see, Great Orion Sensation Jr. This fellow is an underyear pig, but he has developed size, smoothness and symmetry of conformation that will surprise the eye of the expert. It is no secret that Wilkinson had to put down $2000 to bring this young hog to California, but knowing that his sire Great Orion Sensation is the most talked of hog of the day, and believing that he has secured his very best son, there are no regrets as the price paid. Among others Mr. Wilkinson also selected a junior yearling sow out of same dam as Great Orion Sensation, Jr. These will be seen in the Falfadale show herd at the Southern California fairs. The Falfadale herd is rich in the blood of Giant Orion, Grand Golden Model and the Defenders and Pathfinders. Visitors at the ranch will find much of interest in the strings of young boars and gilts, and bred sows.

John M. Bernstein and W. L. Haag & Son

announce the

Banner Sale of Big Type Poland-Chinas

Wednesday September 17, 1919 Hanford, Calif.

In this sale the breeders will have the opportunity so long sought, that of securing strictly *Big Type* sows bred to strictly *Big Type* boars. Boars whose fame has preceeded them and whose blood is now demanded by the foremost Poland-China breeders.

The Yankee, Jr.
is a magnificient son of THE YANKEE, William Bros., "King of the Breed" boar of which Col. H. S. Duncan says; The Yankee is, in my opinion, age considered, the nearest my ideal I have seen in twenty-five years."

Sows bred to these two remarkable young boars will add prestige to the herd of every Poland-China breeder and should meet with approval by every one interested in

BIG TYPE POLAND-CHINAS

Young Jumbo, the senior Haag sire, and whose gilts, sold open, topped the last two Hanford sales, and President, the boar who put John Bernstein to the front in Polands, will assist The Yankee, Jr. and Lendorris Liberty Bond in making this the

BANNER SALE OF THE YEAR

Lendorris Liberty Bond
a son of that phenomenal sire Liberty Bond and out of Hercules Lady 4th, full sister to Mary Pickford, sold for $1950 in the last Glover sale. $2000 was refused for Hercules Lady 4th and a price of $20,000 placed on Liberty Bond.
Lendorris Liberty Bond tipped the scales at 315 lbs when seven months of age and not fat.

Write either breeder for catalog and further particulars.

This offering doubly immuned. H. M. Bernstein, Auctioneer

WILL INVESTIGATE "SOFT PORK"

The problem of soft pork is one of the most important now confronting the hog growers of the United States. That a more definite knowledge of this question might be available congress has appropriated $20,000 to be used by the United States department of agriculture for a study of this question. It is the intention of the department to make a study regarding the effect of feeding both peanuts and soy beans to hogs. Possibility of hardening hogs fed on these feeds will be looked into to determine the maximum amount that may be fed in conjunction with other feeds and still produce hard pork. The department hopes by close study, covering a large number of hogs and several years' time, to determine some facts and solve some problems that are now facing the American farmer, because of the reduced price paid at the central markets for hogs supposed to be soft. Many of the agricultural experiment stations will cooperate closely with the department in these studies.

CAREFUL HANDLING WILL REDUCE HOG LOSS

Hot weather occupies a leading position in the hogs' calendar of horrors. During the season when the sun is at its best, hogs suffer unless protective precautions in the way of plenty of shade and a sanitary wallow are provided. Particularly in the case of shipping hogs by rail is mortallity heavy during the season when the mercury is rising.

When it is necessary to ship fat hogs to market at this time of year, such precautions as icing the cars. shipping at night as far as possible on special stock trains, and exerting every effort to expedite the movement of the live stock to the central market so that the animals suffer only a minimum of shrinkage in weight and discomfort during their railroad journey, should be practiced.

It is advisable to equip each car which is within about one day's trip of its destination with approximately 500 pounds of ice suspended at even intervals in burlap sacks by means of stout rope from the ceiling of the car. The motion of the car wil cause these sacks to swing to and fro so that the hogs are continuously showered with cold water during their market trip, until the supply of ice is exhausted. In case it is impossible to secure an abundance of ice, the stockman should bed his car with three or four inches of sand, which should be well wetted before the train starts and, if possible, it should be again moistened in transit.

The heat discomfort of hogs on the farm may be alleviated by locating the hog quarters amid plenty of shade and providing a substantial, permanent hog wallow made of concrete of a size adequate for the requirements of the herd. Arrangement should be made for draining the wallow at frequent intervals and adding fresh water to maintain it in a sanitary condition. If the wallow is constructed in an unsheltered position, a simple sunshade may be made of straw or boughs laid over a framework built about four feet above the wallow.

One advantage of the warm weather season is that, ordinarily, it provides an abundance of green feed and pasture crops for the hogs to harvest in the self-serve way. Every hog raiser should make maximum use of all available green feeds in the summer ration, as such materials are not only nutritious and fattening during the high temperature season, but they also are inexpensive material for the making of profitable pork. Furthermore, the porkers gain necessary exercise in rustling the green feed.

In the annual recording contest conducted by the American Hampshire Record Association, which begins January 1 and closes July 20, 42,894 pedigrees were registered. Iowa ranked first with 9532 and California was 13th with 580. California breeders represented in the published list were: Tom M. Bodger, Gardena, 16; Conejo Ranch, Newbury Park, two; L. A. Denker, Saugus, 58; Dr. F. Farrow, Redlands, nine; F. V. Gordon, Perris, 14; Chas. E. Shattuck, Los Angeles, 30; I. F. Stone, Ethanac, two; Francis T. Underhill, Santa Barbara, 129; total 580.

FILLS THE SILO — MAKES ALFALFA MEAL — CUTS DRY FEED

The ACME Cutter

PRODUCES SILAGE OF THE FINEST QUALITY.

It is convenient to operate. Its compact, rigid steel frame and 3-bearing cutter shaft practically eliminate vibration. This construction is found in no other cutter and makes the Acme the light-running power-saving machine it is.

The Acme is absolutely reliable and safe—the most durable feed cutter and silo filler made.

COMPARE THE ACME WITH OTHER CUTTERS. Send for our Acme Catalog. Study it. Your own good judgment will convince you that the best cutter to own and use is the Acme.

LODI, CALIF.

Have You Heard of the Great GOLDEN STATE KING?

Sire of size and quality Poland-Chinas, The high backed, deep sided, good footed, straight legged and right up on their toes, two good ends, good color and fine coated, long and tall, the kind that grow large, easy feeding and prolific, the fashionable kind.
Every one who sees them says they are great.
See them at the fair and you will say the same.
Some of them will sell at the breeders sale at Lodi, September 19, 1919.

W. A. Young Lodi, Calif.

Blue Valley Model

Our junior herd boar comes from a long line of strictly big type breeding. Individually he is all we could ask. We sell big type Poland-Chinas that give satisfaction. Write

Poland China Ranch H. B. Peake, Mgr.
San Bernardino, Calif.

Big Type Poland-Chinas

that are strictly big type. Big type sires—big type dams produce for me real big type animals. Usually sold down close but frequently have an exceptionally good one for sale. It will pay to keep in touch with me.

Eugene Miner Lodi, Calif

FUTURE HERD SIRES

A better lot of young boars, future herd leaders, cannot be found. Sired by Golden State King and Big Bone Bob. Breeders who have seen my young Poland-China boars are unanimous in pronouncing them excellent prospects. They are high backed, big boned and have plenty of stretch. Write me for description.

J. F. Lehman Lodi, Calif.

Extra parts are always available without delay for standard advertised machinery. This class always found in the California Cultivator.

STOCK COMMENTS

By A. L. Spellmeyer

Every one bas seen a dog chase its own tail. The railroad men are asking for a raise of wages to meet increasing food costs. Food cost has increased greatly in order to run the railroads, pay higher wages, employ more men, etc., under government management. Where will the end be?

It has not been long since when we shipped a steer or a cow from Arizona to California for under $100 per car, or about $3 to $4 per head, including all expense. Having just completed a trainload shipment into California the advances figured are recent. Hardly an agent can give the rate or the tariff. Diversion charges are made necessary in many cases, feed charges are almost extortionate, handling is often rough and death loss results. Rates advanced 25 per cent to start with; war tax and other charges mount it up.

To ship the kind of cattle which formerly cost in freight and expense $4 per head now costs about $7.

Usually a steer is shipped several times during its career; as yearling to the steer ranges, and generally from the steer range to the feeder and thence from the feeder to the slaughter pens. The ordinary steer has about $10 of his value due to freight charges, and considering meal and feed often twice that. Then the products are shipped and cost more money. It is a certain conclusion that the raise in railroad rates has been the cause of 25 per cent to 35 per cent of the raise in food products. To be just to the railroads they don't waste the time they used to formerly fooling around loading, etc., but start, and when they start they travel. The men are usually pleasant and the agents obliging.

Beef is now 10.50, going up, with 15 cent winter prospects, but—during the past 90 days beef has dropped in California from 14 cents live weight to 9 cents for steers, or about 5 cents. On a 1200 pound steer this means $60. It means a great loss to cattle feeders.

These steers cost on an average $35 to $40 as yearlings. The steer man ran them two years and received from the cattle feeder about $95 for them. The cattle feeder spent $35 to $50 making them fat and they cost a total of probably $140, or over 11 cents. To sell them at nine cents means a definite loss of $25 or more per head. There has been no lowering in the cost to the consumer, although the decline has been 50 per cent more than the producer received for the yearling originally.

Now the tendency is for higher prices. It couldn't be any other way Of the 30 feeders who finish the 60,000 beef steers in this part of the Southwest not a third intend to feed again this year without definite price guarantees from the packers. This can only mean two things, either there will be a shortage of winter beef or the packers must feed cattle for themselves on a large scale as they have been doing in a smaller way.

SACRAMENTO-YOLO COW TESTING ASSOCIATION

The roll of honor of the Sacramento-Yolo Cow Testing Association for July shows 59 cows giving fat production for the month of over 50 pounds. The highest record cow is a Holstein belonging to F. W. Kiesel which made 71.1 pounds fat. This cow also held the record for greatest production of fat in one day, 2.52 pounds. The second highest record was held by a Holstein owned by J. Herzog, 70.3 pounds. Mr. Kiesel had 19 animals that tested above the 50 pound mark; Mr. Herzog had five. The record for daily production in milk went to a Holstein owned by Mr. Kiesel, which gave 70.7 pounds.

The cow giving the highest testing milk, 6.9, was a grade Jersey belonging to A. Krull. Mr. Krull also had the second highest test cow, 6.7, closely followed by a grade Jersey belonging to J. N. Dimmick, which gave a test of 6.5.

Two other cows showed butter fat test over 6 per cent, a grade Holstein owned by A. Pylman, 6.3, and a grade Jersey owned by A. Krull, 6.0. There were 26 other cows whose butter fat test came above 4 per cent. It is an interesting fact that of the 31 cows showing butter fat tests of over 4 per cent 29 were grades, but of the 59 giving total monthly fat productions of over 50 pounds 31 were registered animals and 28 grades.

CALIFORNIA DAIRYMEN TO GO EAST

Arrangements are being made for a special delegation of California dairymen to attend the National Dairy Show to be heid in Chicago, October 6 to 12.

Educational exhibits will be shown, featuring the necessity of dairy products in the maintenance of health and development of men, women and children. After viewing these exhibits one cannot fail to get a new vision as to the importance of milk and its products in their relation to the development and progress of a nation The latest equipment for farms, barns and creameries will be on display. Labor saving devices and new methods and means of handling all lines of business in connection with the dairy industry will be in evidence.

As to arrangements for attending communicate with Sam H. Greene, secretary California Dairy Council, 268 Market Street, San Francisco. California should send a large delegation to Chicago to represent her second largest industry in the state.

SAN FERNANDO DUROCS

San Fernando Valley has rapidly forged to the forefront as a Duroc breeding center. Some of the more pretentious breeding herds of today are the Ireland Ranch herd at Owensmouth, with the noted grand champion boar Cherry Volunteer 2nd at its head, Hewitt Brothers' herd at Van Nuys, the coming boar Top Sensation 1st in service; Elliott-Brant Rancho herd. Owensmouth, with the 630 pounds 16 months May Rose King, son of King Orion, doing service; W. Chas. Swett Ranch near Van Nuys; J. C. Craig, Owensmouth; L. R. Hitchcock, Van Nuys; also L. Leest, J. L. Stevenson, D. H. Pores, and C. M. Nance, all of Van Nuys. These last named herds are founded on the blood of the noted junior champion boar Orion King Gano.

A strong local breeders' association has been formed and a combination bred sow sale is arranged for a January date.

KLAMATH RIVER COW TESTING ASSOCIATION

Clarence V. Castle of the University Farm, Davis, sends report of the Klamath River Cow Testing Association, showing for the month of June 30 cows in the honor list, that is, with records of 50 pounds or better of butter fat. The honor cow with the record of 74.3 pounds of fat is from the herd of C. P. McBeth. In the same dairy were four other cows with better than 50. Other dairies on the honor roll were those of Sophie Blake, Paul Bravo, G. B. von Alvensleben, J. H. Weber, Victor Macfarlane, P. F. Peini, Rissighini and Marosoli, J. R. McMillan, Sero Del Ponte, V. M. Del Ponte and A. W. Green. The official tester for the association is Percy Helgested. The secretary is E. L. Lockwood.

WOOL BREAKS MONTHLY RECORD

The total amount of wool consumed during June was 55,000,000 pounds, grease equivalent, which exceeds that of any other month this year and is more than twice the amount consumed in February, according to the monthly wool consumption report just issued by the bureau of markets. June consumption represents an increase of six per cent over the amount used in May and 22 per cent over the amount used in April. Monthly consumption of wool bas increased steadily since February, which is said to indicate continued activity in the textile industry.

Total amounts of wool used during June, 1919, by condition, in pounds were: grease, 40,332,664; scoured 6,064,243; pulled, 2,452,985.

sissippi, on September 2. The election was ordered by the county board of supervisors after a petition asking for it had been presented by a group of citizens.

The results of this election will have much more than local interest, because the election may be the forerunner of hundreds or thousands of others in other sections of the country.

DIRTY MILKING MACHINES UNSAFE

"Unless they are kept in a clean and sanitary condition they are a menace to the quality of the milk drawn by them," says R. M. Washburn of the dairy division, University Farm, St. Paul. "To keep them safe they not only require thorough cleaning in warm, soapy water, with suitable brushes to reach into tubes and crevices, but they must be kept when not in use in some disinfecting solution. Yet to get results it is not necessary to buy expensive germicides; old fashioned chloride of lime will serve every purpose. This is made as follows:

Stock Solution

"Dissolve a 12-ounce can of chloride of lime (calcium hypochlorite) in three quarts of water; let settle, pour off the clear liquid and put it in a jug or dark glass bottle and keep tightly corked.

Working Solution

"Add one pint of stock solution to 100 gallons of water or one-half pint to 50 gallons, or smaller amounts in proportion. This should be kept 'alive' by the addition daily of stock solution at the rate of about one ounce to each 25 gallons of the working solution.

How to Use

"The teat cups and tubes should be plunged entirely into the solution and all pockets of air in the tubes emptied so that the water may come into actual contact with the walls of the rubber.

"To sterilize milk bottles, pails and cans, the same working solution may be employed and will be found generally more effective than the hot water method commonly used.

"The milking machine is a great help or a great hindrance to quality. It all depends on how it is handled."

SUNFLOWER SILAGE

Sunflowers have recently been tried out for silage. Mr. Ince of the North Dakota agricultural college states that it has a number of advantages which should make its successful employment in this way of great value. Namely, it is a plant which can be grown in northern latitudes and it is capable of yielding a large amount of succulent material for feeding purposes. Montana has led the way in a careful scientific investigation of the possibilities of this crop and the trials seem to indicate that sunflower silage is a palatable feeding stuff of excellent quality. In the summer of 1918 some sunflowers were cut and placed in a layer between corn in one of the silos at the North Dakota experiment station. The analyses show that the sunflower silage was considerably richer in protein than corn silage and nearly equal in the other nutrients. This is but one trial. The results of other trials are needed before any grand conclusion can be arrived at. A. J. McFadden of Neche, North Dakota, filled one silo with sunflowers last fall and fed it to beef cattle. He states that it is just as good as corn silage and the cattle like it.

HOW WE GET NEWS

The "n" comes from the chilly north;
The "e" from the east, they tell me;
The "w" comes from the golden west;
And the "s" from the south, you see.
So news that spreads from mouth to mouth
Comes from the north, east, west and south.—A. F. Caldwell.

Twenty years ago gasoline sold for eight cents a gallon.

And the butcher, when you bought a fifteen cent sirloin, threw in a piece of liver and some suet and tossed the dog a bone.

AYRSHIRES

AT PUBLIC AUCTION

The Preston School of Industry, Ione, California, will disperse its entire herd of registered Ayrshire cattle at public sale

Tuesday, September 16, 1919
State Fair Grounds
Sacramento, California

The herd was founded upon animals secured from some of the best known herds in the United States and Canada, and the original animals and the increase have been well cared for and handled in the School herd. The offering will contain approximately

60 Registered Ayrshire Cows, Heifers and Bulls

This will be a rare opportunity for the buyer wanting a few registered females or a good bull.

65 Registered Holsteins at Public Auction

Stockton, California

Thursday, September 18, 1919

From the well known, highly bred herds of

Henderson Company — Sacramento, Cal.

Bonita Stock Farm — Lodi, Cal.

The females in the sale are a richly bred lot, including a substantial number of A. R. O. cows and heifers and daughters of good record cows, and among them are a number of granddaughters and great-granddaughters of Pontiac Korndyke, King of the Pontiacs, King Segis, and other great bulls of the breed.

Except a very few unbred heifers, every female in the sale is either fresh or well along with calf

These cows and heifers are bred to such great bulls as King of the Black and Whites, who has the largest list of A. R. O. daughters of any bull on the Pacific Coast, King Pontiac Segis Inka, a richly bred son of King of the Pontiacs, King Lillian Walker Segis, son of King of the Black and Whites, Supreme Glista Pietje, and others.

Bulls in the Sale

The offering will contain an excellent selection of young bulls, some ready for service, by such sires as King of the Black and Whites, King Pontiac Segis Inka, King Lillian Walker Segis, Supreme Glista Pietje, and others of excellent breeding. This sale will be one of the real opportunities of the season for breeders and dairymen to secure herd bulls.

Every animal positively guaranteed to be a breeder

No animal in this sale is tuberculin tested

The sale will be held at DARBY'S BARN, corner East Jefferson and Pilgrim Streets, Stockton, California, where the cattle will be on exhibition two days prior to sale. You are cordially invited to come and look them over before sale day.

Catalog free on request to management.

Harold W. Rice, a prominent Hereford breeder of the Hawaiian Islands, who is now in California, has recently purchased from the University of California two yearling Hereford bulls. He secured California Prime Donald 2d sired by Hopeful Prince 2d, reserve champion at the Panama-Pacific Exposition, and out of Miss Sophia, one of the best producing cows in the University herd. California Prime Donald 2d is a full brother to John A. Bunting's herd bull California Prime Donald, grand champion at the 1918 California state fair. Mr. Rice also selected another son of Hopeful Prince 2d. During the past year Hawaiian breeders have purchased a number of California Herefords.

Manager E. Lovell of the Blackhawk Ranch, Diablo, reports the sale of four young Shorthorn bulls to Harold W. Rice of the Hawaiian Islands. It is believed that this transaction represents the first sale of California Shorthorns to the Islands. The four bulls sold were: Blackhawk Radium, by Roan Radium, the Blackhawk bull, and out of a Victoria dam sired by Village Knight; Blackhawk Beau, by Roan Radium and out of a Clara dam; Blackhawk Beau 2d, by Roan Radium and out of a Violet dam and one sired by Princely Sultan and out of a Lady Belle dam. The Blackhawk Ranch is one of the newer Shorthorn herds established in this state and the owners, Messrs. Easton & Ward, are to be congratulated on the above sale.

Halford & Hassler, Poland-China breeders of Manning, Iowa, have sold their boar Mabel's Jumbo to H. W. Hey of Polo, Illinois, for the record price of $18,000. The sale was at public auction. Mabel's Jumbo was sired by Long Jumbo and his dam was Mabel Tecumseh.

William Wrigley, Jr., of chewing gun fame, recently purchased the Poland-China boar The Clansman from L. H. Glover of Kansas City, Missouri for $15,000. The Clansman was sired by Grand Big Orphan, by Grand Master, and he is out of the sow, Kramer's Kind.

George Waltmeyer, a well known Duroc-Jersey breeder of Iowa, has accepted a position with the Conejo Ranch, Newbury Park. Mr. Waltmeyer will be in charge of the hog department.

Harvey M. Berglund, Dixon, has sold a yearling Duroc boar to J. D. Rowe & Son, Davis; a spring boar to C. W. Scott of Winters and a young boar to E. Rohwer of Dixon. Mr. Berglund, it will be recalled, recently purchased the entire herd of Durocs owned by Fred M. Johnson of Napa.

Owen Duffy, business manager of the Napa state hospital, has recommended to the board of managers that the institution establish a herd of registered Herefords. The Napa Holsteins have made an enviable record, and it is to be expected that the venture in beef cattle will be equally successful. In the event that a Hereford herd is established a precedent will be set for other state institutions, for, with the exception of the University, none of the various institutions have attempted to develop herds of pure bred beef cattle.

It is impossible to forecast the results of any public sale with a degree of accuracy, but there is every indication that one of the most successful Poland-China sales in the West this fall will be the one to be held by Haag & Bernstein at Hanford, September 17. Few boars have created more interest, or promise to be greater factors in the promotion of Poland-Chinas in this state, than The Yankee, Jr., a son of The Yankee, in the herd of John Bernstein; and Lendorris Liberty Bond, a son of the famous Liberty Bond, in the herd of W. L. Haag & Son. Recent Eastern sales indicate that there is a very strong demand for the blood of the sires of the two boars referred to. Many of the leading herds in the Middle West have sons of Liberty Bond and The Yankee at their head. The sows in the sale, that are bred to the two boars featured, represent all that is popular in big type breeding and will no doubt be appreciated by the breeders of this state.

A recent addition to the large herd of Poland-Chinas maintained at Lakeside Stock Farm, owned by Beckman & Sons, Lodi, is a junior yearling gilt by Bob's Equal and bred to Liberty Bond. It will be remembered that in a recent sale sows bred to Liberty Bond sold for an average of $823. Sherwood Beckman who has the management of the herd, writes that this new addition to the herd is extremely long, smooth, with a good back and especially good on her feet. He adds they will have a full show herd at Sacramento.

Duroc breeders will regret to learn that Donald H. Graham of Lancaster will be unable to show his Durocs at the state fair owing to circumstances over which he had no control. Mr. Graham has one of the top boars in this state and breeders were anxious to see him at Sacramento. The herd will be shown at the Los Angeles Live Stock Show.

Due to a number of unavoidable reasons the show of Mills' Berkshire Farm will not be out at Sacramento this year. Following a change of herdsmen it was decided not to attempt to fit a herd. It is possible however that the herd may be represented at the later shows.

R. J. Yates, who breeds Poland-Chinas on his ranch near Orland, has finally decided to show at the state fair. He does not expect to have out a full herd but will exhibit in the younger classes.

Frank E. Collier of Elsinore has at the head of his herd of Shorthorns the pure Scotch bull Orange Flash from the well known Diblee herd at Santa Barbara. Along with F. L. Hall of Perris Mr. Collier has made some recent purchases from a breeding herd in Arizona.

Secretary W. W. Van Pelt of the Southern California fair at Riverside is distributing the premium list for the seventh annual fair and live stock show which includes the dates October 7-11. Prospects are reported A-One for a big show in all departments.

CALIFORNIA BREEDERS SALES & PEDIGREE CO.,

C. L. HUGHES, Sales Mgr. Sacramento, Cal.

NOW IS THE TIME!

When your summer crops begin to ripen then is the time for a silo. A safe, sure and profitable means of preserving the full value of your summer's work. Much of the food value is lost when fed in the old manner. Take corn, for instance—the stalk is worthless when it becomes dry and 50 per cent of the blades and husks are lost in handling. Save the entire plant by putting it in a silo. Your stock will eat it to the last ounce. More nutrition, more milk, more profits.

Let a "SIMPLEX" take care of your stock. Don't eat up your profits by paying the usual "out of sight" winter prices for dry grain and mill feed. Fill a "Simplex" now and your feed worries are over. The

SIMPLEX SILO

is indestructible. Staves are of Douglas Fir and one piece—the height of the silo. This is a distinctive feature. No weak end-joints to leak and cause trouble. Hoops are made of new steel. Doors are of the two-way hinged type, air-tight and will not sag. The "Simplex" is fitted with the Crisell Tangent Top, which automatically keeps the Top in a true circle under all conditions.

Heavy galvanized cables are attached to top and are crossed diagonally to foundation anchor bolts imbedded in the foundation. This forms the SIMPLEX WINDPROOF INTERLOCKING ANCHORING SYSTEM.

Fill Your Own Silo

The PAPEC ENSILAGE CUTTER has a one-piece solid semi-steel frame. No wood or bothersome rivets to cause trouble. The Papec has six fans instead of the usual three or four. They are attached to the cutting wheel and "throw and blow" a steady stream of ensilage. Papec cutters require less power to operate and will elevate to the top of the highest silo, operating at their low speed of 600 to 700 revolutions per minute.

The Papec is a money-saver and a money maker. We guarantee it to do better work at a lower upkeep cost and operating expense than any other.

The "Simplex" Silo and the Papec Cutter are two money makers. They are permanent investments and will yield big returns each year. Send for our descriptive folders.

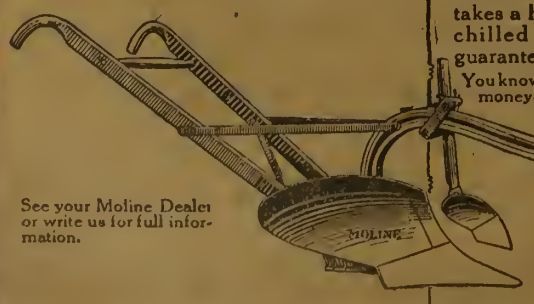
MOLINE CHILLED PLOWS

With a Money-Saving Guarantee

We will replace, free of charge, f. o. b. factory or branch house, on receipt of broken parts, any Moline Chilled Moldboard, or Moline Malleable Frog, broken in actual field use.

We can do this because Moline Moldboards have a soft, tough, greyback, which resists shocks and strains, yet the face of the Moldboard is glass hard and takes a high polish. No other chilled plows have such a guarantee.

You know this guarantee will save you money—insist on getting the better guaranteed Moline Chilled Plows.



See your Moline Dealer or write us for full information.

Moline Plow Co.
Moline, Ill.

Questions and Answers

Questions to be answered in this department should be received at the office one week before reply is expected. Write plainly on one side of the paper and sign full name and address. Unsigned communications receive no attention.

Slobbers

My young rabbits have what I am told is slobbers. I can find no cankers in their mouths but they seem to slobber a clear secretion which causes tiny sores under their necks and on their front paws. They just seem to waste away and die. One man told me to put salt in their mouths. I have tried that and also mouth washes and have washed the necks. One mother got it, but I saved her. Have been able to save only a few of the younger ones. I have comfortable pens under a big oak tree. They have plenty of sunshine but shade during the heat of the day. They have a great variety of feed, always barley or alfalfa hay, a moderate amount of fresh greens, corn, weeds, vegetable tops, string beans, etc. I do not give them too much so it does not spoil in the pens. Until recently I did not give them salt. Now I have ground cattle salt in the pens but only a few eat it. The trouble seems to be spreading and I am afraid I may lose some of the big rabbits. Am sure some good rabbit articles would be of interest to your readers for many are raising them now.

Slobbers is a disease caused usually either by injudicious feeding or weakly constitution. Well grown youngsters from vigorous mothers seldom are troubled. One cause of sickness may be inbreeding. The most effective cure, once the disease appears, is one tablespoon each of powdered ginger and chlorate of potash added to eight ounces of water. This is well shaken. Give teaspoon doses twice daily for a week and feed on bread soaked in milk, crushed oats, or hay. Do not feed roots of any kind nor any green succulent feed.

Walnut Tree Overfertilized

Will large English walnut tree be likely to suffer if chicken park is built around it? The leaves on tree shrivel up just as though it had too much strong manure. It seems rather that it would help the tree.—Subscriber, Long Beach.

It might be that after several years of parking a large number of chickens around a walnut tree it might suffer from overfertilization. However, with an abundance of water and thorough working of the soil with the admission of air we believe such parking can only be beneficial. A tree on such enriched land makes rapid growth and consequent heavy demands for water. This may be the reason for the apparent suffering of the tree at the present time, lack of irrigation and cultivation.

Wire Worms

The last two seasons our potatoes have not been fit for use. As soon as they are out of the ground something seems to eat the vine, as it turns yellow and the growth becomes stunted. The last crop was bothered too with a worm in the ground that ate the potatoes. There were so many of these worms that the potatoes are almost unfit for use. If you can give me any information as to way of treating these potatoes or vines I will greatly appreciate it. Also is there any difference in planting potatoes in the same spot for two succeeding years?—Subscriber, Oxnard.

This question was submitted to D. F. Reichard and he answers that presumably the Oxnard subscriber is having an experience with wire worms which are very difficult to eradicate. The only suggestion with wire worm infested land is to plant other crop or let land lie fallow until the worms have starved out.

Melons Dying

A Buena Park subscriber brings melon vines which wilt and die so far as can be seen without any reason They were submitted to Prof. Fawcett of the State University and he suggests that it is possibly due to fusarium wilt.

Dried Rabbit and Chicken

Can you give any information regarding drying of the meat of rabbits and chickens, that is, something similar to dried beef?—Subscriber, Los Angeles.

This question was referred to Arthur W. Christie, University of California, and he replies:

"After the rabbit or chicken is cut into pieces and cleaned it should be soaked over night in a weak brine. Then remove and smoke for 24 to 36 hours. Then dry over a stove, in the sun, or in an evaporator. If dried in the sun it is desirable to sprinkle the meat with a little pepper to repel flies. A small smoke box can be made out of a barrel or dry goods box. Corn cobs are the best substitute for hardwood fuel. Soft wood should never be used."

Fumigation Marks

A subscriber at Santa Barbara sends lemons seriously marked with large reddish brown spots with chocolate colored margins, while around the spot the partially colored fruit shows a deeper green. No information is given as to former treatment of fruit or tree, but our guess is that these trees have been fumigated and these spots are indications that weather conditions were not favorable and a strong dosage of gas has been the cause of the spots. Plainly they are the result neither of work of fungus or insects.

In sending specimens for determination of trouble subscribers should give full particulars of past treatment of tree and fruit.

To Acquire Water Right

I have 40 acres of land in Tehama County, the nearest part being 300 feet from the Sacramento River. I am writing for information concerning a government right to use water from this river for irrigating purposes. I will need about 800 gallons per minute. What will the cost be for such a right? How shall I go about it. Please give me all the information you can?—Subscriber, Huntington Beach.

This question was referred to W. A. Johnstone of the State Water Commission and he writes:

"Replying to the inquiry of your subscriber about how to proceed to acquire a right to the use of water from the Sacramento River for the use of his 40 acre tract: It will be necessary for him to proceed in the same way as for the use of any other water which may be appropriated. He must file an application with the state water commission, forms for which may be had on application, setting out briefly the amount, use, etc. A statutory filing fee of $5 must accompany the application, with a map showing the location of point of division ditch or pipe line, etc. In the case mentioned the principal obstacle to be surmounted is the acquisition of a right of way over the intervening 30 foot strip of land between his land and the river, and a pump site. Such a right of way is a legal necessity and as all of the land there is in private ownership it is a matter of negotiation with the owner.

"In 1911 the legislature passed an act purporting to give to an individual irrigator, on the grounds of public necessity and convenience, the right to condemn a right of way for irrigation ditches and pipe lines. The act was sustained by the lower courts but was declared unconstitutional in the appellate court in what is known as the Gravelly Ford case. An effort was made to reenact this law during the last legislature, but it failed probably because of misunderstanding of its purpose. The bill was approved by the members of the state water commission, and it is to be hoped that such a measure will later become a part of our law."

Legal Queries

Louis B. Stanton, attorney, 243 Wilcox Building, Los Angeles, will answer legal queries in this department.

Immediate mail replies cannot be given except where fee to Mr. Stanton is paid. When replies are wished in Cultivator address query to 115½ N. Broadway, Los Angeles.

Judgment

B obtains a judgment against A. A lives on property which is supposed to belong to him, the record title of which is in C to whom it is assessed. A, however, pays taxes on the personal property which is mortgaged. Can B levy execution on any part of the crops in payment of his claim? A is married and has a family living on the property.—Subscriber, Chowchilla.

If you have proof that the property belongs to the judgment debtor, execution may be levied upon this property, at which time the party who claims the property as his will undoubtedly put in a third party claim to the sheriff, and if you wish to persist in your execution sale, you will then be required to put up a bond to the sheriff in double the value of the property, and sale may be made; it is then for the party claiming ownership to bring action on the bond, and in that way the title of the property will be determined. Another method would be to bring suit upon your judgment against the judgment debtor and the party appearing to own the property, and have it determined in such suit that the property of the judgment debtor and his interest therein be made subject to the judgment.

License for Street Stand

May I place a stand for the sale of honey or other products on a public place in a city or county? Do I have to buy a license therefor, and what will the license be? — Subscriber, Owensmouth.

There is no provision against the establishment of such stands other than that certain cities may require you to take out a license therefor. As the amount of these licenses, their term and period, vary with every locality, you should ascertain from the city authorities what the rule is in the particular locality.

Wife Refuses to Move

My health has compelled me to leave the northern part of the state for Southern California. My wife wishes to stay. What can I do?—Subscriber, Walnut Creek.

It is probably impossible to force your wife to come with you; but, as the husband is considered, in law at least, to be the head of the house, he is entitled to choose any reasonable place or mode of living, and if the wife does not conform thereto, it is desertion; in case you provide such a reasonable place and the wife does not come with you on your request, she would not be entitled to receive any further support from you. It is probable that in divorce proceedings thereafter to be commenced by you, or in proceedings for the respective custody of the children, that you could procure an order requiring the children to be placed in your custody in your new place of residence, but there is no rule whereby you can cause the law to move the wife.

Community Property

According to the terms of the new community property law, can a husband or wife will their share of community property to children by former marriage without the consent of the other?—Subscriber, Watsonville.

Either husband or wife may dispose of his or her half of the community property without the consent of the other in favor of the other spouse or lineal descendants of the testator, that is to say, the husband could will property to his children by a former marriage, the wife could will property to her children by a former marriage without the other's consent.

Attention is called to the general review of recent legislation along this line in an article in this issue.

COMMUNITY PROPERTY LAW

In view of the discussion now going on with reference to the so-called community property law, which appears to be in a muddle, the following brief statement, which introduces an extended article in California Taxpayers' Journal, is of interest. It sets forth the points clearly, in nut-shell style:

"The club women of California desired at the 1919 legislature to have laws enacted giving the wife the ownership of one-half of all community property and giving her the right to dispose of the same by will; also giving the husband or wife of an insane person power to sell community property when necessary. They succeeded in having four bills passed to accomplish these results.

"Senate Bill 680 gave the desired relief to the spouse of an insane person and was approved by the governor and is now the law.

"Assembly Bill 698 gave the wife an equal ownership with her husband in the community property, and Assembly Bill 697 provided the procedure by which it might be determined by the court whether or not the wife left a will. Both of these bills were vetoed by the governor. Thus the attempt to give the wife ownership of one-half of the community property failed, and her rights are no greater than they were before.

"Senate Bill 471 provided the method by which the wife might dispose of her half of the community property by will. The governor signed this bill, but it was delayed by a referendum petition and must be voted upon by the people at the general election in 1920. This bill does not appear to be effective because the wife cannot dispose of property which she does not possess, but a discussion of the construction to be placed upon a statute is necessarily one to he maintained by members of the bar."

"NEUROPE" STAMPS

On the day the peace treaty was signed President Wilson said that the treaty "liberates great peoples who have never before been able to find the way to liberty." These great peoples have organized political governments during the period of reconstruction, and these governments are being called collectively "Neurope" by collectors. These new nations have thus far issued more than 700 varieties of stamps, some of which are already worth several hundred dollars each for the reason that they were in circulation only a brief time and because also only limited quantities of them were printed pending the appearance of definitive or permanent labels. Generally speaking, these New Europe stamps fall within the "war stamp" classification, as the war was responsible for their appearance.—Boys' Life.

The University of Arizona is issuing through its agricultural experiment station Bulletin 87, "Insect Pests of Interest to Arizona Cotton Growers". It is written by A. W. Morrill, former entomologist for the state. The bulletin has a wealth of ilustrations and full description of all the cotton pests of that section.

NEW Mitchell SIXES

Our Victory Model

A TWO-YEAR REVISION—OVER 100 IMPROVEMENTS

After 16 Years

This new Mitchell Six comes out in our 16th year of car building.

We have built and watched tens of thousands of Light Sixes. They have given the Mitchell a world-wide fame.

Now our engineers and specialists have worked two years on this new model, to embody all we have learned. There are more than 100 important improvements, based on vast experience.

You should measure up these new-day standards before you buy a fine car now.

Lasting Newness

The object of this new Six is to give you lasting newness.

Most cars satisfy when new. In this new Mitchell that newness will endure.

Part by part we have added strength. We are using better materials, new heat treatments, 123 drop forgings.

New and radical tests are now applied to every vital part. Inspection is carried to extremes.

Reducing Wear

There is finer workmanship. We have spent over $300,000 on new machinery and equipment to attain this.

There is utter smoothness in the motor, less waste of power. The crankshafts are twice balanced on two new-type machines.

Gears are perfectly mated. Transmissions are tested in a sound-proof room. Engines are tested, and for hours, with electric dynamometers.

The bodies are extra-staunch. The top will stay new. The luster of the finish is enduring. The rear springs have been proved unbreakable.

A thermosat on the motor controls temperature. The gasoline is perfectly vaporized. Thus we cut down fuel cost.

These things mean much to owners. They mean less wear, less upkeep, less operating cost. And they mean much extra service.

Learn the Facts

Ask for our catalog and learn all the improvements, or see our nearest dealer. These are qualities every car owner wants. Now so many know them that Mitchell sales are breaking all our records.

A Six like this at the Mitchell price is due to our factory efficiency. We build the complete car—motor, chassis and body—under scientific cost-reducing methods. This model plant has long been famous for them.

When you know the facts this car will be your first choice in this class. Write us today.

5-Passenger Touring Car
$1575 f. o. b. Factory
120-In. Wheelbase — 40 h. p. Motor
3-Passenger Roadster, same price
Also built as Sedan and Coupe

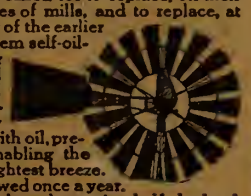
THE SELF-OILING WINDMILL

has become so popular in its first four years that thousands have been called for to replace, on their old towers, other makes of mills, and to replace, at small cost, the gearing of the earlier Aermotors, making them self-oiling. Its enclosed motor keeps in the oil and keeps out dust and rain. The Splash Oiling System constantly floods every bearing with oil, preventing wear and enabling the mill to pump in the lightest breeze. The oil supply is renewed once a year. Double Gears are used, each carrying half the load. We make Gasoline Engines, Pumps, Tanks, Water Supply Goods and Steel Frame Saws.



Write AERMOTOR CO., 2500 Twelfth St., Chicago

WINTER COVER CROP

Continued from Page 193

have actual running water during the frosty nights. This may not be possible with all, but it is possible to arrange to run the water often enough to keep the soil quite wet at this period.

There is a very great likelihood that another epidemic of mottle leaf will make its appearance in another year or two unless we have a wet winter the coming season. It has always been so, that the mottle leaf attacks have followed a series of dry winters. So we cannot afford to fail to do all that can be done to guard against this evil. The cover crop induces filling the soil up with moisture in winter and opens the soil up so that it takes in the water.

So far as we know there is nothing better for the winter cover crop than Melilotous Indica. It is hardy, free from insect enemies and diseases, keeps on coming up during the fall if it does not all get started with the first irrigation. We are told that the only rival it has is the purple vetch, but at present this is not on the market. For sandy soil which is liable to wind shifting this will be preferable to the clover. In the experiment station records this made the highest tonnage record of all, but we doubt if it will prove as hardy as the Melilotus clover. We gave up the Canada pea on account of lice and the difficulty of obtaining a stand, besides it was occasionally frost killed. The ordinary vetch was abandoned on account of the aphis. Fenugreek was good in some localities but not in all places. And so all along the line many plants have been tried, but the Melilotus clover remains the best of all.

MATURITY STANDARD FOR AVOCADOS

Continued from Page 197

best edible quality has not been determined.

According to J. M. Elliott who interviewed Rivers Brothers & Company, which purchased the bulk of the avocados blown from the trees last November, the fruits within three weeks or one month of maturity were not damaged at all and under proper conditions ripened normally. These proper conditions undoubtedly include a certain percentage of humidity as well as warmth, since dry air will cause the fruit to shrivel, dry up, and become leathery. Some persons have found that avocados ripen more uniformly and quickly if buried in bran or sawdust than in the open air.

* * *

Mr. Condit gave a summary of the maturity standards for other fruits, touching upon oranges, olives, grapes, cantaloupes, etc. He then added:

* * *

A satisfactory maturity standard for all avocados will be difficult to establish. Nature has endowed the Sharpless, Dickinson, Challenge, Spinks, and others with a fairly sure sign of maturity in the final change of color from green to purplish—or reddish—black. With those varieties which remain green throughout, the problem is more complex. An oil analysis will not suffice as such an analysis requires too much technical skill to be used widely and the individual fruits show too much variation in fat content as influenced by the long blooming period of the tree and the irregular setting of the fruit. Neither will size of fruit suffice as sizes also vary markedly on the same tree. It seems to me that the most logical basis for a workable standard is the normal date or season for maturity. Varieties have already been classified according to season, the Fuerte from January to May, the Sharpless from October to January, the Puebla from December to February, and so on. Why can not the committee on classification and registration of varieties be authorized by the directors to submit recommendations as to the earliest date at which the fruit of a commercial variety can be termed properly mature? The directors can then draw up an agreement according to which the members of the association promise not to pick and ship the fruit of any commercial variety before the maturity date specified for that variety. The containers for the fruit could then be plainly labeled, "Mature Avocados, Guaranteed by the California Avocado Association". It was some such arrangement as this, and not an iron clad contract, by which the Tulare County Protective Association secured excellent results in preventing the shipping of immature oranges. The members made it decidedly unpleasant for growers who did not make the agreement or who failed to live up to it when made. This whole subject however, of the proper maturity of avocados is one which needs thorough investigation, and it is to be hoped that such an investigation can be carried out by the association, the state experiment station, or by the United States department of agriculture.

Five Standard Automatic

Catalog No. 34

Subsoil and Chisel While the Ground is Dry

Killefer Quality

Killefer Efficiency

Subsoiling is coming to be recognized as the most successful method of opening the ground to receive the winter rainfall and conserve the moisture.

Ranchers who subsoiled last year, have reaped the benefits in increased crops over those who used the old methods. One rancher of Imperial Valley, reports a gain of from six sacks of grain per acre, to twenty-seven sacks; many others are reporting equal gains.

Our Automatic Subsoiler is a great improvement over the old style hand wheel and screw lift, as it eliminates all physical effort in raising it out of the ground. We also build the three standard subsoiler with the automatic lift.

Write for our booklet on Deep Tillage vs. Old Methods, which contains personal letters from those who have subsoiled or chiselled their land and have increased their yield from 100 to 150 per cent.

We will demonstrate our full line of Tractor Implements at the demonstration to be held at Los Angeles, September 13th to 20th.

THE RICH POOR MAN

Oh, the landscape's mine,
And the air, like wine,
And the song of the birds in the trees,
And the grateful shade
In the nooks of the glade
And the swish of the winds in the trees.

And the sunlight's mine,
All His works divine
Are mine, to have and to hold.
Nor tempting wealth,
Or the miser's pelf
Can take—they're not to be sold.

Let men worry and fret
And struggle to get—
Let them barter their honor and deal,
And pine at the loss
Of a bit of their dross—
Let them envy their neighbor his weal.

I'll go on my way
To the end of the day;
I'll knock at the poor man's door;
He has what is mine,
Contentment divine—
Soul peace—why struggle for more?
—E. M. S.

ON THE EDGE OF THE WORLD

(Concluded.)

Miss Warren's head ached and a curious trembling made her hands clumsy. At the lunch hour she found she could not force herself to eat so she slipped off to the basement where Brunner was serving hot coffee in tiny gold banded cups to the restless tide of patrons. She and Brunner had loved each other for years but marriage, on his wages, was out of the question.

"Whose funeral?" he demanded at sight of her face. "Tired?" Cheer up, pal! It can't last always!"

His smile helped more than the hot drink. "Thank you, Tom!" she whispered back. "Yes, I'm tired clear to the soul. I don't see why people who have so much of life's good things, should be so fussy and hard to please, do you?"

"Hard to stand sometimes," he nodded. "But be a 'Little Cheerup.' Keep singing!"

Slipping unobtrusively back through the crowd, her heart lifted its silent prayer for courage. Tom's smile had helped but there was no outlook. She had come to the edge of the world and Fate meant to push her off. What did it matter for herself? She could fight along somehow, go to the poor-house if need be but there was mother! God must hear her cry for help.

Prayer died from her soul at the entrance to the lace curtained alcove where so many of her hours had been spent. Hate is not the atmosphere of prayer. Like a deadly miasma this new strange emotion suddenly enveloped her as through the lace she gazed at the new saleswoman, smiling, self confident, already successful.

In her brief withdrawal Mrs. Wood Levison had come up. Mrs. Levison was the customer who must be pleased. And she was pleased! Manda had effected a sale and Mrs. Levison was looking kindly upon the girl's fresh young loveliness.

"I see Mr. Harris has made a welcome change here," she was condescending to say, her words perfectly audible to the one who paused at the door. "The person formerly in charge was most uninviting, a constant exhibition of over-taxed vitality. You, my dear—what is your name?, I shall certainly call for you in the future."

Miss Warren's glance dropped to the floor unseeingly. Her face was gray, all the fine lines of her years springing into strong relief. Yes, she had reached the edge of the world, the end of the world and the solid ground!

Frailty and fading charm must give way to youth. It was Time's sentence. It did not matter except for Mother at home, drinking her tea, knitting socks for the soldier boys, secure behind her sea-wall.

At closing time she was not surprised when a "cash" stepped from the elevator and came to her. "Number Four," she whispered importantly, "Mr. Travers told me to say Mr. Harris would see you in his office at once, if you please. Gee!" her voice dropped sibilantly. "You don't suppose you are fired?"

Miss Warren grew whiter as the child trod upon nerves aching from long-sustained anxiety. What mattered a record of long and faithful service? She had ceased to be valuable to Harris and Son. When one ceases to be valuable, one steps aside.

At once she obeyed the august summons, two red spots glowing in her face's pallor. "You sent for me, sir?" she asked. "I am Number Four, Miss Warren, of the Suits Department."

Mr. Harris turned in his swivel chair and regarded her attentively. "Sit down, please," he said. "We will come to business. There has happened a slight irregularity. I meant to see you this morning. You are not strong, Miss Warren? Travers reports twice lately you have had to be relieved to go down to our hospital."

She bowed. It was hopelessly true.

Surprisingly gentle were the next words. "You have been with us a long time, Miss Warren. Twenty years, our books say. That is a long record of faithful service!"

He turned back to his desk with an abrupt movement, and continued speaking over his shoulder. "It is evident you are no longer able to give the service we require without throwing yourself on the breakers—which isn't good business for you or for us."

"In short—" It surprised her to hear her own voice filling the pause. "In short, you do not need me any longer?"

He tapped the desk pensively. "That is about it! You will be paid two weeks in advance, in lieu of warning. Though we feel our interests require fresher talent, more vigor, we certainly appreciate all you have done in the past. We have arrangedwhat we think a liberal life-annuity and hope the arrangement will be satisfactory, for this is to be our future policy. The provision frees the really big years of your life, a condition your faithful industry has well earned. May I wish you a full and gracious Thanksgiving, my friend?"

Not knowing how she answered, she came to on the street, holding tightly a paper he had offered her. She was at the rear door and Brunner was saying something which presently cleared into speech. "I'm so glad, Velverette! You'll get strong now. I've a better position in view. Maybe our star is coming up over the edge of——"

She fell to laughing and crying softly, hidden from view by his big, comforting bulk. "Coming up, not going over the edge!" she whispered. "Tom, O Tom! Now I know God's good world has no edge. It is gloriously round and always we may go on, under the protecting shadow of His hand. I am sorry that I doubted."—The Farmer's Wife.

SPECIAL LAUNDRY PROBLEMS

Colored Clothes

Colored clothing should not be soaked or boiled. The color should be set by soaking in a strong salt solution. Avoid boiling water, lye, soda, strong soap or stain-removing agents, except of the mildest kind. Hang in the shade and iron on the wrong side, when possible.

Lace

Very delicate lace should be washed in a bag made of cheesecloth or muslin. Shaking in a bottle of soap suds is also good. Pin into shape to dry.

Silk

Avoid rubbing and wringing silk, using a gentle squeezing motion. The water should be lukewarm, containing soap solution. Bleaches, acids and strong soap or washing powder should never be used. Iron china silk wet, pongee should be ironed on the wrong side when it is almost dry.

Woolens

Prepare a tub of lukewarm water containing enough soap solution to make a light suds.

Wash by squeezing or raising and lowering in water.

Repeat, using another tub of soapy water of exactly the same temperature as the first. Avoid twisting or rubbing.

When the article is clean rinse in at least two waters of the same temperature as the others, putting two tablespoons of glycerine in the last water to restore the lustre.

Squeeze as dry as possible.

If a sweater button the front and lay backside down on a table, covered with several layers of paper and an old sheet or cloth, in a warm room or

before an open window. Pat and pull into shape, smoothing flat with the hands; fold the arms across the front if necessary. When the front is fairly dry turn the sweater backside up for a day or so until dry.

COOLING SUMMER DRINKS

By Minnie Calista Childs

If anyone hands you a lemon, take it and thank them.

Lemon Orangeade

Six lemons, three oranges, one quart of water. Squeeze juice from lemons and oranges, add water and sweeten to taste.

Lemon Frost

Use same rule as for lemon orangeade, adding one cup of tea and one pint of water instead of one quart. Pour into glasses half filled with shaved ice.

Lemon Mint

Juice of six lemons, one dozen crushed mint leaves, one quart water, sweeten to taste. Heat to boiling point, strain into pitcher, cool and serve with chipped ice. Delicious.

Spiced Lemonade

Five good sized lemons, six cloves, one stick of cinnamon. Cook cloves and cinnamon in a cupful of water, let cool and add to the water, sweeten and serve ice cold.

For Summer Fruits

Half a cup of sweetened lemon juice adds to the flavor of one quart of sliced peaches or small fruits.

THE DELICIOUS QUINCE

Old Fashioned Quince Marmalade

Pare quinces and boil until tender in a small quantity of water. Take one bowl of sugar, one bowl of cooked quinces and cook four or five hours or until deep red in color. The next day put in earthern jar (no cover) and cook four or five hours more in oven.

Quince Preserves, Southern Style

Eight pounds of quince, eight pounds of white sugar. Pare the quinces, slice from the core and simmer in clear water until tender. Remove to dishes, laying each piece by itself. Put the cores and skins in the water and boil for 20 minutes. Strain the water through a jelly bag, and into two quarts of it put a pound of white sugar for each pound of quinces; simmer gently, and when the syrup is half done, begin to cook the quinces in it, putting in only part at a time, as in peach preserves, simmering for 15 minutes and removing to dishes while the rest cooks. Proceed thus until all of the fruit is perfectly transparent, then seal up in glass jars.

Quince Dessert

Cut a slice from the blossom and stem end of six quinces, put them into a dish with enough water to cover up to half the depth of the quinces. Cover with another dish and bake in a moderate oven until the fruit is quite soft, then lift them out and place them in a glass dish. Put half a heaping tablespoon of powdered gelatine into a saucepan, add two and a half cups of boiling water, the liquor from the dish in which the quinces were baked, half a cupful of sugar and one teaspoonful of coriander seeds. Stir over the fire till they boil, strain and cool, then poul over the quinces. When ready to serve put a teaspoonful of red currant jelly on the top of each quince. Decorate with whipped and sweetened cream, flavored with half a teaspoon of almond extract.

HOUSEHOLD QUERIES

Watermelon Preserves

Please can you publish in the question and answer column of your valuable paper a recipe for watermelon preserves.—Subscriber, San Fernando.

Peel skin from the rind and cut rind into strips about two inches long; cover with water and cook until tender. Boil together ten minutes four cups vinegar and eight pounds sugar; add four tablespoons each cinnamon sticks and whole cloves (tied in cloth) and simmer until syrupy, about two hours. Add cooked melon rind and simmer one hour. Fill jars and seal. If vinegar is strong, use half water or dilute according to taste.

CLUB YOUNGSTERS EXCEL IN SCHOOL

A boy or girl who belongs to one of the clubs organized by the department of agriculture and the state colleges gets better marks in school than one who doesn't. This is the testimony of the county superintendents in the counties in which clubs have been organized as brought out by a recent inquiry in the Southern states. In Monongalia County, West Virginia, for two years a complete record has been kept of 53 club members and of the same number of pupils of the same grade and age and from the same schools. The records show that the club members in their monthly examinations have averaged 15 per cent above those who do not belong to a club, 12 per cent in attention, and 23 per cent in attendance at high school after completing the eighth grade. At the annual spelling contest in the county all the winners were club boys and girls.
